

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE NEW INTERNATIONAL YEAR BOOK

A COMPENDIUM OF THE WORLD'S
PROGRESS

FOR THE YEAR
1913

PREFACE

THE NEW INTERNATIONAL YEAR BOOK for 1913 is the seventh in the new series, which began with the 1907 volume. Like its predecessors it is designed as an encyclopædia of the year and includes many classes of information not to be found in other annual volumes of its kind. Its large size and the exclusion of matters not belonging to the year or not derived from the latest available information make this possible. For example, among departments not found or less fully represented in other such works are Biography, Agriculture, Political History at home and abroad, Societies, and Religious Bodies. While American subjects are here more fully treated than in British annuals, the international scope of the work involves more attention to foreign affairs than is given in similar American publications.

Among the important features of the year 1913, discussed in this volume, the following may be mentioned: In foreign affairs, the developments in the Balkans, the Mexican difficulty, republican progress in China, the Ulster situation, and the progress of the Home Rule Bill; in the United States, such legislative measures as the Tariff Bill, Income Tax Law, and the Currency Law; in industrial matters, the history of Trades Unions, the I. W. W., Socialism, Strikes and Lockouts, Railroads, Workmen's Compensation, Workmen's and Mothers' Pensions, Welfare Work, etc. Owing to the increased interest in the industrial and political life of the South and Central American countries, the Year Book gives special attention to topics within this field. It has also discussed at length the woman's movement both in its general aspect under Feminism and in a specific aspect under Woman's Suffrage, while recording the yearly incidents of the movement in the paragraphs entitled HISTORY under the various countries and under the separate States of the United States. Other matters of current interest which have received special attention are Safety at Sea, Railway Accidents, Aeronautics, Commission Government, Banks and Banking, Agricultural Credit, the New York Aqueduct, International and Industrial Arbitration, Insurance, and Electrical and Engineering topics.

FRANK MOORE COLBY.

EDITOR

FRANK MOORE COLBY, M. A.

ASSOCIATE EDITORS

ALLEN LEON CHURCHILL

HORATIO S. KRANS, PH. D.

LIST OF CONTRIBUTORS

AGRICULTURE, HORTICULTURE, FOODS, IRRIGATION, BOTANY, FORESTRY, ETC.

ALFRED CHARLES TRUE, PH. D., Sc. D.,
UNITED STATES DEPARTMENT OF AGRICULTURE,
AND

EDWIN WEST ALLEN, PH. D.,
UNITED STATES DEPARTMENT OF AGRICULTURE;
ASSISTED BY EXPERTS IN THE DEPARTMENT OF
AGRICULTURE AT WASHINGTON.

ANTHROPOLOGY AND ETHNOLOGY

CLARK WISSLER, PH. D.,
AMERICAN MUSEUM OF NATURAL HISTORY, AND
ROBERT H. LOWIE, PH. D.,
AMERICAN MUSEUM OF NATURAL HISTORY.

ARCHÆOLOGY

OLIVER SAMUEL TONKS, PH. D.,
PROFESSOR OF ART IN VASSAR COLLEGE.

ARCHITECTURE

A. D. F. HAMLIN, A. M., L. H. D.,
PROFESSOR OF THE HISTORY OF ARCHITECTURE,
AND EXECUTIVE HEAD, SCHOOL OF ARCHITECTURE,
COLUMBIA UNIVERSITY.

ASTRONOMY

T. W. EDMONDSON, PH. D.,
PROFESSOR OF MATHEMATICS, NEW YORK UNIVERSITY.

CHEMISTRY

JAMES LEWIS HOWE, PH. D.,
PROFESSOR OF CHEMISTRY AT WASHINGTON AND
LEE UNIVERSITY.

CHEMISTRY, INDUSTRIAL, AND EXPOSITIONS

MARCUS BENJAMIN, PH.D., Sc.D., LL.D.,
EDITOR FOR THE UNITED STATES NATIONAL
MUSEUM.

DANCES

STANLEY S. SHEIP, A. B.

DRAMA

CLAYTON HAMILTON,
DRAMATIC CRITIC FOR THE "BOOKMAN."

ECONOMIC AND POLITICAL SCIENCE

FRANK HAMILTON HANKINS, PH. D.,
ASSISTANT PROFESSOR OF ECONOMICS AND SOCIOLOGY,
CLARK COLLEGE.

EDUCATION

MILO B. HILLEGAS, PH. B.,
ASSISTANT PROFESSOR OF ELEMENTARY EDUCATION,
TEACHERS COLLEGE, COLUMBIA UNIVERSITY.

ELECTRICAL ENGINEERING

WILLIAM E. WICKENDEN, B. S.,
ASSISTANT PROFESSOR OF ELECTRICAL ENGINEERING,
MASSACHUSETTS INSTITUTE OF TECHNOLOGY.

EXPLORATION AND POLAR RESEARCH

CYRUS C. ADAMS.
MEMBER OF THE STAFF OF THE AMERICAN GEOGRAPHICAL SOCIETY,
GEOGRAPHICAL WRITER FOR THE NEW YORK "SUN."

FEMINISM

MISS JULIET STUART POYNTZ, A. M.,
ASSISTANT IN HISTORY IN BARNARD COLLEGE.

FOREIGN GAZETTEER

EDWARD LATHROP ENGLE AND
ALLAN EVA ENGLE.

FOREIGN HISTORY AND POLITICS

CARLTON H. HAYES, PH. D.,
ASSISTANT PROFESSOR OF HISTORY, COLUMBIA
UNIVERSITY.

GEOLOGY

DAVID HALE NEWLAND, A. B.,
ASSISTANT STATE GEOLOGIST, NEW YORK.

INTERNATIONAL ARBITRATION

CLINTON ROGERS WOODRUFF, LL. B.,
SECRETARY OF THE NATIONAL MUNICIPAL LEAGUE AND OF THE MOHONK CONFERENCE, AND
PRESIDENT OF THE BOARD OF PERSONAL REGISTRATION, PHILADELPHIA.

LANDSCAPE GARDENING, MOVING PICTURES, AND PHOTOGRAPHY

REGINALD GORDON.

LIBRARY PROGRESS

WILLIAM W. BISHOP, A. M.,
SUPERINTENDENT OF THE READING ROOM, LI-
BRARY OF CONGRESS, WASHINGTON, D. C.

LITERATURE, ENGLISH AND AMERI- CAN

EDWIN E. SLOSSON, PH. D.,
LITERARY EDITOR, "THE INDEPENDENT."

LITERATURE, FRENCH

ALBERT SCHINZ, PH. D.,
PROFESSOR OF FRENCH LITERATURE, BRYN MAWR
COLLEGE.

LITERATURE, GERMAN

AMELIA VON ENDE,
CONTRIBUTOR TO NEW YORK "EVENING POST"
AND "THE NATION."

LITERATURE, ITALIAN

ALBERT ARTHUR LIVINGSTON, PH. D.,
ASSISTANT PROFESSOR OF THE ROMANCE LAN-
GUAGES AND LITERATURE, COLUMBIA UNIVER-
SITY.

LITERATURE, RUSSIAN

DAVID A. MODELL, A. M.

LITERATURE, SCANDINAVIAN

HARRY V. E. PALMBLAD, A. M.,
INSTRUCTOR IN GERMANIC LANGUAGES AND LIT-
ERATURES, COLUMBIA UNIVERSITY.

LITERATURE, SPANISH

JOHN DRISCOLL FITZ-GERALD, PH. D.,
MEMBER OF THE HISPANIC SOCIETY OF AMER-
ICA, CORRESPONDING MEMBER OF THE SPANISH
ROYAL ACADEMY, ASSISTANT PROFESSOR OF RO-
MANCE LANGUAGES, UNIVERSITY OF ILLINOIS.

MANUFACTURES, CIVIL ENGINEER- ING, TECHNOLOGY, AERONAUTICS, AND FIRE PROTECTION

HERBERT TREADWELL WADE.

MEDICINE

ALBERT WARREN FERRIS, A. M., M. D.,
MEDICAL EXPERT TO STATE RESERVATION COM-
MISSIONERS AT SARATOGA SPRINGS; CONSULT-
ING PHYSICIAN, ITALIAN HOSPITAL, NEW YORK;
AND OF BINGHAMTON STATE HOSPITAL; FORMER
SENIOR RESIDENT PHYSICIAN, GLEN SPRINGS,
WATKINS, N. Y.; FORMER PRESIDENT, N. Y.
STATE COMMISSION IN LUNACY; FORMER ASSIS-
TANT IN NEUROLOGY, COLUMBIA UNIVERSITY;
FORMER ASSISTANT IN MEDICINE, NEW YORK
UNIVERSITY AND BELLEVUE HOSPITAL MEDICAL
COLLEGE; ASSISTED BY

DAVID GILBERT YATES, M. D.,
SURGEON, NEW YORK CHILDREN'S HOSPITAL;
SURGEON, DEMILT DISPENSARY, NEW YORK CITY.

MILITARY PROGRESS

C. DEW. WILLCOX,
LIEUTENANT-COLONEL, U. S. A., PROFESSOR OF
MODERN LANGUAGES, U. S. MILITARY ACADEMY.

MILITARY STATISTICS, FOREIGN

HERBERT TREADWELL WADE.

MUSIC

ALFRED REMY, M. A.,
EXTENSION LECTURER, COLUMBIA UNIVERSITY;
FORMER PROFESSOR OF HARMONY AND COUNTER-
POINT, INTERNATIONAL CONSERVATORY, NEW
YORK; LECTURER ON THE HISTORY OF MUSIC,
NEW YORK COLLEGE OF MUSIC.

NAVAL PROGRESS AND BATTLESHIPS

H. F. BRYAN,
COMMANDER, U. S. N.

PAINTING AND SCULPTURE

FORBES WATSON,
CONTRIBUTOR TO THE NEW YORK "EVENING
POST" AND "THE NATION."

PHILOLOGY

CHARLES KNAPP, PH. D.,
PROFESSOR OF CLASSICAL PHILOLOGY, BARNARD
COLLEGE, COLUMBIA UNIVERSITY; AND

JOHN LAWRENCE GERIG, A. M., PH. D.,
ASSOCIATE PROFESSOR OF CELTIC, COLUMBIA
UNIVERSITY.

PHILOSOPHY

FRANK THILLY, A. M., PH. D., LL. D.,
PROFESSOR OF PHILOSOPHY, SAGE SCHOOL OF
PHILOSOPHY, CORNELL UNIVERSITY.

PHYSICS

WILLIAM W. STIFLER, PH. D.,
INSTRUCTOR IN PHYSICS, COLUMBIA UNIVER-
SITY.

PSYCHOLOGY, PSYCHICAL RE- SEARCH, AND PSYCHOTHERAPY

MADISON BENTLEY, B. S., PH. D.,
HEAD OF THE DEPARTMENT OF PSYCHOLOGY,
UNIVERSITY OF ILLINOIS; AND

CHRISTIAN A. RUCKMICH, PH. D.,
INSTRUCTOR IN PSYCHOLOGY, UNIVERSITY OF
ILLINOIS.

RAILWAYS

WILLIAM E. HOOPER,
ASSOCIATE EDITOR, "RAILWAY AGE GAZETTE."

SANITARY ENGINEERING AND MU- NICIPAL ACTIVITIES

MOSES NELSON BAKER, PH. B., C. E.,
EDITOR OF THE "ENGINEERING NEWS."

SPORTS

CHARLES A. TAYLOR,
MEMBER OF THE STAFF OF THE NEW YORK
"TRIBUNE."

UNIVERSITIES AND COLLEGES

MILO B. HILLEGAS, PH. D.,
ASSISTANT PROFESSOR OF ELEMENTARY EDUCA-
TION, TEACHERS COLLEGE, COLUMBIA UNIVER-
SITY.

ZOOLOGY AND BIOLOGY

AARON L. TREADWELL, PH. D.,
PROFESSOR OF BIOLOGY, VASSAR COLLEGE.

NOTE: Cross references in SMALL CAPITALS indicate that the allusion is to a separate article; cross references in *italics* denote that the reference is to a subdivision of a main article. A cross reference in *italics*, standing alone in an article, carries the reference to another subdivision of the same article. The letters q. v. (*quod vide*=Latin "which see") in parentheses following a word, indicate that the subject is treated under its own name elsewhere in the volume.

NOTE: In certain tables in this work it will be found, by addition, that the totals do not correspond to the sum of the items. This is the result of the omission or inclusion of certain small items which are not mentioned in the table, but are included in the totals. This is a usage frequently employed in the compilation of government statistics, from which sources the greater number of the tables in the YEAR BOOK are taken.

THE NEW INTERNATIONAL YEAR BOOK

ABYSSINIA (ETHIOPIA). An independent east African empire. The estimates of area vary from 308,000 to 432,000 square miles. The population, estimated at between nine and eleven millions, is about one-half Abyssinians; Gallas, Somalis, Danakils, Negroes, etc., make up the remainder. Abyssinia is volcanic and mountainous, and contains some minerals—iron, coal, gold, salt, saltpetre, and sulphur. The plateaus are well watered, with a temperate climate, and grow cereals, potatoes, tobacco, fruits, etc; the lower country is excessively hot, and there sugar-cane, cotton, coffee, rubber, etc., thrive. There are good grazing grounds and cattle are raised; the prosperity of the country depends largely on its livestock. Imports by way of Jibuti: 1908, 7,700,133 francs; 1909, 10,474,717; 1911, 8,722,531. Exports: 1908, 9,469,248; 1909, 13,069,290; 1911, 11,765,844 (skins, 4,865,000; coffee, 4,567,000; ivory, 1,137,000; wax, 986,000). Imports through Italian ports (1911), 2,320,558 lire; exports, 3,072,100 lire. Imports through Gambela (Sudan), £E27,962; exports, £E37,754. The first section of the railway building under French auspices extends from Jibuti to Diré Dawa (309 kilometers, of which 219 kms. run through Abyssinian territory); the second, opened in 1913, from Diré Dawa to Meheesso (152 kms.); the third, under construction, from Meheesso to Addis Abbeha, the capital. This town has a permanent population estimated at 60,000, and a floating population of some 30,000; Harrar has 40,000, Diré Dawa 5000. There is no education. The national religion is coptic Christian (monophysitism). The emperor (negus negust) has absolute power. Menelek II. was born August 18, 1844. First king of Shoa, he became emperor in 1889. Rumors were current from time to time of the emperor's death, all of which proved unfounded, until on December 22 an authentic report of his demise was received, and Lidj Jeassu (born 1897), the son of Menelek's daughter, became emperor in his stead.

ARMY. The emperor collected from the various provinces by feudal and tribal levies a force of 60,000 men, more or less armed and disciplined, to which the men drafted from the various tribes and provinces would add some 200,000 men. Eighty per cent. of this army was infantry.

ACADEMY, FRENCH (ACADÉMIE FRANÇAISE). Of the five academies which constitute the Institute of France, this is the first. Its forty members are the last authority in matters of language, grammar, and the like, and are

generally deferred to as arbiters in the sphere of literature. In 1912, Gen. Louis Lyantey was elected to succeed Jules Henri Poincaré, and Emile Boutroux to succeed Hippolyte Langlois de Vogüé. No new members were admitted in 1913. The awarding of forty-five *prix littéraires* and forty-nine *prix de vertu* is one function of the academy.

ACADEMY OF ARTS AND LETTERS, AMERICAN. The following was the membership of the American Academy of Arts and Letters in 1913: William Dean Howells, Henry James, Henry Adams, Thomas Raynesford Lounsbury, Theodore Roosevelt, John Singer Sargent, Alfred Thayer Mahan, Daniel Chester French, John Burroughs, James Ford Rhodes, Horatio William Parker, William Milkigan Sloane, Robert Underwood Johnson, George Washington Cable, Andrew Dickson White, Henry van Dyke, William Cary Brownell, Basil Lanneau Gildersleeve, Woodrow Wilson, Arthur Twining Hadley, Henry Cabot Lodge, Francis Hopkinson Smith, Edwin Howland Blashfield, William Merritt Chase, Thomas Hastings, Hamilton Wright Mabie, Brander Matthews, Thomas Nelson Page, Elihu Vedder, George Edward Woodberry, Kenyon Cox, George Whitefield Chadwick, Abbott Handerson Thayer, John Muir, Charles Francis Adams, Henry Mills Alden, George de Forest Brush, William Rutherford Mead, John W. Alexander, Bliss Perry, Abbott Lawrence Lowell, James Whitcomb Riley, Nicholas Murray Butler, Paul Wayland Bartlett, Owen Wister, Herbert Adams, Augustus Thomas, Timothy Cole.

Timothy Cole was elected a member in June. The annual meeting of the academy was held in Chicago in November, and several interesting addresses were made. At the end of the year there were two vacancies in the membership of the academy.

ACCIDENTS. See RAILWAY ACCIDENTS, and SAFETY AT SEA.

ACCIDENTS AND DISEASES. See LABOR LEGISLATION.

ACCIDENTS, COAL MINE. See COAL.

ACCIDENTS, COMPENSATION FOR. See LABOR LEGISLATION.

ACOUSTICS. See MUSIC, *Bibliography*.

ADEN. A British possession (part of the Bombay Presidency) in southwestern Arabia; an important coaling station and the centre of trade with Arabia. Area, 75 sq. miles (of the attached island of Perim, 5); population (1911), 46,165. Area of the protected territory, about 9000 sq. miles; population, 100,000. The island of Socotra (1382 sq. miles, 12,000 inhabitants) is administered from Aden.

The total trade in 1911-1912 was £8,253,000; 1607 vessels called at Aden and 524 at Perim. The neighboring Arab tribes are subsidized by the British government, with which they have treaties. The political agent in 1913 was Major-General Sir James A. Bell.

ADMINISTRATION. See UNITED STATES.

ADULTERATION. See FOOD AND NUTRITION, *passim*.

ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE. The sixty-fourth annual meeting of the association was held in Toronto, beginning December 29, 1912. About 500 members were in attendance. At the same time meetings of several societies affiliated with the association held their meetings. These included the Astronomical and Astrophysical Societies of America and the American Botanical Society. The executive council elected 280 members and 200 fellows. Members of the association were welcomed by Governor Slaton. The annual address was delivered by the retiring president, E. C. Pickering, and was entitled "The Study of the Stars." It was voted to admit the American Forestry Association as an affiliated society. The membership of the society in 1913 was about 8100. The following officers were elected: President, Charles W. Eliot; vice-presidents (section A), H. S. White, (B) Anthony Zeleny, (D) Albert Noble, (E) U. S. Grant, (F) Frank R. Lillie, (G) G. P. Clinton, (H) Clark Wissler, (K) R. M. Pearce, (L) Paul N. Hanus, (N) L. H. Bailey; general secretary, W. C. Worsham, Jr. The meeting for 1915-16 will be held in Toronto.

ADVENTISTS, SEVENTH DAY. The chief distinctive feature of this body is a belief in the literal, personal second appearing of Christ. No specific date is set for this event. The seventh day of the week is observed as the Sabbath. The total number of communicants in the denomination in 1913 was 65,284. The churches numbered 1860 and ministers 534. There were 116 organized conferences, about 90 mission fields, about 90 advanced educational institutions, over 600 primary schools, 37 publishing houses and branches, and over 100 sanitariums and branches. The denomination publishes 125 periodicals, and issues publications in over 70 languages. Its work is carried on in about 85 countries, and it employs over 10,000 evangelists and institutional laborers. The total contributions for its work amount to about \$2,500,000 a year. The headquarters of the denomination is in Washington, D. C., where in May, 1913, was held the quadrennial session which commemorated fifty years of organized work by the denomination. At this gathering, delegates and representatives from all over the world assembled.

OTHER ADVENTISTS. In addition to the Seventh Day Adventists there are several other bodies bearing the name of adventists. These have no formal connection with the Seventh Day Adventists. The largest of these bodies is the Advent Christian, which in 1913 had 26,799 communicants, 550 churches, and 528 ministers. The Churches of God in Jesus Christ had 2124 communicants, 62 churches, and 56 ministers. The Church of God had 611 communicants, 20 churches, and 32 ministers. The Life and Advent Union had 509 communicants, 12 churches, and 12 ministers. The Evangeli-

cal Adventists had 481 communicants, 18 churches, and 8 ministers.

ÆGEAN ISLANDS. See GREECE; ITALY; TURKEY AND THE BALKAN PEOPLES.

AERONAUTICS. Under this comprehensive title stands a review of significant events concerned with the navigation of the air, and the means used therefor.

AVIATION

During 1913, a year in which the tenth anniversary of the first flight with a power-driven aeroplane was celebrated on December 17, there was widespread interest in aviation throughout Europe, evidenced by the attention paid to the remarkable long-distance flights made during the year, and to the remarkable exhibitions of Pegoud and his various imitators. These intrepid aviators, flying upside down, in circles and otherwise, in addition to furnishing thrilling spectacles demonstrated their ability to control and manœuvre the aeroplane under various conditions, proving also its safety in the hands of a competent pilot so long as it was maintained at sufficient height above the ground. Notwithstanding such interest there was, however, little progress toward general use of the aeroplane for practical purposes other than military. In the United States, doubtless owing to lack of government support and purchases of machines for the army and navy in large quantities, there was much less popular interest than in Europe.

As regards the more general application of the aeroplane a few attempts at carrying mails were made, but outside of war and navy departments there was but slight demand. In France, in fact, consternation was caused by the announcement that the war department had been carrying out the organization of a plant at Chalais-Meudon for building aeroplanes and that government machines would be constructed by it. The war department, however, abandoned the plan as not economical.

The powers had now seen the aeroplane in actual warfare as well as in manœuvres, and were planning aerial squadrons for future warfare. See MILITARY PROGRESS and NAVAL PROGRESS.

On the technical side the chief developments of the year, aside from perfecting the motors on the score of endurance and reliability, were improvement as regards stability and especially automatic stability. This was measurably secured in the Dunne, an English machine, and in an Orville Wright machine.

Progress in 1913 was towards increased endurance, reliability, and stability, strikingly evidenced in the long distance flights, such as that of Brindejone des Moulizais, who, notwithstanding storms, flew from Paris to Warsaw in ten hours and twelve minutes with but two stops, a distance of 933 miles at an average speed of 91.7 miles an hour. Almost equalling this was the flight of Stoeffler within the German Empire, where he covered a distance of 1522.36 miles in 24 hours, an average speed of 63½ miles an hour, yet in this competition eight other competitors covered over 1000 kilometers (631.37 miles). The flight of Garros from the Riviera to Africa across the Mediterranean Sea, making 550 miles in one continuous flight of nearly eight hours, was also an achievement

of merit. And again, on October 30, the Bennett cup was won by Gilbert, who flew from Paris to Puertzniz, Pomerania, a distance of 650 miles at an average speed slightly in excess of 124 miles an hour. Then, on November 24, the Russian, Vasseliëff, flew from St. Petersburg to Moscow and back, 1118.5 miles, in 10 hours and 52 minutes. Such performances, and others discussed below, demonstrated the progress in aeroplane development as regards practical long distance flight as distinguished from high speed in fair weather.

AEROPLANE MOTORS. During 1913 there was a general improvement in motors, which also involved an increase in size and power, inasmuch as there was a tendency on the part of aeroplane designers to cut down the area of supporting plane, or to arrange for increased weights. This general improvement was rather of detail than of principle, though there was considerable rivalry manifested by the various manufacturers, and the various military competitions provided opportunity for inventors of all kinds of motors for aeronautical purposes. The rotary type continued most popular, yet with the increased use of the hydro-aeroplane it was found to have disadvantages as compared with the fixed cylinder motor, since, like other air-cooled motors, it could not be protected from spray.

In connection with the development of the aeroplane motor it must be remembered that in 1907, it rarely exceeded 24 horse power, and sufficed to propel a biplane at the speed of 45 miles an hour, but in 1913 there was demanded a motor of 160 horse power, enabling a monoplane whose supporting area has been reduced to a minimum, to travel at a speed of 125 miles an hour. The tendency was rather to avoid experimentation and to employ the regular types of the most successful makers. The Gnome rotary motor maintained its preëminence, and a motor with 18 cylinders developing 200 horse power represented the leading achievement of the engineers of this company. Another motor of considerable vogue was the Le Rhone engine, supplied with a system of mechanically operated inlet valves which were not influenced by centrifugal effects. In this motor the high-resistance steel cylinders have liners of cast iron. For a motor developing 120 horse power the weight was 170 kilos (374.79 pounds), while other motors had been built whose makers claim the reduction of weight to one kilogram per horse power.

PARIS AERO SHOW OF 1913. This exhibition, held annually in the late autumn, served to illustrate the progress of the year, as the results of the most recent French experiments are usually presented. The show of 1913 was noteworthy for the absence of machines that showed a radical departure from existing types. Increased efficiency in machines that could fly at fairly high speeds with engines of small horse power was observed, but even here the results of design and study, coupled with experience, were in no way extraordinary. The supporting area of the high-speed machines was considerably reduced, while usually the engine power was increased. For example, the Ponnier machine of Vedrines had an engine rated at 160 horse power, but had a total width of supporting surface of only six meters (19.7) feet.

During the year the contest for supremacy

between the biplane and the monoplane continued and the question was still open. All of the striking feats of flying reversed and looping the loop performed by aviators in the monoplane, which had given it an apparent advantage, were repeated with the biplane and the latter type continued to be preferred by the military authorities. An interesting biplane developed during the year had a lower plane with about one-third the length of the upper to which it was braced by very stout wooden struts, while steel wires were employed for bracing the ends. It had a short fuselage built of steel tubes and the body which carried the propelling machine was an independent unit being encased in sheet steel and attached directly underneath the upper plane with the engine and propeller just behind it, so that the fore part of the body with two seats provided an uninterrupted view for the pilot and the observer. The Borel monoplane was also driven by a propeller at the rear and thus was adopted for military work carrying a small Hotchkiss gun in front, but no other obstruction for the observer and pilot. The tendency to arm aeroplanes was illustrative of their adoption for military purposes and indicated that they were acquiring a combative position, so that in future wars fighting at close range between the aeroplanes of opposing armies was most probable.

Among the novelties of the Paris exhibition was the Paul Schmitt biplane, where the planes were carried on a steel frame hinging on an axis passing through the body so that the angle of incidence could be varied and the planes tilted backwards and forwards. This biplane had three seats and had rendered a good account of itself in previous trials. An advance in construction was noted in nearly all the machines exhibited and greater care was being manifested in the building. A new material for coating the fabric of the supporting planes was used which gave a semi-transparent appearance so that the machine was almost invisible. It was hoped by certain critics that instead of cloth fabrics wood or preferably steel could be used for the supporting planes, just as for the frames steel and other metals were becoming the best practice. The tendency to reduce outside friction by soothing the external lines and building the fuselage in a conical form was further shown.

SJKORSKY AEROPLANE. The largest flying machine yet constructed was given a trial during 1913 by its designer, a Russian, named Sjkorsky, and flew for over an hour with seven passengers at St. Petersburg on August 1. This huge biplane resembled in a general way the well-known biplane of H. Farman, but had a span of 28 meters (91.86 ft.) and a length of 20 meters (65.6 ft.), affording a supporting surface of 120 square meters (143.52 square yards). The lower plane was somewhat less in span—18.04 ft.—than the upper plane. There were mounted on the lower plane four motors, each of 100 horse power and driving a propeller 2.6 meters (8.5 ft.) in diameter. These four propellers were tractor screws, which were rotated in front of the supporting surface, and in the centre there was an enclosed cabin for the pilot and passengers. The starting and alighting gear consisted of four landing skids and pneumatic-tired wheels so that the machine, which weighed with its passengers over 7000 pounds, could land and rise in safety. The tail consisted of a single surface and elevator combined,

above which were two vertical rudders, while the supporting surfaces have flaps, or ailerons. A speed of 190 kilometers (56 miles) an hour was attained and 12 passengers were carried aloft for over 15 minutes. The new biplane was purchased by the Russian war ministry and it was stated that similar machines were to be built for military service. The chief difficulty experienced was in launching and alighting, as a run of about 200 meters (656 ft.) was required before the machine could get into the air and this obviously involved a suitable ground surface. Later improvements in the running gear were effected so that greater facility was obtained. Not content with this machine the Russian designer later in the year constructed a machine with a carrying capacity of 20 persons, and with sleeping accommodations in the cabins. The machine on its trial trip was said to have risen from the ground after a run of 100 yards and to have flown and manoeuvred readily.

THE BURGESS MILITARY TRACTOR, supplied to the United States army in 1912, was duplicated in 1913 and three additional machines were ordered for the United States Army Signal Corps. This machine, known as an enclosed body tractor, carried the motor forward in a fuselage where the operator and observer sit in tandem. It had a spread of wings of 43 ft. 6 in. and a length over all of 27 ft. 9 in., weighing 1284 pounds. This machine was in military service almost constantly in the army during part of 1913, and on March 31, 1913, Lieutenant Milling, U. S. A., established an American endurance record with a passenger by a cross-country flight from Texas City to San Antonio, a distance of 236 miles, without stop, at a speed of a little over 70 miles per hour. At San Antonio Lieutenant Milling remained in the air for over an hour longer, making a record of four hours and twenty-two minutes in the air, and on the following day he returned to Texas City from San Antonio in three hours and fifty minutes.

THE WRIGHT AUTOMATIC STABILIZER. In the construction of the Wright biplane but few radical departures from the original type had been made. The more important of these were the adoption of an "open work" tail and rear elevator, and the wheels for the chassis. In the decennial year of the invention an automatic stabilizer was patented and applied to the Wright machine which operated to secure both transverse and longitudinal stability. A stabilizing pendulum was employed for the first of these objects, which by means of compressed air and a piston worked a system of interconnected cables connected with the warping mechanism and the vertical rudder. The motion of the pendulum could be checked so that erratic swinging was eliminated, but, at the same time, the action was positive and the slightest puff of wind would be counteracted immediately. Longitudinal stability was achieved by an identical compressed air servomotor which operated a small plane mid-air between the two main supporting planes, but at a different angle. This device was located directly in front of the main planes, but otherwise it acts in the main like a non-lifting tail, though when the air pressure varies as the main planes change their angle it will resist such a change through machinery which sets in operation the horizontal rudder.

Another mark of progress made during the year with the automatic control of aeroplanes was the Moreau machine, which on September 24 successfully competed for the Bonnet prize by flying half an hour without the aviator's touching the levers. This test was made in the presence of Lieutenant Lafon and during a strong wind, so that the monoplane rolled and pitched, but returned automatically to a level keel.

LONDON DAILY MAIL PRIZE FOR TRANSATLANTIC FLIGHT. In the spring of 1913, Lord Northcliffe, the proprietor of the London *Daily Mail*, offered a prize of \$50,000 for the first aeroplane flight across the Atlantic Ocean in either direction in 72 hours. The conditions of the competition required a flight between England or Ireland and any point in the United States, Canada, or Newfoundland, and permitted the aviator to alight upon the surface of the water and take on fuel, if this could be arranged for. Aviators of all nations were invited to compete and much interest was aroused among designers and air pilots. From Newfoundland to Ireland is a distance of 1800 miles so that a speed of 60 miles an hour must be maintained for 30 hours. This would involve a motor of from 150 to 200 horse power whose reliability was demonstrated beyond question. Fifty-hour continuous runs had been recorded for various airship motors, and sufficient economy in fuel had been obtained so that the question of fuel supply, while serious, was not prohibitive. It was thought that a duplicate power plant would be a possible solution of the problem and that possibly some form of hydro-aeroplane could be employed, particularly as such a craft could come to the surface of the water for repairs, or adjustment, in case of the stopping, or failure, of the motor.

THE BENNETT CUP COMPETITION. The 1913 race for the James Gordon Bennett trophy was remarkable on account of the speeds made and records broken, rather than as an international competition, as of the four competitors, with the single exception of Crombez, a Belgian, all were Frenchmen. The competition was held at Rheims on September 29 over a course of 200 kilometers (124 miles), including 20 circuits of 10 kilometers each. New world speed records for an aeroplane with pilot alone were made for distances from 10 to 200 kilometers and the time of the winner, Maurice Prevost, for the 124.777 miles was 59 minutes, 45½ seconds, or an average of 125 miles an hour, which was the fastest speed yet attained in a flying machine, being more than two miles a minute. Prevost used a Deperdussin aeroplane with a Gnome 106-horse power motor.

The second in the competition, Emil Vedrine, whose time was 1 hour, 54½ seconds, employed a Ponnier aeroplane with a Gnome 160-horse power motor, while Gilbert, and Crombez, the Belgian, who were third and fourth in the competition respectively, both used Deperdussin aeroplanes, the former with a Le Rhone 160-horse power motor and the latter with a Gnome motor of the same horse power. The weather was ideal for the competition, and Prevost, taking advantage of this, cut down the surface of his wings until they were only about 96 ft. square. Such an arrangement, while making high speed possible, was not conducive to safety, however. The following table summarizes the new records:

WORLD'S SPEED RECORDS. PILOT ALONE. PREVOST
(DEPERDUSSIN AEROPLANE—GNOME 160-
HORSE POWER MOTOR). RHEIMS, SEP-
TEMBER 29, 1913

10 kilometers (6.2 miles),	2 min. 56 3-5 sec.
20 kilometers (12.4 miles),	5 min. 54 1-5 sec.
30 kilometers (18.6 miles),	8 min. 52 1-5 sec.
40 kilometers (24.8 miles),	11 min. 50 1-5 sec.
50 kilometers (31 miles),	14 min. 48 1-5 sec.
100 kilometers (62 miles),	29 min. 40 sec.
150 kilometers (93 miles),	44 min. 38 sec.
200 kilometers (124 miles),	59 min. 45 3-5 sec.

LONG DISTANCE FLIGHTS. A notable flight across Europe was made by Brindejone Des Moulinais, who previously on February 25 had flown in a monoplane from Paris to London, 375 miles in 3 hours and 5 minutes. This more extended flight was from Paris to St. Petersburg and back, returning by way of Stockholm and Copenhagen, a distance of about 3000 miles, and was made in the interval between June 1 and July 2. A continuous flight from San Raphael, France, to Bizerta, Tunis, a distance of 558 miles, was made in a Morane aeroplane on September 23 by Roland G. Garros, the French aviator, who in the previous year had made the trip over sea between Tunis and Sicily, a distance of about 160 miles. The 1913 trip was made without the use of torpedo boats to aid the aviator in case of accident, who moreover for the trip had removed the pontoons from his aeroplane.

The last important long-distance flight of the year was completed on December 29, when Jules Vedrines reached Cairo, Egypt, after a flight of about 3500 miles. This aviator had originally left Paris with the intention of making a flight from France to Peking. On December 2 at Belgrade, Servia, which he had reached on his journey, he received a message that Pierre Daucourt, who had left Paris on October 22 on a flight from that city to Cairo, had met with an accident at Eskisher, in Asia Minor, at the beginning of an over-sea flight to Egypt in which his aeroplane was wrecked. Vedrines was urged by the Paris Aero Club to complete this flight in order to give to France the credit for the first trip between Paris and Cairo. The journey from Belgrade to Jaffa was successfully accomplished and the last installment, a distance of 250 miles to Cairo and Heliopolis, was successfully negotiated. His trip across Europe was attended by considerable excitement, as he flew over fortified places in Germany and Servia and his was the first aeroplane to arrive at Beirut.

AMERICAN AERIAL DERBY. Five aviators participated in a flight on October 13, over a course starting at Oakwood Heights, Staten Island, to and around Manhattan Island and return. The distance was estimated roughly at 60 miles and the competition was held in spite of a stiff northwest wind which was blowing at the rate of 43 miles an hour. The winner was W. S. Luckey, in a 100-horse power Curtiss biplane, whose elapsed time for the course was 52 minutes 54 seconds. The second place was taken by Frank Niles in a 100-horse power Curtiss biplane with a record of 56 minutes 55 seconds, while C. Murvin Wood, in an 80-horse power Moisant monoplane, was third with a record of 58 minutes 15 seconds. The fourth and fifth places were taken respectively by J. Guy Gilpatrick in an 80-horse power Sloane-Deperdussin monoplane and Toney Jannus in a

75-horse power Benoist biplane. There were cash prizes and silver cups for the first three aviators.

MICHELIN CUP. Several notable performances were made in the contest for the International Michelin Cup, awarded to the aviator who covered the greatest distance in any number of consecutive days flying at least 50 kilometers (31.0685 miles) a day. Finally Helen won the cup with a flight of 9996 miles in 30 consecutive days, or a much greater distance than that between the North and South poles. If Helen had received credit for nine days' flight which he lost by having to stop before reaching the timekeeper he would have flown 20,787 kilometers (13,537.79 miles) in 39 consecutive days.

HEIGHT RECORDS. The height record was increased during the year by Perreyon in a 160-horse power Blériot monoplane, who rose to a height of 19,685 ft. above the earth, or about 3¾ miles. This performance was eclipsed during the last week of December by Legagneux, the French aviator, who on December 27 at Frejus climbed in a monoplane to a height of 20,668 feet in 1 hour and 40 minutes. M. Legagneux had held the record of 17,873 feet made on September 17, 1912. The height record for two passengers in addition to the aviator was raised to 11,740 feet by von Blaschke in Austria on June 29, 1913, while during the year all records with passengers up to six in number were broken.

During the year 1913 much attention was paid to remarkable performances in the air by various aviators. Notable among these was the looping the loop in a monoplane by the French aviator, Pegoud, who, using a Blériot monoplane, on September 2 was able to show that he could fly upside down, dive headlong, and rise vertically, forming a complete loop, roll over sidewise, and slide tail first backwards and make a quick recovery so as to dive head-first to a normal position. Pegoud's achievements were straightway followed by other aviators, both in Europe and the United States, notable among whom was Lincoln Beachey who on December 25, "looped the loop" five consecutive times from a height of 750 feet and turned a double loop at a height of but 300 feet.

Among the interesting applications of the aeroplane was the inauguration of a regular aerial mail service in France on October 15, when mails were carried from Paris to Bordeaux to catch the West Indian boat with a considerable saving of time. Later in the year an experimental aerial transport of mail across the desert of Sahara was being planned by the French National Aerial League. The route extended from Oran, Algeria, to Timbuctu, a distance of 1400 miles and the flight was designed to show the practicability of a regular service. In the United States an interesting application was made of the aeroplane in its use for patrolling the right of way of an electric transmission line in California. This was attempted on the line of the Great Western Power Company of San Francisco, which extends from Big Bend on the Feather River across sloughs and marshes of the Suisun Basin, and finally over the Coast Range to Oakland, a distance of 160 miles. As much of the marsh is impassable, great delays are caused when breaks occur in the inaccessible locations, and by the new arrangement a lineman accompanies the aviator so that where a break is noted he can land and

make the necessary repairs. The machine used was of the modified Wright model and a speed of 40 miles per hour was obtained and, in addition to the aviator and lineman, a kit of tools for the latter is carried. A portable telephone was also used so that connection could be made with headquarters in case of a serious break requiring more attention than the traveling lineman could give it. Two trips a week were planned and this form of inspection was begun on November 20.

HYDRO-AEROPLANES

The second international annual competition of hydro-aeroplanes was held at Monaco beginning April 3, 1913. Sixteen machines qualified for the competition and the meeting was interesting as showing the development made in aeroplanes leading to increased sea-worthiness, for it was required that hydro-aeroplanes must perform satisfactorily on the surface of the water as well as in flight. Early in the meeting a heavy gale prevented any flying and required the hydro-aeroplanes, with two exceptions, to seek shelter. The Deperdussin hydro-aeroplane, of Prevost, and the foldable wing monoplane of de Marçay were able to ride out the storm at their moorings. The competition was divided under six different heads. First, starting from a stationary position on the water with the motor stopped; second, altitude test to show the ability of the machine to rise to a height of at least 500 meters (1640 feet) and return to the water in less than thirty minutes; third, volplane test in which the plane having risen to the height of at least 100 meters must shut off power and glide to the surface; fourth, a handling test where the machine must be brought to the crane of a ship, or pier, and fastened to the same so that it can be raised and lowered without damage; fifth, towing test where the hydro-aeroplane must be towed by a rowboat, or motorboat; and sixth, a navigable test where a course of $6\frac{1}{4}$ kilometers must be covered under the aeroplane's own power without leaving the surface of the water. The race for the Jacques Schneider international aviation cup for hydro-aeroplanes was held on April 17, and was won by Maurice Prevost on his Deperdussin monoplane equipped with a 160-horse power Gnome motor. In addition to the cup there was a cash prize of \$5000 and on account of the number of contestants representing different countries, the race partook of an international character. The course was 150 nautical miles, and while there were numerous motor failures which detracted from the contest as such, nevertheless it showed both the safety of the hydro-aeroplane and its utility.

The hydro-aeroplanes represented naturally carried out the fundamental ideas of their designers irrespective of their application to over-sea flight. They were well engineered and showed considerable strength. In the float equipment, however, there was considerable diversity and much of an experimental nature. The Breguet biplane had but a single float, while in the case of the other machines two floats were used, either cylindrical or flattening on the bottom. There is always a small float at the tail of the machine whether one, or two, are employed under the planes themselves. If the floats are flat and scow shaped they are made of wood or veneer, but with cylindrical floats metal is employed.

NEW WRIGHT HYDRO-AEROPLANE. In 1907 the Wright Brothers conducted early experiments on hydro-aeroplanes on the Miami River, Ohio, but the complete development of this type of aeroplane was reserved until the year 1913 when Orville Wright succeeded in bringing out a new type known as the "C.H." Mr. Wright's experiments were concerned with a hydro-aeroplane adapted to flying from small inland rivers and lakes rather than with a machine for rough water flying. In other words, he aimed to produce a craft more air-worthy than any yet adopted, for he realized that perfect flight must be possible with the trees and high banks usually found on inland rivers and lakes which otherwise would be a cause of danger to an aviator. The new Wright hydro-aeroplane was a biplane following the usual Wright model with a large centre float and a rear float of novel design and construction. The span was 38 feet, chord 6 feet, and the surface area was about 440 square feet. The weight, empty, is 920 pounds, exclusive of the weight of the centre hydro-aeroplane float which is 240 pounds. This was a single pontoon, 10 feet in length, 6 feet wide, and 10 inches deep. The power was supplied by a new Wright 6-cylinder 60-horse power motor, driving two propellers, and all the details have been worked out with special care as regards the balancing and arrangement of planes and floats. It was possible to rise almost instantly from the top of the water and in less than 10 seconds from cranking Mr. Wright was able to leave the surface.

BURGESS NAVAL FLYING BOAT. To meet the requirements of the United States navy for a flying machine capable of carrying a large load at high speed a new type of flying boat was designed by W. Starling Burgess during 1913 and was tested and accepted by the United States government. Ease of manœuvring, both in the water and in the air, and facility of dissembling and dismantling were elements in the specifications. The hull, power plant, and main surfaces each formed separate units. Among the innovations were the triangular arrangement of wing struts allowing the upper plane to be staggered forward of the lower plane, thus increasing its efficiency, and a hinging arrangement of the rear diagonal strut so that the upper and lower wing surfaces, while permanently attached to each other, could be folded together for dissembling. The boat was in two sections, the front scow shaped and fastened to the rear section so that they could be easily and quickly separated for shipment, while the power section was arranged so that the engine and its stand could be removed from the boat.

The principal dimensions of the Burgess naval boat were as follows:

Spread of upper wings	43 feet
Spread of lower wings	36 feet
Depth of wings	5 feet, 6 in.
Area of supporting surface	397 square feet
Length over all	31 feet
Length of hull	29 feet, 6 in.
Height	8 feet, 10 in.

In the acceptance test sufficient stability to provide for riding adrift safely in a 20-mile breeze in open water was required and this was fulfilled, as well as the stability to carry sufficient fuel and oil for a flight of four hours and a 400-pound useful load in addition. The speed requirement of 55 miles per hour with full

HYDROAÉROPLANES

1. CURTISS FLYING BOAT
2. BURGESS COAST DEFENSE HYDROAÉROPLANE OF U. S. ARMY SIGNAL CORPS
3. WRIGHT HYDROAÉROPLANE, MODEL C-H.

load was accepted in the acceptance test when a mean speed of 58.4 miles was developed in an irregular 13-mile breeze. For the endurance test a flight of one hour and nine minutes was made during which 58¾ pounds of gasoline were consumed.

The flying boat answered the requirements of rising from the water with full load in a calm during a run of not more than 1500 ft. by rising in less than 1400 ft. and was able to climb to an altitude of 1500 ft. at the rate of about 132 ft. per minute, which also was in excess of the specification requirements. Gliding was also successfully accomplished by the machine's gliding from 500 ft. to a distance of approximately 2475 ft. in a five-mile breeze. For short runs of light loading a speed of over 65 miles an hour was developed. The tests were made over a five-mile triangular course in a wind that varied from six to ten miles per hour and were made from May 13 to 17.

The Burgess Company and Curtiss, of Marblehead, Mass., also built a coast defense hydro-aeroplane for the United States Signal Corps which was delivered on January 20, 1913. This hydro-aeroplane had a long enclosed body with seats for aviator and observer along a fore and aft line with the power plant located amidships in the cock-pit behind the crew. Two propellers were driven from a six-cylinder Sturtevant motor by a chain transmission and there were an elevator and double rudder. The principal dimensions of this hydro-aeroplane are as follows:

Spread of wings	39 feet, 10 in.
Length over all	31 feet, 4 in.
Length of enclosed body	29 feet, 7 in.
Height from bottom of hull	9 feet, 6 in.
Depth of wing	6 feet, 3 in.
Area of main surfaces	484 square feet
Weight, empty	1500 pounds

The floats, or hydroplanes, were two in number, made of mahogany reinforced by copper. They were 22 inches in beam, 17 feet 2 inches in length, and had a maximum draft of 9 inches. This hydro-aeroplane was subjected to speed and endurance tests during January, 1913, and developed a speed of 59 2-10 miles per hour over a measured course. The engine which was subjected to an endurance test in the air of 2 hours and 16 minutes continuous flight, performed successfully. The weight carried on the altitude test was 651 pounds, independent of the fuselage and the machine itself.

During the year a large hydro-aeroplane was built in France by Collioux for M. Jeansson and was tested during the summer. It was 53 ft., 6 in. in length over all and weighed complete 9460 pounds. It was of biplane form with two sets of planes, one behind the other, mounted upon a 22-ft. hull, the propeller being placed between the two sets of planes. The rear plane had a spread of 78.6 feet, while those in front were from 15 to 18 ft. less. Ailerons were fitted to the upper rear plane to control the transverse stability. In addition to the main pontoon there were cylindrical floats between each end of the main biplane. There were two 230-horse power Chenu six-cylinder engines placed side by side behind a two-bladed 14-ft. 5-in. propeller. While this waterplane was not completed in time for the competition at Monaco, yet it was thought to present features of design that would prove useful in long over-sea trips.

DIRIGIBLE BALLOONS

The record of the year with regard to dirigibles was one notably of achievement, but also of misfortune and catastrophe. At the same time, from these shocking disasters much was learned, especially in the case of the latest German dirigible, *L. II.*, whose destruction through an explosion is noted below. The error of design causing this accident was one that could be remedied without the slightest trouble and a repetition could be guarded against. The largest German dirigibles at the end of the year had beyond question sufficient capacity to cross the Atlantic, as a maximum speed of between 55 and 60 miles an hour was obtained, and adequate supplies of food and fuel could be transported. In this connection it is interesting to consider how step by step the range of the airship had increased. On June 9, 1913, the seventeenth Zeppelin airship *Saxon* made a trip from Baden-Baden to Vienna, a distance of 435 miles in eight hours' time, or an average speed of 54½ miles an hour. The airship on this journey was under the direction of Count von Zeppelin himself and carried twenty-four passengers on a visit to Emperor Francis Joseph of Austria. They left Baden-Baden at three in the morning and arrived at Vienna at eleven, or in about one-half of the time required by an express train for the journey. Notwithstanding stormy weather on the following day a successful return trip was made to Friedrichshafen.

ZEPPELIN AIRSHIPS

LOSS OF THE "L. I." The great interest aroused during the year in the Zeppelin airships on account of their extensive use and their apparent continued success was somewhat disturbed by two disastrous catastrophes in Germany, in which naval dirigibles were wrecked and their crews perished. The first attempt to use a dirigible in regular sea service by naval officers was with the Zeppelin airship *L. I.*, which, since its first ascent from Friedrichshafen on October 7, 1912, had been in use for nearly a year in the German navy, and had made frequent trips. On this occasion, being equipped with wireless apparatus, searchlight, and machine guns, together with supplies, there was carried a load greater than was originally intended. The *L. I.*, 565 feet in length and 50 feet in diameter, and driven by three Maybach motors with an aggregate of over 500 horse power, was capable of a speed of 52 miles an hour. It had a displacement of 22 tons and the 18 separate gas chambers contained 776,000 cubic feet of gas. This airship was destroyed during the naval manœuvres of the German high sea fleet on the afternoon of September 9, 1913, twenty nautical miles to the northwest of the island of Heligoland, and 15 members of its crew of 22 men perished. It had left the harbor of Hamburg at 1:30 P. M. to participate in the night manœuvres of the German fleet. Starting out from its anchorage in bright sunshine, the airship put to sea and soon encountered rain and stiff winds. As a result the gas shrank, decreasing the buoyancy of the balloon, and the moisture deposited on the envelope and the hull added greatly to its weight. It was impossible to discharge the ballast and lading with sufficient speed, and with the onset of a heavy gust which struck the airship amidships all efforts at

manœuvring in the face of the severe wind were fruitless. The airship was hurled down on the waves and struck the raging sea while running at high speed so that the impact crushed the bows, while the waves soon destroyed each single gas compartment, which was torn loose from the aluminum frame. Among the officers and crew who were lost were the commander, Captain Hanne; Captain Metzger, commander of the marine airship *Duisen*, and Baron von Maltzahn.

WRECK OF "L. II." As a result of this accident more interest attached to the performance of the Zeppelin *L. II.*, a later construction for the German navy, which represented the most recent developments in this class of huge dirigibles, the aim being to provide increased "weatherworthiness." The *L. II.* had a displacement of 29,337 cubic yards, a length of 487 feet, and a beam of 50 feet. Its balloon carried three cars, the third being an innovation, with the aim of a more even distribution of the weight. The third car was used only for navigating and contained the wheelhouse, chart-room, and other equipment. The passageway connecting the three cars was located in the interior of the hull and the cars themselves were placed nearer to the hull than in previous airships. The *L. II.* was driven by four separate engines arranged in groups of two in each car, and by the use of Maybach motors with a maximum of 225 horse power each, a total of 900 horse power for the new ship was developed.

It was the hope of the designers that this airship might cross the ocean from Europe to America in safety and the first trial trip proved entirely satisfactory. Whatever hopes in this direction were held, however, were rudely shattered by the destruction of the *L. II.*, which, on October 17, 1913, exploded and burned in mid-air, with the loss of the entire ship's company, twenty-eight officers and men, including members of the admiralty board who were conducting official tests of the airship for the government. This frightful disaster was due, according to the expert report of Dr. Eckener, to the ignition in the forward engine car by a spark, or otherwise, of a layer of explosive air hydrogen mixture which enveloped the car. This was caused, in part, by the peculiar construction of the vessel, which Count Zeppelin did not consider as safe as his earlier constructions. A dead space was formed behind the screens in which the air and hydrogen accumulated.

From a published report of the work of the Zeppelin passenger airship *Victoria-Louise* it was possible to discuss the economic possibilities of aerial transportation by a large dirigible. Between March 4, 1912, and November 26, 1913, this vessel made 400 trips, covering all told a distance of 29,413 miles and aggregating 852 hours. During this time she carried 8551 passengers, and used 18,550 gallons of gasoline, 15,276,000 cubic feet of hydrogen, and 2123 gallons of lubricating oil. Counting these items at their current values in Europe, a writer in the *Engineer* (London) argued that the running charges during the period covered must have amounted to: Gasoline, £1391; hydrogen, £7638; oil, £472; total, £9501. The cost of fuel oil and gas thus amounted to £11 3s. per hour of flight. The average speed was about 35 miles an hour, and the average number of passengers carried about 21. Hence, per passenger miles,

these three items of the running charges represented an expenditure of over 3½d. Add to this, says the writer, the wages of the crew, the interest on the capital, and the depreciation of the airship and its sheds, and one can well believe that aerial journeys of this nature cannot hope to rival other modes of transport on a financial basis.

Since the beginning of the passenger service in June, 1910, up to the end of September, 1913, seven Zeppelin dirigibles had been employed in passenger service, and out of 1218 days the total time spent in the air figured out 100 entire days, in which a distance of 81,375 miles was made, or about three times around the globe, and 23,271 passengers were carried without injury.

In addition to the Zeppelin airships the German army had other patterns, and the second Schütte-Lanz airship was completed during the year 1913. It contained 847,000 cubic feet of gas and carried five cars, one in front for the commander and four for the crew, two of the latter being loosely suspended in the centre line fore and aft and the other two rigidly fixed on each side of the centre line. Three Maybach and one Daimler motors drove the ship, each motor being connected with two propellers. The estimated speed was 45 miles per hour. The *Schütte-Lanz I.* was wrecked by being torn loose from an anchorage at Schneidermühl on a trip from Berlin to Königsberg in July. Descending for repairs, the dirigible was struck by a violent gust of wind and carried away from its fastenings and from the grasp of the soldiers summoned for the emergency. The airship was borne aloft for nearly an hour, when it was driven to the earth and demolished by collision with a forest.

The Parseval airship, one of the most successful to be developed in Germany, continued to be improved, and a dirigible made in 1913 by the Berlin Airship Company at the Berlin shipyard was the seventeenth of this type. It was like the others of this type, flexible, but with a more slender envelope, and it was driven by two propellers placed to the right and left and above the suspended car. Each propeller had four blades of elastic steel 1-25th of an inch thick and was driven by a six-cylinder Maybach motor, the group having an aggregate power of from 300 to 320 horse power.

SPHERICAL BALLOONS, OR AEROSTATS

The distance record for non-dirigible balloons made by Bienaimé, the French aeronaut, in 1912, of 1361½ miles, was broken by E. Rumpelmayer and Mme. Goldschmidt, who made a flight of 1503 miles from Lamotte to Eharkob, Russia, March 19 to 21. This in turn, as well as the duration record, was exceeded on December 13 by Kaulen in the German balloon *Duisburg*, with two passengers. Starting from Bitterfeld in Prussian Saxony, he made a flight of 1740 miles in 87 hours, landing at Perm on the border between European and Asiatic Russia.

A notable altitude ascension was made on May 28, 1913, when MM. Bienaimé, Jacques Schneider, and Albert Senouque ascended from Lamotte-Breuil in the balloon *Icare* to an altitude of over 10,000 meters, or nearly 33,000 feet. The aviators made use of oxygen respiration apparatus and were bundled up to resist the intense cold at the extreme altitude. This

THE GERMAN MILITARY DIRIGIBLE ZEPPELIN AIRSHIP "Z-4"
FORCED TO MAKE A LANDING IN FRENCH TERRITORY NEAR LUNÉVILLE IN APRIL. THIS AIRSHIP WAS TYPICAL OF THE GROUP OF LARGE PASSENGER-
CARRYING DIRIGIBLES WHICH WERE IN SERVICE IN 1913

ascent for altitude shares the honors with one made in 1901 by Suring and Berson at Berlin, in which an altitude of 10,800 meters (34,433 feet) was attained.

GORDON BENNETT CUP FOR BALLOONS. The international race for spherical balloons or aerostats was started from Paris, October 12, 1913. By reason of the cup having been won in the previous year by the French balloon *Picardie*, of M. Bienaimé, in 1913, there were eighteen entries and the competition was won by the American balloon *Goodyear*, with Ralph H. Upson, pilot, and Ralph A. D. Preston, aide. The distance made was about 500 miles. The English Channel was crossed and a landing was made on the northeast coast of England, near Flamborough Head on the Bampton Cliffs, the descent being due to bad weather conditions. The second in the competition was also an American balloon, the *Uncle Sam*, of Captain H. E. Honeywell, which made a flight of about 282 miles, landing on the French coast south of Brest. The third was the Italian balloon of Agostini, which also descended on the French coast. It is apparent from the above statement that the 1913 competition in interest and achievement ranked far below those of previous years.

THE NATIONAL BALLOON RACE for spherical balloons in the United States for 1913 was started from Kansas City, Mo., July 4, and was won by the balloon *Goodyear*, R. H. Upson, pilot, R. A. D. Preston, aide. The other contesting balloons and their pilots were: *Kansas City II*, John Watts; *Kansas City Post*, H. E. Honeywell; and *Million Population Club*, Captain John Berry. The successful balloon, the *Goodyear*, which started at 7:21 P. M., descended 7 miles east of W. Branch, Mich., at 3:17 P. M. of the following day, having made a distance of 647½ miles.

THE LANGLEY AERODYNAMICAL LABORATORY. A fitting memorial to Professor S. P. Langley, for many years secretary of the Smithsonian Institution and a pioneer worker in modern aeronautical science, was the reopening of the Langley Aerodynamical Laboratory, authorized by the board of regents of the Smithsonian Institution, at a meeting held on May 1, 1913, together with the appointment of an advisory committee and the addition of other laboratories and facilities as means were available. The board of regents made an appropriation of \$10,000 for the initial year and promised an appropriation of \$5000 annually for five successive years. Dr. Alfred F. Zahm, the well-known authority on aviation and aeronautics, was made recorder of the advisory committee, with an office in the Smithsonian Building, and it was intended to coördinate and make available for scientific and general purposes the facilities of the United States government for aeronautical research in such departments as the army and navy, the weather bureau, and the bureau of standards. The new laboratory may exercise its functions for the government in any of its departments, as well as for various individuals who shall defray the expense accruing from any such services rendered, and has as its object the promotion of research and experiments to increase the safety and effectiveness of aerial locomotion. It contemplated a series of publications and an annual report which would give the results of the researches at its laboratory and the general and sub-committees interested in its control. It is to be remembered that much of

Dr. Langley's experimental work was carried on in the laboratories of the Smithsonian Institution and that there were built the large model aerodrome, which flew successfully, as well as his later man-carrying aeroplane. While the Langley laboratory started in somewhat modest form, yet it was hoped that its usefulness and facilities would develop so that it would take a rank with the national and private laboratories of Europe.

UPHOLDING THE WRIGHT CLAIMS. Progress in the litigation to determine the validity of the Wright patents was marked in the decision handed down on February 27, 1913, by Judge John R. Hazel, of the United States District Court of the Western District of New York, by which the claims of the Wright Company in its suit against the Herring-Curtiss Company and Glen H. Curtiss were in large part sustained. This by no means settled the matter, as the judge stated that a stay of proceedings would be granted pending the appeal which the Curtiss interests might undertake. It will be recalled that an injunction in this matter was first granted on January 23, 1910, on the score of an infringement of the Wright patent, and a few months later the Federal Circuit Court of Appeals held that the preliminary injunction was not warranted by the proof. The 1912 decision came after a trial of the merits of the case in court, and while it did not finally settle the question, it was a substantial victory for the Wright interests, which was further emphasized by favorable court decisions in Europe also. The decision dealt in detail with the history of the development of the art of aviation and of the patents that have marked its progress.

The main question at issue was, were the Wrights the first to discover that the vertical rudder of a flying machine must be used in conjunction with wing warping devices, or ailerons, to prevent the machine from spinning on the vertical axis? In the opinion of the court the Wrights were entitled to the invention of this discovery, and the Curtiss claim infringed the patent. Of the eighteen claims made in the Wright patent, four claims were held to be infringed.

The conclusion of Judge Hazel's decision was as follows:

"The defendants have embodied in their aeroplane the various elements of the claims in suit (Nos. 3, 7, 14, and 15 of the Wright patent). While it is true, as pointed out herein, that the defendants have constructed their machine somewhat differently from complainant's and do not at all times and on all occasions operate the same on the Wright principle, yet the changes they have made in their construction relate to form only. They have constructed their machine so that it is capable of restoring equilibrium in substantially the same way as is complainant's machine, and the evidence is that, on occasions, they use the vertical rudder not only to steer the machine, but to assist the ailerons in restoring balance. . . . The questions of law in the case are important, but the questions of fact are controlling, and in view of the novelty of the claims and their scope, the question of the infringement is resolved adversely to the defendants as to the claims which are the subject of this controversy." The court then provided for entering a decree, but, as stated, granted the Curtiss interests a stay of pro-

ceedings, pending appeal, which was duly taken, and a decision was expected early in 1914.

That aviation presents problems for legislation even in the United States was shown by the fact that on May 17, 1913, Governor Foss of Massachusetts signed a bill regulating the licensing and operating of aircraft in that commonwealth. This act makes it unlawful for any aviator or other person to operate an aeroplane, or other craft of any kind, unless licensed so to do by the Massachusetts Highway Commission, except with a licensed pilot, and then not for a distance exceeding 500 miles. The license fee and the qualifications are described by the act, which also requires an inspection of an aeroplane by an official inspector, its registry, and the issue of a registered number. Detailed rules and regulations for flying are prescribed.

In Great Britain aerial navigation acts were passed in 1911 and 1913 and under their terms regulations for aircraft were published. The entry of foreign aeroplanes or airships, except by certain routes, into Great Britain, was forbidden and certain localities were entirely forbidden to aircraft operated by civilians, as well as flying over London within a radius of four miles from Charing Cross. Regulations for aerial traffic were adopted at a conference of the International Aeronautical Federation and regulations for the marking of aircraft and the lights to be carried for night flying, as well as rules of the route, were adopted.

INTERNATIONAL PILOTS' CERTIFICATES. The conditions for the award of aviators' certificates prescribed by the *Fédération Aéronautique Internationale* required two flights, each consisting of five figure 8's around two marks situated 500 meters apart and alighting within a distance of 50 meters from a point previously indicated. An altitude of 50 meters must be obtained in one of the two flights, or a separate altitude flight must be made. It was announced during the year that after January 1, 1914, international qualifications for an aviator's certificate would involve the attainment of an altitude of 100 meters and a descent from that height with the engine stopped. The various national organizations have, in addition, their own requirements for the award of certificates, and so have the aviation corps of the various armies. In the United States, to become effective January 1, 1914, the increased requirements for a military aviator were prescribed by the chief of the Signal Corps and approved by the Secretary of War.

AMERICAN PILOTS' CERTIFICATES. The Aero Club of America, which represents in America the *Fédération Aéronautique Internationale*, reported the following statistics as to the pilots' certificates issued on October 31, 1913: Spherical balloon, 48; dirigible balloon, 3; aviation, 243; hydro-aeroplane, 13; expert, 12; total, 319.

FATALITIES. Among the important fatalities of the year in aviation was the death of Col. S. F. Cody, a British citizen of American birth, who had become prominent in the design and direction of aviation for the British army. While flying in a monoplane at Aldershot on August 7 Colonel Cody and a passenger named Evans met with an accident by which they were thrown to the ground from a height of about 200 feet and instantly killed.

Perreyon, the chief pilot and tester of the Blériot school at Étampes, also was killed, as well as Charles Nieuport, the famous designer.

In the United States the more serious fatalities were of army and navy officers. On April 8 Lieut. Rex Chandler, U. S. N., was drowned at San Diego, Cal.; on June 20 Ensign W. Billingsley was wrecked in a wind gust at Annapolis; on November 14 Lieut. C. P. Rich, U. S. A., was killed at Manila through engine trouble, while on November 24 Lieutenants H. M. Kelly and E. L. Ellington, U. S. N., losing control of their machine at San Diego, perished.

AFGHANISTAN. A monarchy of central Asia, covering the northeastern part of the Iran plateau. Its four principal provinces are Kabul, Turkestan, Herat, and Kandahar. The population (4,500,000-5,000,000,) are turbulent tribesmen, mostly Suni Mohammedans by religion. The ameer is Hubibullah Khan. A treaty between Great Britain and the ameer, confirmed in 1905, provided that, in relations with other countries, the ameer should act in accordance with the wishes of the British government, which, for its part, would guarantee him against foreign aggression. The Anglo-Russian convention of 1907 acquiesced in this situation, Russia agreeing to act in political matters through the British government, with the understanding that the two countries concerned should trade with Afghanistan on equal terms.

The manufactures are chiefly silks, felts, camels'-hair goods, and carpets. The exports consist chiefly of asafoetida, raw wool, madder, cereals, fruits, furs, shawls, and chintz. Important industries are agriculture and stock-raising. Exports to India in 1912 were £652,655. Imports from India were £877,096.

AGRICULTURAL COLLEGES. See **UNITED STATES DEPARTMENT OF AGRICULTURE**.

AGRICULTURAL CREDIT. The past few years have seen very notable development of interest in the problem of increasing the credit facilities of farmers. The leaders of opinion have been former Governor Herrick of Ohio, afterward ambassador to France; Mr. David Lubin, organizer of the International Institute of Agriculture; ex-President William H. Taft, the Southern Commercial Congress, and Senator Fletcher. President Taft late in 1912 had pointed out that American farmers borrow annually over \$6,000,000,000, upon which they pay an average rate of 8½ per cent. French and German farmers, on the other hand, pay only 3½ to 4½ per cent. The Southern Commercial Congress, in which twenty-seven States were represented, had made plans in 1912 to send abroad the investigating commission noted be-

low. In California a special rural credits commission to study European systems was created in 1913. In Canada the Saskatchewan government appointed a commission, which found the average interest rate in that province to be over 8 per cent. It was found that one-half of the farm foreclosures in fifteen months preceding September, 1913, were based on loans bearing 10 to 12 per cent. There was an abundance of facts to show that both in Canada and the United States farmers need credit facilities whereby they may secure long-term loans for the purchase of land, farm implements, machinery, stock, and other equipment, and short-term loans for government operations.

AMERICAN COMMISSION. The American Commission for the Study of the Application of the Coöperative System of Agricultural Production, Distribution, and Finance in European Countries, organized by the Southern Commercial Congress, consisted of nearly 100 members, representing about three-fourths of the States and Canada. It sailed from New York April 26 and returned about August 1. It had the support of a congressional resolution requesting European diplomatic courtesies. It was also greatly strengthened by a commission of seven authorized by a \$25,000 appropriation by Congress and appointed by President Wilson. This was known as the Federal Commission on Rural Credits and consisted of the following men: Chairman, Senator Duncan Fletcher of Florida, president of the Southern Commercial Congress and also chairman of the American commission; Senator Gore, of Oklahoma; Congressman Moss, of Indiana; Clarence A. Owens, of Maryland; President Kenyon L. Butterfield, of the Massachusetts Agricultural College; Professor John Lee Colter, of Minnesota, and Col. Harvie Jordan, of Georgia, president of the Southern Cotton Growers' Association. Mr. Sevellon Brown was sent as the official representative of the Department of State. The report of the American commission was to be made to the Southern Commercial Congress. The report of the Federal commission was partially embodied in a bill presented by Senator Fletcher on August 9. This proposed a system of local national rural banks owned and operated by farmers; a rural national bank in each State, to be owned and controlled by the local banks as stockholders; and a national rural bank of the United States located in Washington and owned entirely by the State rural banks. The supervision of these banks was to be under a special division of the Treasury Department with a rural banking board and a director of rural banking. The bill embodied features of the *Landschaft* and *Raiffeissen* systems of Germany, to which Senator Fletcher in a speech directed the especial attention of Congress and the country. Those most interested desired to have sections on farm credit attached to the currency bill. President Wilson and the finance leaders, however, decided to postpone action to the regular session, promising that farm credits should be one of the first items considered.

MASSACHUSETTS. The report of the bank commissioner of Massachusetts showed that credit unions among farmers were being formed in that State. In four years twenty-six unions with 2862 members and total assets October 31, 1913, of \$94,080 had been formed. They made loans to 752 members in the last year. It was the opinion of the commissioner that such unions

were certain to develop rapidly when their advantages became better known.

LUBIN'S PROPOSAL. Mr. David Lubin, for many years delegate of the United States to the International Institute of Agriculture at Rome, Italy, has been very active in the cause of agricultural credit. His scheme is the adaptation of the German *Landschaft* system to American conditions. He laid down the following traits of any system of rural credit worthy of consideration: The economic advantage of all parties concerned; perfect safety without artificial guarantees; simplicity of method in making loans; ready detection of any departure from prescribed routine; and institution without class legislation, government funds, or government guarantee. He pointed out that the *Landschaft* transacts no banking business. It is formed by a body of citizens of a certain locality, and its almost entire function is to exchange its bonds for land mortgages. The borrower then sells its bond in the open market, using the proceeds for his agricultural purposes. The borrower thereafter pays the *Landschaft* interest and amortization until his debt is extinguished. Failure on his part gives the *Landschaft* possession of his land, without recourse to any lawsuit. The bonds of the *Landschaft* bear 3, 3½, and 4 per cent.; yet they have recently commanded higher prices than German government bonds bearing the same interest rate. Mr. Lubin pointed out that the institution of such a system in this country would require the enactment of uniform State or national laws with reference to land titles; otherwise the bonds would not be liquid everywhere.

JEWISH FARMERS' COÖPERATIVE CREDIT UNIONS. In 1911 the Jewish Agricultural and Industrial Aid Society began the formation of credit unions among Jewish farmers. Up to November, 1913, there had been formed seventeen such unions, with a total of 517 members. Eight unions were in New York, five in New Jersey, and four in Connecticut. The aid society is an offshoot of the Baron de Hirsch Foundation. The credit unions are formed by the sale of shares somewhat after the manner of the *Raiffeissen* banks of Germany. Additional capital is advanced by the aid society; that is, when a union gets together \$500 an additional \$1000 is advanced by the society at 2 per cent. interest. Loans are secured by real estate mortgages and are repayable by amortization in moderate annual installments. The rate of interest is 4 per cent. According to the 1913 report there had been made 1103 loans aggregating \$73,624; there had been repaid 754 loans, amounting to \$50,816; the total expenses had been only \$726. There are in addition a coöperative fire insurance company in Ulster and Sullivan counties, New York; and a coöperative farmers' purchasing bureau with headquarters at New York City. In one year the insurance company claimed a saving of \$35,000 to Jewish farmers.—*Financial Review*. See also **BANKS AND BANKING**.

AGRICULTURAL EDUCATION. Discussions concerning agricultural education during the year 1913 dealt primarily with what and how to teach in the elementary schools, secondary schools, and the colleges, rather than concerning the need of such education. In other words, the period of propaganda to convince educators and laymen of the desirability of agricultural education and research was nearly over. What was especially needed was wise and well-

educated leadership in order that the great movement under way might be efficiently organized and guided in right channels. While there was marked similarity in definitions of terms as adopted recently by the legislatures of Massachusetts, Indiana, and New Jersey, there was still wide difference in opinions as to the organizations, methods, and terminology of the subject, but the tendency was strongly toward uniformity.

IN FOREIGN COUNTRIES. There were many evidences of a continued and growing interest in agricultural education in foreign countries. The South African Union offered five government scholarships to sons of permanent residents of South Africa for study in agriculture abroad. The holders of the scholarships were to receive \$750 per annum for a period of from three to four years. The Haitian government made an appropriation for the establishment of an agricultural school, and negotiations were under way to engage professors from abroad to give instruction in the latest scientific agricultural methods.

The foundation stone of a new agricultural college, provided for in a bequest, was laid on an estate of over 200 acres near Newton Abbott, Devonshire, England. About \$500,000 was available for the institution, of which \$100,000 was to be utilized for buildings, and the remainder as a fund for administrative purposes. The institution was to provide agricultural instruction and also to become a research centre for the region. The government of Canada appropriated \$10,000,000 to cover a period of ten years, beginning with the year ending March 31, 1914, for instruction and research in agriculture. This fund was to be distributed among the provinces according to population. A law of August 21, 1912, reorganized the department and communal agricultural instruction in France. It established in each department a bureau of agricultural services, to replace the departmental professors of agriculture previously authorized. Under a law enacted by the Philippine legislature February 7, the director of agriculture was authorized to establish and maintain stations for practical agricultural instruction, and to organize and develop a system of cooperative agricultural instruction. A Spanish royal decree of April 11 provided for introducing instruction for the training of agricultural experts (*Peritos agricolas*) into the regional practical schools of agriculture at Valladolid and Zaragoza and the agricultural station at Albacete.

THE U. S. OFFICE OF EXPERIMENT STATIONS. This office continued to represent the U. S. Department of Agriculture in its relations with agricultural colleges and schools. Studies of agricultural schools with reference to the agricultural subjects which were being or should be taught therein and the requirements of such schools as regards the subject matter of agricultural instruction and facilities for such instruction were made. Publications were prepared for use in schools where agriculture is taught. These publications were chiefly based on the publications of the Department of Agriculture and the State experiment stations. Special sets of lantern slides with lecture outlines accompanying them were prepared, and the review of the world's literature of agri-

cultural education in the experiment station record was continued.

U. S. BUREAU OF EDUCATION. The division of rural education, organized in November, 1911, had specialists who were devoting their attention to the investigation of rural education, industrial education, school hygiene, and other problems, including salaries. Special attention had been given by the division, together with its fifty special affiliated collaborators, to the subject of agriculture in the public school.

GRADUATE SCHOOL OF AGRICULTURE. Announcement was made of the selection of Dr. A. C. True of the U. S. Office of Experiment Stations as dean of the sixth session of the Graduate School of Agriculture, to be held under the auspices of the American Association of Agricultural Colleges and Experiment Stations, at the Missouri Agricultural College, Columbia, Mo., July, 1914.

THE AGRICULTURAL COLLEGES. The increase in the number of students in the agricultural colleges was greater in 1912-13 than ever before, and was well distributed throughout the United States. A large part of this increase was due to the demand for teachers of agriculture and for county demonstration agents. Kansas State Agricultural College established a secondary school of agriculture in connection with the college, which was to be used as a model school in the teachers' training course. At the University of Vermont a department of extension was established. A department of agricultural education was also organized and was to offer a four-year teacher training course with secondary practice schools. Larger specific appropriations for extension work, both Federal and State, made it possible to employ additional men and women for the extension departments of the colleges and to inaugurate several new features of extension work, chief among which was the county farm adviser in which the U. S. Department of Agriculture, the State agricultural college, and other agencies cooperated.

Forty of the land-grant colleges offered during the past year special work for the preparation of teachers of agriculture; 15 offered courses covering four years for teachers; 2 offered two-year courses, and 3 gave one-year courses. Thirty-one of these institutions reported summer schools and 20 gave summer courses in agricultural pedagogy. Four institutions also offered a course for college graduates who expected to teach agriculture.

SECONDARY SCHOOLS. In Indiana a State supervisor of agricultural education has been appointed and departments of agriculture are to be established in a number of high schools in the State under the direction of the supervisor. This is in accordance with the conditions named in the vocational education bill passed by the 1913 legislature, which authorizes State aid to all departments and special schools conforming to the regulations of the State board of education.

According to the most reliable information obtainable, there were about 2300 high schools in the United States teaching agriculture in 1912-13, including 47 State agricultural schools 40 district agricultural schools, 67 county agricultural schools, 18 agricultural departments in high schools, and the remaining 2128 giving ordinary courses in agriculture. There were 103 normal schools offering courses in agricul-

ture. In New Jersey, by an act of the legislature of 1913, the State will give money for the equipment and maintenance of approved vocational schools, on a dollar-for-dollar basis, in proportion to the amount spent by the local community out of funds raised by local taxation to the amount of \$10,000 annually.

The chief obstacle in the way of the extension of agricultural teaching in the high schools of various States has been the expense connected with the undertaking. The State of Nebraska, recognizing this fact, passed in the session of the legislature of 1913 an act providing for the designation of accredited high schools as agricultural high schools eligible to receive a maximum of \$1250 each year from the State. State aided high schools must offer and teach agriculture, manual training, and home economics.

A law passed by the Tennessee General Assembly of 1913, authorizes the State board of education not only to give aid, to county high schools for general education purposes, but places at their disposal a sum of money for encouraging the organization of departments of industrial work, including agriculture, home economics, manual training, and related subjects, in such schools; and the State board of education has adopted a regulation that it will aid any such schools by appropriating as much as the county puts into such departments, up to \$1500.

BOYS' AND GIRLS' CLUBS. At the close of the cropping season of 1912, the office of farm management of the U. S. Department of Agriculture had a total enrollment of 22,000 boys and girls in clubs, covering the Northern, Central, and Western States, and at the close of the fiscal year ended June 30, 1913, the number had increased to 60,000.

In the boys' corn clubs of the Southern States 91,196 boys planted an acre of corn in 1913. The office of farmers' cooperative demonstration work in the Department of Agriculture, with whom these boys are enrolled, is now making a systematic campaign throughout the whole South, to show the corn-club boys the importance of legumes and winter cover crops. In the girls' canning clubs there are 33,060 members distributed over twelve Southern States. Each one of these girls has a garden of one-tenth of an acre of tomatoes.

Although the club activities in cooperation with the U. S. Department of Agriculture and the State colleges of agriculture are comparatively recent, the following club activities have been systematically organized and promoted during the past year: Boys' corn clubs on the acre basis, girls' canning and garden clubs based upon one-tenth of an acre of tomatoes and the canning of the surplus products, potato clubs, vacation canning and marketing clubs, sugar beet clubs, poultry clubs, vegetable garden clubs, and good-roads clubs.

During December 1905 boys and girls from Ohio, who had won prizes of distinction in their State by their ability to grow corn, made a two-day visit to Washington; and these were followed by large numbers from other States who had won distinction in their club work.

AGRICULTURAL EXPERIMENT STATIONS. **EXTENSION OF THE WORK.** The year 1913 marked the completion of a quarter century of operation of a national system of agricultural experiment stations under the Hatch

act of 1887. In this period there has been developed in the United States, "the most comprehensive and efficient system of experiment stations to be found in any country; one which has been close to the problems of the people, has revolutionized practice in many important respects and provided notable improvements in others, and has laid a broad foundation for a science of agriculture." There had been steady progress in the development of these institutions and by 1913 they were stronger than ever before in both personnel and equipment. Their investigations had become more thorough and dealt in large measure with the more fundamental problems. The requirements of such work were being more fully met by the provision of specially designed buildings, laboratory equipment, and apparatus. Examples of this were found in the special facilities for slaughtering animals and handling the carcasses preparatory to analysis in the new agricultural chemistry building at the Missouri station, in the extensive and elaborate facilities for milling grain and testing flour at the Kansas station, and a large outdoor library at the Colorado station for the study of hydraulics as related to irrigation.

The California station received large additions to its income from the State and made a programme for a large extension of experimental work in different parts of the State. The first State legislature of Arizona gave the station an appropriation of \$18,000. The Kentucky station had a large addition to its main building and a permanent State appropriation of \$50,000 per annum. Research in agricultural economics was organized on a broad scale at the Minnesota station. In Nebraska a fireproof building for agronomy, horticulture, botany, and entomology had been erected at a cost of \$85,000, and ampler provision was made for sub-stations. In New Jersey State appropriations aggregating \$150,000 were made for buildings and equipment, and 135 acres were added to the station farm. In Ohio the State appropriations for 1912-13 for the station work aggregated over \$200,000, and that station was using over 1500 acres in several counties in its field experiments. The North Carolina station established sub-stations on the black muck soils which cover an area of over 2,500,000 acres and are being reclaimed by drainage and in the region where bright tobacco is produced. The Texas station had more thoroughly organized the experimental work at the eleven sub-stations and made provision for greatly extending the feeding experiments at the main station.

FEDERAL AND STATE STATIONS. Agricultural experiment stations maintained in whole or in part by Federal funds in 1913 existed in every State and Territory, including Alaska, Hawaii, Porto Rico, and Guam. There were also stations in the Philippines under the insular government. In 1912 the stations employed 1583 persons in the work of administration and inquiry. The total income of the stations maintained under the acts of Congress of 1887 and 1906 was \$4,068,240, of which \$1,440,000 was received from the United States and about \$1,500,000 from State appropriations. The value of the additions to the station equipment aggregated \$1,506,127, of which \$1,003,516 was for buildings. In addition to this, the office of experiment stations had an appropriation of \$424,000, including \$30,000 each for Alaska,

Hawaii, and Porto Rico; \$15,000 for the Guam station; \$15,000 for nutrition investigations; \$100,000 for irrigation investigations; \$100,000 for drainage investigations; and \$10,000 for investigations of farmers' institutes and agricultural schools, together with \$8303 derived from the sale of agricultural products at the insular experiment stations.

In Alabama, Connecticut, Hawaii, Louisiana, Missouri, New Jersey, New York, North Carolina, and Virginia separate stations were maintained wholly or in part by State funds and numerous sub-stations were also maintained in a number of States. Excluding the sub-stations, the total number of stations in the United States is 65, of which 54 receive Federal funds. In 1912 the stations published 719 annual reports, bulletins and circulars, which were supplied to over 1,000,000 addresses on the regular mailing lists. The correspondence with farmers was enormous and constantly increasing.

OFFICE OF EXPERIMENT STATIONS. This office continued to maintain close relations with the experiment stations in the several States, conducted an inspection of their work and expenditures under the Hatch and Adams funds, and made the results of their work available to both popular and scientific readers. The advisory functions of the office increased materially with the growth of the extension enterprises in the colleges with which the stations are connected.

RECENT EXPERIMENTS. The Indiana station determined that the chemical composition of butter fat was largely controlled by feed, period of lactation, and breed, while the size of the fat globules was largely determined by breed, period of lactation, changes in feed, and other factors affecting the physical condition of the animal. In butter-making, the control of the moisture in butter was rapidly affected by the regulation of the churning temperature, adjustment of the amount of water present during the working process, and a systematic use of a reliable moisture test.

The Maine station reported that the essential feature of the inheritance in egg production is that the female fowl does not transmit the hereditary factor directly to her daughters but that she may transmit it to her sons, who may in turn stamp this quality on their female progeny. By reciprocal crossing of Barred Plymouth Rocks and Cornish Indian fowls, the station produced a new and highly desirable type of fowl which carries superior qualities as regards both egg and meat production. The histology of the oviduct of the hen was worked out and for the first time a detailed account of its microscopic anatomy was published. The facts set forth are essential to an understanding of the physiology of albumin, membrane, and shell-formation in the development of the egg.

The Arkansas station reported the discovery of motile organisms within the red-blood cells of cholera-infected hogs of the locality, and the study of these hematozoa to determine their significance and their possible relation to the disease was undertaken. Other results secured by this station indicated that the virus of hog cholera as it exists in the blood is prominently intracorporeal in habitat, but also occurs in the serum and plasma, and that in the shed blood it escapes from the corpuscles into the surrounding fluid either with or without cytolysis.

The production and distribution of hog cholera

serum is now conducted on a large scale by a number of stations with good results.

In rotation experiments at the Missouri station, in progress for 22 years, corn after corn yielded 12 bushels, a rotation of corn, oats, and clover 50 bushels, one of corn, oats, wheat, clover, and timothy two years 54 bushels, and the last-mentioned rotation with barnyard manure 74 bushels of corn per acre at the close of the 22-year period. By selective breeding the station increased the yielding capacity of one strain of wheat by about 8 bushels per acre.

The plant-breeding work of the Nebraska station resulted in the development of four superior strains of Turkey Red wheat, and it further showed that the pure strains vary not only in their ability to yield and in their resistance to lodging, but also in the shape and quality of the grain.

The insect and plant-disease control work of the Ohio station in the southeastern part of the State gave striking results in raising the productive capacity of orchards. In Washington County of the State, where formerly not enough apples were produced for home consumption, the income from this fruit amounted to \$65,000 in 1910, and to about \$200,000 in each of the years 1911 and 1912.

The investigations of poisonous plants conducted by the Wyoming station had the effect of reducing in a very striking manner the loss of sheep due to this source. At Medicine Bow, where the field experiments on woody aster were carried on for two years, the estimated annual loss was reduced from \$10,000 to practically nothing. In connection with this work an alkaloid contained in the death camas and named "zygadenine" was separated and crystallized in pure form.

In Alaska the work of hybridizing grains was continued at Rampart and four varieties of beardless barley were produced. A number of strains of alfalfa withstood three winters and some, especially the Grimm variety, made good growth. Attention was given to the seed habit of plants in order to select strains which would produce seed in Alaska. At the Fairbanks station, where farming on an extensive scale was being tried, spring wheat, winter rye, and oats grew well and matured large crops. On slightly more than five acres 1200 bushels of marketable potatoes were produced.

At the Hawaii station it was found possible to breed a strain of papayas, 92 per cent. of which were fruit-bearing, thus doing away with the fruitless staminate plants. Grafting papayas was not only very easy but of considerable value in propagating desirable strains. The soil survey of Hawaii was nearing completion. Many soils of unusual physical and chemical properties were found and their origin from lavas was traced. A series of experiments showed that the pineapple juice wasted in canning processes could be readily converted within 24 hours into a vinegar containing 3.5 per cent. to 4.5 per cent. of acetic acid. It was shown that kukui nuts had a value of at least 1½ cents a pound for oil and fertilizer. The development of the algaroba bean meal industry is proceeding rapidly.

In Guam experiments in breeding pure-bred horses, cattle, pigs, and chickens to the native stock were undertaken. A large number of tropical and subtropical fruits, vegetables and forage plants were tested.

In the Philippines a sugar-testing laboratory was established in the Bureau of Science, Manila, and a tobacco station at Iligan. Horse-breeding experiments were begun at Bagamanoc, Catanduanes Island.

In Canada an experiment farm was located near Fredericton, New Brunswick; an experiment station at Scott and a poultry station at Melfort, Saskatchewan; an experiment station at Sydney and an irrigation station for fruit at Invermere, British Columbia.

The following stations were recently established in other countries: A central station at Santa Beatriz, Peru; a cotton station at Caxias, a veterinary station at Bello Horizonte, a tobacco station at Parahiba, and a sugar-cane station at Buenos Aires, Argentina; a vegetable biology station at Poitiers, France; a plant-breeding institute at Eisgrub, Moravia; a general station at Alcalá de Henares and an olive station at Lucena, Spain; a tea station at Sambalpur, Bengal, and a paddy and sugar-cane station at Mangalallur, Madras Presidency, India; a sericultural station near Nakano, Tokyo, Japan. In the German African colonies stations were established at Kibongoto, Myombo, Tabora, Neu-damm, Okahandja, Jaunde, and Kamaa; in Belgian Congo at Elisabethville and Stabyleville; in Nyasaland at Zomba; in Rhodesia at Lochard; and in Sudan at Tayiba.

AGRICULTURAL LEGISLATION. LEGISLATION IN THE UNITED STATES. Agricultural measures received unusual consideration both from Congress and State legislatures in 1913. Special prominence was given to those designed to improve the farmer's economic status, as by regulating market practices, increasing facilities for agricultural credit and coöperation, and aiding him to drain, irrigate, and otherwise improve his farm. Many inspection laws were strengthened and extended, and several steps were taken to increase the dissemination of agricultural information. Agriculture was also affected by the new tariff act, which materially lowered the import duties on many farm products and removed them entirely from a large number of others, and by a clause in the sundry civil appropriation act, which prohibited the use of certain Federal funds for the prosecution of farmers organized to obtain fair prices for their products. Several States enacted laws relating to marketing, coöperation, and rural credit. (See AGRICULTURE.)

Long-term loans were authorized in Vermont from municipalities to farmers for drainage work. A constitutional amendment is to be submitted in Michigan permitting counties to issue bonds for drainage and other means of agricultural improvement. Kansas authorized its counties to purchase well-drilling machinery and established a State board of irrigation with authority to install pumping plants. Development districts were provided in Washington to assist especially in utilizing cut-over and other unimproved lands. Michigan exempted from taxation for four years cut-over and wild lands being brought into cultivation, and Washington exempted fruit trees other than nursery stock. In North Carolina, the State board of agriculture was authorized to quarry lime with convict labor and sell it to farmers at cost.

The police duties of the U. S. Department of Agriculture were further extended to the protection of migratory and insectivorous game birds (see ORNITHOLOGY) and the inspection of

viruses, serums, etc., for the treatment of animal diseases. Laws analogous to the Federal plant quarantine act of 1912 were passed in Missouri, Montana, and Oregon. Five other States strengthened their laws as to inspection of orchards and nursery stock, while 13 made more drastic provisions against animal diseases, and 3 against weed dissemination. New seed inspection laws were enacted in Michigan, Minnesota, Montana, North Dakota, Ohio, Oregon, Pennsylvania, South Dakota, Wisconsin, and Wyoming, and new stallion registration laws in Iowa, Kansas, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin. The laws as to feeding stuffs were amended in Kansas, Ohio, and Oregon; as to fertilizers in Iowa and Michigan, and as to insecticides and fungicides in California, North Dakota, and Ohio. Ohio also began the inspection of agricultural lime, and Michigan the testing of sugar beets at factories. Massachusetts towns and cities were authorized to appoint bird wardens. New codes of weights and measures on farm produce were formulated in Iowa, Minnesota, New York, and Ohio. Maine and Montana regulated the size of containers for apples, while Utah required labeling as to the owner and grade of the fruit.

The measures pending before the Sixty-second Congress for Federal aid to agricultural extension, vocational education, etc., all failed of enactment, but for the most part they were re-introduced into the Sixty-third Congress. The Lever bill, which carries an ultimate appropriation of about \$3,500,000 per annum to the States for the maintenance of agricultural extension work through their agricultural colleges, was modified somewhat by making this work coöperative with the U. S. Department of Agriculture. At the close of the year the measure was pending in this form before both the House and Senate, following favorable reports in December from their respective committees on agriculture. A resolution providing for the appointment of a commission to report on the need and form of Federal aid to vocational education was passed by the Senate in June and had been under discussion in the House on several occasions.

Meanwhile no fewer than nine States, namely, Michigan, Missouri, Montana, Nebraska, New Hampshire, North Dakota, Oregon, Pennsylvania, and Utah authorized their counties to employ farm experts for advisory and demonstration work. In most cases the direction of the work was entrusted to the State agricultural college in coöperation with the U. S. Department of Agriculture. New York provided for demonstration work at almshouses, and with Ohio extended further aid to county farm bureaus. Washington established a State bureau of farm development to assign experts to counties desiring them. In California, power to appoint experts was given to irrigation and drainage districts, while Illinois and Iowa authorized the formation of county associations to engage in similar work.

State departments of agriculture were organized in New Hampshire and Washington, a department of agriculture and publicity in Montana, an agricultural commission in Ohio, and a viticultural commission in California. Iowa encouraged the formation of dairy and beef cattle associations.

CANADIAN LEGISLATION. The Canadian government appropriated \$10,000,000 to cover a pe-

riod of ten years beginning March 31, 1913, for instruction and research in agriculture.

Nova Scotia provided for a system of district farm advisers, amended its stallion registration laws, and authorized farmers' cooperative fruit companies to deal in general agricultural commodities as well. The government may also contribute \$20 per mile for the construction of rural telephone lines.

A system of agricultural schools was authorized for New Brunswick. In British Columbia, the act of 1911 was amended to allow the government to make long-time loans to agricultural associations up to 80 per cent. of their subscribed capital.

EUROPEAN LEGISLATION. Great Britain made a minor amendment to its agricultural holdings act of 1908. France reorganized its ministry of agriculture, and its advisory superior council of agriculture, and established a phytopathological service and a commission on beautification of forests. It authorized the use of 12,000,000 francs for loans in agricultural credit, appropriated 10,000,000 francs for acquiring the forests of Eu, and amended its laws to encourage reforestation and the conservation of mountain lands.

Belgium established a phytopathological service, and Italy required the inspection of imported nursery stock, etc. Germany suspended for three years its tariff on imported beef, either fresh or frozen. Norway required imported seeds of common grasses and pines to be distinctively dyed, and fostered forestry and reforestation.

AFRICAN LEGISLATION. Rhodesia began state-aided purchase of pure-bred livestock for farms. The Union of South Africa and the East African Protectorate required the certification of imported potatoes as free from disease. Australia and Nyasaland adopted similar laws regarding nursery stock.

AGRICULTURAL TRAINING FOR FACTORY CHILDREN. See CHILD LABOR.

AGRICULTURE. (See also various countries, and States of the United States, under section so entitled.) The production of crops in the United States in 1913 was materially below the average, the combined yield per acre of corn, spring wheat, oats, barley, rye, buckwheat, hay, and potatoes being smaller than in any year in the past decade except 1911. This shortage was due to a severe drought accompanied by excessive heat during the summer months in an important portion of the agricultural district. The corn crop was less than two and a half billion bushels, the smallest crop since 1903, but the unusually large proportion of the heavy crop of 1912 carried over will mitigate somewhat the effects of the shortage. The winter wheat crop was unusually heavy, making the total wheat production (summer and winter) the largest ever recorded in this country, estimated at 763,000,000 bushels. The oat crop, while nearly 300,000,000 bushels shorter than the record crop of 1912, was the third largest of record, and estimated at 1,122,000,000 bushels. The hay crop was nearly 13 per cent. below the large crop of 1912, the yield per acre being considerably below the ten-year average. The production of cotton was estimated at 13,677,000 bales, or nearly equal to that of 1912, ranking third or fourth in size.

These five crops (corn, wheat, oats, hay, and cotton) comprised about 90 per cent. of the area in all crops, and hence had a predominating ef-

fect on the year's agricultural production. Nearly all the minor crops were materially smaller than in 1912 and the yield per acre below the average. The lessened crop production was, however, largely compensated for by higher prices, which gave to the 14 principal crops a total value of \$4,940,300,000, as compared with \$4,757,343,000 in 1912 and \$4,589,529,000 in 1911.

The distinctive features of the "world" crops were increased acreage of wheat, oats, barley, rye, and corn, as compared with 1912. The expectation at the close of the year was that the wheat crop would surpass all previous records and the oat crop rank among the largest ever grown. There was a short crop of rye in Russia, the chief rye producing country, but a large crop in Germany and some other countries was likely to counteract this shortage. Barley was only an average crop considered in a world sense, and the tremendous shortage of the world corn crop, consequent upon the decreased production in the United States, was coincident with a short crop in Russia.

IMPORTANT EVENTS. During the year Hon. James Wilson, Secretary of Agriculture in the United States for a period of 16 years, retired. The interval covered by his service was a most remarkable one in the development of American agriculture, in which he had a very important part. His administration was marked by an intimate knowledge of the practical needs of agriculture, confidence in the ability of science to make it not only more productive and profitable, but a more intelligent industry, and a constant effort to aid the farmer and to promote agricultural instruction. He was succeeded March 4 by Dr. David F. Houston.

In Great Britain, Sir Thomas Elliot, secretary of the board of agriculture and fisheries since 1892, was promoted at the close of 1912 to be deputy master of the mint. He was succeeded by Sir Sydney Olivier, governor of Jamaica. In France, Ferdinand David succeeded Jules Pams as minister of agriculture.

A new law in Ohio established an agricultural commission of four men to take over the duties of the State board of agriculture, the State dairy and food commission, the governing board of the experiment station, and in large measure the State pharmacy board. New Hampshire established a department of agriculture in place of the former board of agriculture; Montana a department of agriculture and publicity; and California a viticultural commission. A State department of agriculture was established in Washington, with a commissioner who will take over the duties now divided among a large number of officials, including the inspection of fertilizers and feeding stuffs and the stallion registration.

A central chamber of agriculture was opened at St. Petersburg at the close of 1912, to promote the agricultural interests throughout Russia. One of its first duties will be the working out of measures for improving the quality of Russian products exported to foreign countries. The Zemstvos and agricultural societies will continue to serve the purely local agricultural interests.

A larger Homestead act was passed by the United States Congress in the spring of 1913, enabling settlers on dry lands to acquire 320 acres of land. A plan for homesteading public lands in the Philippines was adopted. Under a recent law 400,000 pesos were appropriated for the establishment and maintenance of colonies and

1912

plantations on the public lands for the cultivation of rice and other cereals. Laborers may be located on homesteads suitable for the purpose, title to the land to be given in five years from date of filing the application.

A southern settlement and development organization has been formed with a view to unifying the work of the States, railroad and transportation companies, and other agencies in the development of the 16 States of the South. The State of Maryland appropriated \$30,000 for the work of the organization, and it was hoped to enlist the financial aid of other Southern States. It is no part of the purpose of the organization to make money for itself or its members, but rather to promote the settlement and development of the South. Agriculture will naturally form a large feature of the work. Dr. C. G. Hopkins, of the Illinois Experiment Station, temporarily was in charge of the agricultural development features, and was to give attention to the improvement and restoration of soil fertility.

The Canadian government appropriated \$10,000,000 for agriculture, to be paid in annual allotments of \$1,000,000 for 10 years, beginning with the year ending March 31, 1914. The livestock, dairy, fruit, and other interests were to be aided through the federal department of agriculture by investigation, improvement in transportation, development of markets, etc. Agricultural education was to be assisted through increasing the equipment and facilities of the agricultural colleges, establishing schools and short courses, introduction of agricultural teaching in the public schools, and agricultural extension work.

The British board of agriculture, which was granted the sum of \$150,000 annually from the development fund for aiding research in various branches of agriculture, completed its arrangements with a series of existing institutions to conduct researches on special subjects, and allotted funds for the purpose. The board also completed its scheme for the allotment of an annual grant of \$60,000 from the same source for furnishing technical advice to farmers and the investigation of local agricultural problems. Additions were made to the staff of eight institutions to carry out this advisory and local experimental work. A grant of \$180,000 was made from the development fund to aid in the improvement of livestock in England and Wales. This was to take the form of provision of high-class bulls, stallions, and boars, and financial assistance to cow-testing associations.

The Austrian ministry of agriculture was charged with the administration of a fund which provided about \$1,250,000 annually for the development of animal breeding in Austria for the years 1910 to 1918. A recent report showed that about a million dollars was used for providing first-class breeding stock, subventions to cattle breeding centres, establishment of herdbooks, and premiums to stockmen. The scheme includes the improvement of pastures, the encouragement of the growth of fodder crops, provision of dairy experts, the promotion of livestock insurance, the sale of livestock, and other measures.

William Deering, one of the founders of the International Harvester Company and long the head of the Deering Harvester Company, died at Chicago in November. His self-binder reduced hand labor of harvesting enormously and

placed his name beside that of McCormick, the inventor of the reaper.

FOREIGN STATISTICS AND DEVELOPMENT. Recent statistics for Australian agriculture show that in the 50 years from 1861 to 1911 the area under cultivation increased from 1,188,282 acres to 11,893,833 acres, and that for the past 10 years the increase has been considerably more rapid than the population. About 62 per cent. of the cultivated area in 1911 was in wheat and 19 per cent. in hay, the remainder being in crops of lesser importance. The ministry of agriculture in Argentina had begun the introduction of camels in the expectation that they would prove useful for all kinds of farm work in parts of the country not adapted to oxen or horses. The same government was making an effort to improve the breed of pigs in that country, and its special representatives visited the United States looking up breeding stock. It was proposed to purchase 10,000 pigs for breeding purposes.

The government of South Africa during the year adopted a plan to encourage immigrant farmers and laborers, by grants of assisted passage. These grants cover the free transportation by sea and land of the immigrant and his family and reasonable baggage, one-half being paid by the government and the balance by the resident farmer desiring to secure immigrant labor. The contract covers a period of three years, at a wage rate approved by the government. Immigrants desiring to engage in farming on the expiration of their contracts will be assisted to settle on the land. The South African government has also concluded a contract with a steamship company providing for free shipment of pedigreed livestock for breeding purposes. Stock imported under these conditions may not be removed from the country within a period of three years. The concession was being freely taken advantage of by the farmers, the shipments of stock having largely increased.

Great strides were reported in agriculture in the Transvaal, Orange Free State, and other parts of South Africa. The large farms in the Transvaal were being cut up, which means closer settlement and more intensive cultivation. Corn culture (maize) was developing more rapidly than that of any other crop, the climate conditions proving admirably adapted to it. There was a large market for the grain.

European agricultural colonization was in full progress in Madagascar, where 252,790 acres were under cultivation by settlers in 1912, as compared with 105,270 acres in 1911. Important plantations of vanilla, coffee, cacao, coconut, and ylang-ylang have been made in the past few years. In 1912 the natives had 1,930,000 acres under cultivation, chiefly rice, clove trees, coconut, coffee, cotton, and vanilla.

According to a recent report of the Italian ministry of agriculture 92.6 per cent. of the total area of 70,820,197 acres of land is productive, and only 7.4 per cent. is unproductive.

The scarcity of meat in Germany has caused the government to encourage cattle-raising, the land necessary being obtained by making the waste lands and peat moors available as meadows and pastures through drainage. The cutting of peat is discouraged. The Prussian Diet has had under consideration the making of a large appropriation for the reclamation of these lands, and the provisional government and agricultural societies are giving attention to the matter.

AGRICULTURAL CONDITIONS IN GREAT BRITAIN. A report on agricultural conditions in Great Britain and Ireland was made to the governor of Iowa by ex-Secretary of Agriculture James Wilson and Mr. Henry Wallace, on the basis of an official visit to these countries during the year. The report comments on the high character of farming, the thoroughness of cultivation, the entire absence of what is known in the United States as worn-out land, and the superior type of livestock kept. It deals largely with the tenant system and laws relating to it. This system prevails almost exclusively in Scotland, but the one-year lease common in the United States is absent, the leases running from 14 to 19 years. This length of lease, with the mutual interest in the land of both the landlord and tenant under the law, tends to preserve its fertility and productive power. The price of land was found as low as in Iowa for similar quality, when it could be bought at all, and the income of the landlords was as low or lower than in that State. In England, Ireland, and Scotland an interesting feature was reported to be the reduction in the area of cultivated crops, owing to the scarcity and high prices of farm help. More land was being put into grass for hay and grazing.

Official statistics show that in England and Wales the reduction in the number of large farms (over 300 acres) continues, 628 of these having disappeared since 1905. In the same time the number of holdings of from five to 300 acres has increased over 3000. This is the more significant since during that period the farmed area (under crops and grass) has diminished by 231,000 acres. The large farms continue to occupy a very considerable proportion of the land—about 25 per cent. in farms exceeding 300 acres, and nearly 60 per cent. in medium farms of 50 to 300 acres, the small holdings of 50 acres or under representing only about 15 per cent. of the agricultural land.

Under the small holdings act the county councils in England and Wales had up to the close of 1912 acquired 154,977 acres, of which 124,700 acres had been let to 8950 individual small holders and a small amount sold. In addition, over 6000 acres had been let to coöperative small-holdings associations which had sublet it to nearly a thousand of their members; and nearly 3000 applicants had been provided with over 37,000 acres by private land owners direct, mainly through the instrumentality of the councils. In five years the small holdings act had resulted in providing land for approximately 15,176 applicants, and in the opinion of the board of agriculture "has proved of signal benefit to the rural population."

A vigorous campaign was opened by David Lloyd-George, Chancellor of the Exchequer, against landlordism in Great Britain. He stated that "the foremost task of liberalism in the near future is the regeneration of rural life—the emancipation of the land of this country from the paralyzing grip of a rusty, effete, and unprofitable system." There were three land-reform programmes: One by the Tories, in which purchase from the landlords was the chief feature; another advocated by the Liberals which did not include purchase, but would break up game preserves, encourage tenant farming by state aid, promote agricultural efficiency and coöperation for marketing pur-

poses, improve housing conditions, and increase the wages of agricultural labor; and a still more radical policy by the Labor party, which included purchase, but on terms and conditions very different from those of the Tory leaders.

RURAL DEPOPULATION. The real problem which rural depopulation is becoming, especially in Europe, was emphasized by its selection as the principal topic for extended discussion at the Tenth International Congress of Agriculture at Ghent last summer. The presiding officer at the opening sessions, the president of the International Commission of Agriculture and formerly prime minister of France, took it as the theme of his address. Pointing to the diminishing world's production of wheat and of meat in proportion to population, he urged the necessity of bringing back to the soil the capital and labor that have long been drifting to the towns and cities. He held that wages and conditions must be made more attractive for laborers in the country, inducements must be offered to them to become small land owners, and finally the attitude toward agriculture as a calling should be improved.

Rural depopulation in France and the increasing dependence on foreign labor for harvesting crops was occupying the attention of the government. According to statistics gathered by the ministry of agriculture there were 2,320,000 persons employed in agricultural pursuits in all France, as compared with a little over 3 millions in 1892, 3½ millions in 1882, and 4 millions in 1862. In half a century the agricultural labor had diminished 40 per cent. This was due to the peasants and country people forsaking their farms and flocking to the cities. The reason was ascribed to small returns, irregular work, long periods of enforced idleness, and crop failures due to hail, blight, mildew, etc. In the wine-growing districts a continued decrease of small land owners was reported.

England has experienced a shortage of farm labor, and higher prices have had to be paid at recent hirings. Large numbers of laborers are emigrating, and there is much agitation for a fixed working week, with pay for overtime, a fixed minimum wage, and other concessions.

FARM LAND VALUES IN UNITED STATES. The census of 1910 showed that from 1900 to 1910 the value of farm lands in the United States increased from \$13,058,000,000 to \$28,476,000,000, or 118 per cent. This was largely accounted for by the increased value per acre of 108 per cent., showing that the total advance in valuation was but slightly attributable to increased acreage. There is no record of an equally large rise at any period in the history of this country. While the increased value per acre was general the country over, the largest gain was in the West. In the Middle Atlantic and North Atlantic States the increase ran up to 100 per cent., while for the groups of States west of the Mississippi it ranged from 146 to 222 per cent., nine Western States showing an increased value per acre of from 200 to 300 per cent. and one State of 476 per cent. This represents the formerly cheap land from which the staple farm products are so largely derived.

RURAL ORGANIZATION AND COÖPERATION. This subject commanded widespread attention in the United States during 1913, as in previous years. Two events of special significance oc-

curred during 1913—the establishment of a rural organization service in the United States Department of Agriculture, and the sending of two commissions to Europe to study the methods and operation of coöperative organizations and rural credit institutions as worked out there. The new Secretary of Agriculture recognized that there were other phases of agriculture at present quite as important as increasing production, and that in the United States “we are face to face with the whole problem of the organization of rural life.” One of his first acts therefore was to establish the rural organization service, with Dr. Thomas N. Carver, professor of economics in Harvard University, at its head. As preliminary work, a careful field study was being made to find out what forms of organization have been tried, under what conditions they have succeeded and the reasons for failure, and how more of the successful enterprises may be started. It was hoped to stimulate and coördinate these organizations and thus to set in motion a great movement toward organization and coöperation. An office of markets and divisions of producers’ and purchasers’ associations and of rural finance were provided.

The general subject was commanding the attention of State legislative bodies. In New York an assistant State commissioner of agriculture was appointed to assist in organizing and maintaining agricultural coöperative enterprises; and Indiana, Michigan, and Washington passed general legislation relating to coöperative associations. Many of the States sent delegates abroad to coöperate with the Federal Commission on Agricultural Coöperation and Credits. In Nebraska a federation known as the Agricultural Council of Nebraska was organized, composed of representatives from each of the agricultural organizations in the State, the object being to secure united action in matters of mutual interest. In the Northwest an organization called the Right Relationship League was promoting and supervising coöperative stores, of which the members are largely farmers.

In Canada the deputy minister of agriculture appointed a special commissioner to inquire into the question of federal and provincial coöperation in the encouragement of agriculture. A coöperative movement for the sale of poultry products in Great Britain was inaugurated with the opening of a central depot in London by the national poultry organization society, which had branches scattered all over Great Britain and Ireland. A coöperative bacon factory, said to be the first of its kind in England, was established to serve the counties of Hereford and Bedford. The coöperative movement in Russia continued to grow in spite of the poor crops of recent years. Dairy coöperative organizations, chiefly for the direct sale of milk and dairy products, continued to develop. During the year 1913 the coöperative movement was showing a greater tendency toward centralization, which has proved beneficial. A farmers’ coöperative organization society, with an initial capital of \$1,500,000, had been decided upon in New Zealand. The purchase of supplies and sale of produce were objects of the society.

Acting on authority of Congress, President Wilson in the spring appointed a Federal commission of seven persons on rural credits and coöperation, which went abroad the last of

April and returned the end of July. It was accompanied by an American commission, composed of State delegates from practically every section of the Union, and numbering more than a hundred persons. This joint commission visited the principal agricultural countries of Europe, either in a body or through subcommissions. It collected a vast amount of documentary evidence and other data, which was arranged and digested by a committee, and was transmitted to the United States Senate and printed in a volume of some thousand pages (Senate Doc. 214). A summary of the findings was also issued (Senate Doc. 261). The report of the joint commission, with recommendations for legislation on rural credit, was submitted to the President in December, but had not been made public at the close of the year.

RURAL FINANCE. It is stated on authority that no country in the civilized world is so nearly without satisfactory and adequate rural credit facilities as the United States at the present time. This handicap forces young, would-be farmers into wage-earning occupations, and it prevents those who do undertake farming from putting into it the capital needed to get the best results. Data collected by the Department of Agriculture early in 1913 showed the predominating rate of interest in the New England and Central States to be 6 per cent. for short-time loans and 5 per cent. for secured loans. In the South and Southwest the rate increased to from 8 to 12 per cent., while in the Western States it was from 7½ to 12 per cent. The average rate in Oklahoma, 11.58 per cent., was higher than from any other State, the range being from 8 to 20 per cent. Statistics in relation to farm mortgages, collected by the United States Census Bureau, show that in the United States as a whole the number of farm mortgages has increased the last two decades more rapidly than the number of farmers free from mortgage, the proportion mortgaged being 28.2 per cent. in 1890, 31.1 in 1900, and 33.6 in 1910. The proportion of mortgaged farms in the last decade increased in every geographical division except the Middle Atlantic, the most conspicuous increase being in the three Southern divisions. This is attributed to increased confidence of lenders in the title to land and the ability of farmers to pay. For the something over a million farms for which statistics were gathered the mortgage indebtedness averaged 27.3 per cent. of their value. Although the average amount of indebtedness per farm showed an increase, it is noteworthy that the average owner’s equity per farm more than doubled.

The subject of rural credit presents two aspects, the need for long-time loans for permanent investments and for productive improvements, and the improvement of conditions under which short-time loans may be made for carrying current expenses, as in other business, and especially in the case of the farmer who is just getting established. The rapid increase in farm values and the difficulty of securing free homesteads have given impetus to the growth of the renting system. It is this tendency especially that suggests the importance of devising farm loans on terms that will enable the producers to make the necessary payments on the interest and principal from the returns of the land itself.

Various measures for providing better bor-

rowing facilities were before Congress, and some relief was expected from the new currency law. This law permits national banks to make five-year loans on farm lands up to 50 per cent. of their value, and loans for six months on crops and livestock. In Louisiana, a constitutional amendment went into effect exempting from taxation for 20 years trust companies formed for the sole purpose of lending money on farm lands. Massachusetts, New York, and Texas authorized the formation of agricultural cooperative banks.

The agricultural bank founded in the Philippines by the government about four years ago, for the relief of Filipino farmers from oppressive interest rates, had passed the experimental stage and was proving a great success.

In the fiscal year 1913 the bank had loans on agricultural property of \$880,126 (gold), nearly double the amount of the preceding year. The bank had 24 branches or agencies, 13 of which were established during the past year. It had more calls for money than it could meet.

An amendment to the agricultural associations act of British Columbia, passed during the year, provided for making governmental loans to associations engaged in maintaining and operating various agricultural industries, at the rate of four per cent. The Canadian Pacific Railway in settling up its land grant was serving in a sense as an agricultural bank for its settlers, so that these settlers in a new and undeveloped country are said to have better credit facilities than thousands of good farmers in the older farming districts.

In Italy a national cooperative credit institute was established on the initiative of the minister of agriculture, to furnish financial aid to legally organized cooperative bodies and to smaller agricultural associations and peasant farmers. The capital of the institute was \$1,500,000, supplied by the various savings banks of the country, and is expected to be increased to \$2,000,000. Recent statistics showed that more than \$90,000,000 had been loaned by the New Zealand and Australian governments to their farmers.

MARKETING AND DISTRIBUTION. Unusual interest was manifested in this subject, not only by farmers and producers, but by consumers in towns, who recognized the effect of the present machinery of distribution on the cost of food.

Congress had authorized the Department of Agriculture to investigate the present systems of marketing and distributing farm products, on the basis of which an office of markets has been organized. This office was to seek to locate the demand for and the supply of farm products, promulgate market grades and standards for products, and otherwise to promote the delivery of farm produce by the producer to the consumer with a minimum of waste and expense. A bulletin was issued by the department (Report No. 98) early in the year on "Systems of Marketing Farm Products and Demand for Such Products at Trade Centres."

Investigations by the department of the methods of grading and shipping several staple crops point to unnecessary waste and expense. In the case of corn, for example, it was found that owing to shipment before it is sufficiently dried out, freight is paid on 436,682 tons of excessive moisture annually, which not only adds to the net cost of the corn after it is de-

livered, but results in the farmer's product being placed in the third or lower grade instead of in the second. Furthermore it is one explanation of the shortage of freight cars in the corn-shipping season, the excess moisture being equivalent to over 14,500 freight car loads.

Much data has been collected and published on the cost of distributing food products from the farm to the consumer. Such a study was made, in Philadelphia in 1912, and reported to the mayor, of farm products shipped into the city from outlying counties. High grade butter, which the farmer sold for 23 cents the jobber received 26 cents for, the wholesaler 29 cents, and the retailer 40 to 45 cents a pound, an increase of 74 to 96 per cent. Potatoes, which brought 63 cents at the farm retailed at \$1.30 to \$1.60, a percentage increase of 106 to 154. Eggs increased from the producer to the retail price 106 to 173 per cent., berries 114 to 200 per cent., live poultry (low grade) 266 per cent., sweet corn 167 per cent., and fresh tomatoes 150 per cent. The average advance paid by the consumer was 136 per cent.

Another study, by the United States Department of Agriculture, of marketing vegetable products showed that under the present system only 33 to 36 per cent. of the price which the consumer pays for perishable products reaches the producer. About 26 per cent. of the cost to the consumer represents transportation charges, from 5 to 10 per cent. commission, while dealers' profits range from 50 to 100 per cent. each; and it is noted that some of the perishable products carry as many as eight distinct charges before reaching the consumer.

To eliminate these, cooperative marketing is the generally advocated remedy, the pack or package being standardized and the grade guaranteed. The trolley lines which run from the country into the large cities were suggested as affording a means of more direct distribution, the produce to be hauled in at night and delivered to stations in the residence districts, where the people would leave orders. Many farmers and truck growers were already availing themselves of the parcel post as a means of supplying customers in the city with chickens, fresh eggs, butter, and vegetables, at a cheaper rate and in fresher condition. The increase in the weight limit to the second zone to 50 pounds greatly enlarged this opportunity.

Naturally the commission men and the methods of some of them have come in for some criticism in studying the prevailing systems of marketing produce in cities. Numerous instances have been traced in which unscrupulous commission merchants have made returns to the farmer considerably below what the products sold for. The practice became so frequent and distrust so widespread that a law was passed in New York State during the year requiring the licensing and bonding of all commission merchants handling farm produce. Under this law nearly 700 commission merchants registered and gave bond in the sum of \$3000, on which they may be held in case of proven fraud. Similar laws were enacted in Michigan and Oregon, while Missouri amended its law to require a more stringent accounting by commission merchants. In Texas \$15,000 was appropriated to gather information on marketing methods.

FARM MANAGEMENT. Within the past few years a new division of agricultural economics

has been developed which treats of the business side of farming, especially as related to farm organization. This includes the selecting of suitable lines as the basis of the farm business and fitting them together into a practical and economical system of management. Ordinarily this means a system that will permit the maximum use of power, labor, and capital within the limits of the owner's available resources, that will require a minimum of equipment with the maximum use of that equipment, and that will so distribute the labor during the season that both man and beast will be profitably occupied at all times without being too much crowded at any one time. It therefore implies diversity of farming and careful planning and adjustment of the cropping system. To devise efficient systems of farm management requires taking account of an unusual number of factors and the procuring of a great variety of information regarding practical operations. It has therefore opened up a somewhat new field of systematic inquiry and correlation of facts, and given a new point of view.

Farm management work in the United States started in the Department of Agriculture and has now spread to many of the agricultural institutions over the country. Numerous studies have been made of systems of farming as followed in various sections, counties or townships, the capital invested, the labor and other expenses of operation, the amount and value of the products, and the net returns to the farmer and his family. Such studies have naturally led into farm accounting, which is largely neglected by most farmers, and estimation of the cost of production. They have made surprising disclosures as to the small returns under some systems and in some sections, and brought to light many examples of exceptionally good planning and successful management. The office of farm management in the Department of Agriculture has secured survey records of over 2000 farms, which give a complete analysis of the farmers' business and show the relative efficiency of labor under different farm conditions. Such systematic studies have brought a more intimate knowledge of the detailed practices, and of the limiting factors governing these practices and affecting their profitability. They have enabled plans and specifications to be drawn up for the organization and administration of farms to meet increasing demands in that line.

A considerable literature has grown up on this subject, mainly bulletins of the Department of Agriculture and the experiment stations. A pamphlet entitled *What is Farm Management?* by W. J. Spillman, issued by the Department of Agriculture (Bureau of Plant Industry Bulletin 259) near the close of 1912, explains the scope and method of this subject. A treatise entitled *Farm Management*, by Dr. G. F. Warren, of Cornell University (New York, 1913), is the latest important addition to the literature. A thriving organization, known as the American Farm Management Association, held its third annual meeting in Washington during the year, dealing especially with the teaching of farm management, cost accounting, agricultural surveys, and farm efficiency.

CONGRESSES AND EXHIBITIONS. The Tenth International Congress of Agriculture, held at Ghent, Belgium, June 8 to 13, included representatives from 25 countries. The topic for the

general sessions was "Rural Depopulation," and there were sections on rural economics, agricultural science and education, animal industry, rural engineering, and forestry. The former committee of arrangements for these congresses was converted into a permanent international commission of about 100 members, with headquarters in Paris. A proposition to organize an interparliamentary union of agricultural representatives was considered, with a view to dignifying the legislative status of agriculture and assisting to obtain action on measures of importance. The American delegate, Dr. A. C. True, extended an invitation to the congress to hold its next session in San Francisco in 1915, which is under consideration. Following the above congress, the Third International Congress of Agricultural Women and the Second International Congress of Instruction in Domestic Science were held.

The fourth session of the General Assembly of the International Institute of Agriculture, held at Rome, May 6 to 12, directed attention anew to the substantial progress being made in this unique enterprise, which assumed tangible form eight years ago as a world's clearinghouse of agricultural information. Representatives were present from most of the 53 contributing countries. Several series of periodical publications have been established by the institute for the dissemination of information on crop and other agricultural statistics, economic questions, and progress in agricultural science and practice, most of which are now issued in English as well as French, the official language of the institute. New annuals recently inaugurated are the *Annuaire*, the *Legislation Agricole* and the *International Yearbook of Agricultural Statistics*.

The Fifth National Corn Exposition, held at Columbia, S. C., early in the year, contained exhibits from some 25 agricultural colleges and experiment stations, as well as from the States and individuals, and probably the largest exclusively agricultural exhibit the Federal Department of Agriculture has ever sent out.

The International Dry Farming Congress was held in Tulsa, Okla., early in November. The 1914 congress was to be held at Wichita, Kan. The National Dairy Show at Chicago, in November, was more largely attended than in any previous year, some 150,000 persons being present. A dairy council was formed which banded together practically every phase of the dairy industry. Prof. H. E. Van Norman, dean of the agricultural school at Davis, Cal., was elected president. The International Livestock Exposition at Chicago early in December surpassed all previous exhibitions in the number of entries, in the general high grade of the exhibits and in attendance.

The twenty-sixth annual exposition of the German Agricultural Society was held at Strassburg June 5 to 10. It was one of the most successful expositions of the society, which have been held annually since 1884 except in 1912, when it had to be abandoned owing to the prevalence of foot-and-mouth disease. The showing of livestock was large. The National Livestock and Agricultural Exposition held at Montevideo, Uruguay, during August was the most important and successful national fair ever held in the republic. The livestock exhibits were good, and the exhibitions of agricultural

machinery, practically all American, proved of the greatest interest.

The prominence which agricultural gatherings have assumed in the United States was indicated by the presence of Governor Cox at a field meeting of some 5000 people in Wooster, O., to celebrate the twenty-fifth anniversary of Prof. C. E. Thorne's directorship of the State experiment station, and the attendance of the governors of Delaware and Maryland at a meeting of some 6000 people to look over the work of the Delaware College and Experiment Station. These meetings were in no sense political, but were used by the chief executives of the States to discuss with the farmers matters which closely concerned them and their industry, as well as the welfare of the States.

A three-days' convention of the National Forward to the Land League was held in Boston, Mass., in August. The New England Conference on Rural Progress held its seventh annual conference in Boston in March, with delegates present from the various New England organizations. This conference was an expression of the fact now realized that New England constitutes an economic unit, and this has led to considerable unity of action along agricultural lines. The Massachusetts Federation for Rural Progress was formed October 21, representing various agricultural organizations, chambers of commerce, etc. There will be commissions dealing respectively with farm improvement, marketing and exchange, and community life. The Collegiate Country Life Club of America has been formed with the idea of developing a national organization of college men for agricultural betterment. It is intended to organize chapters in the various agricultural colleges and wherever there are clubs of college men interested in the subject.

In June, 1914, there were to be held in London, (1) the First International Exhibition of Cotton, Fibres, and Tropical Products; (2) the Third International Congress of Tropical Agriculture and Colonial Development; and (3) the Fourth International Rubber and Allied Industries Exhibition. The Sixth International Congress of the Dairy Industry will convene at Bern, Switzerland, June 8 to 10, 1914. There will be sections on hygiene, chemistry and bacteriology, dairy management, and trade. See also FERTILIZERS, HORTICULTURE, STOCK-RAISING, and SOIL.

LITERATURE. The following are some of the noteworthy books recently issued: Alva Agee, *Crops and Methods of Soil Improvement* (New York, 1912); G. F. Warren, *Farm Management* (New York, 1913); W. B. Mercier and H. E. Savely, *The Knapp Method of Growing Cotton* (New York, 1913); F. I. Anderson, *The Farmer of To-morrow* (New York, 1913); A. D. Hall, *A Pilgrimage of British Farming* (London, 1913); R. N. Lyne, *Mozambique; Its Agricultural Development* (London, 1913); R. E. Prothero, *English Farming, Past and Present* (London, New York, Bombay, and Calcutta, 1912); *Die Deutsche Landwirtschaft unter Kaiser Wilhelm II.* (Halle-a.-S., 1913, 2 vols.); D. Zolla, *L'Agriculture Moderne* (Paris, 1913); W. H. Olin, *American Irrigation Farming* (Chicago, 1913); J. B. Davidson, *Agricultural Engineering* (St. Paul, Minn., 1913); G. H. Powell, *Co-operation in Agriculture* (New York, 1913); E. A. Pratt, *Agricultural Organization* (London,

1912); and J. M. Gillette, *Constructive Rural Sociology* (New York, 1913).

A new journal of plant breeding, *Zeitschrift für Pflanzenzuchten*, has been established in Berlin under the editorship of Dr. C. Fruwirth. The *Journal of Agricultural Research*, a technical monthly dealing with the research work of the U. S. Department of Agriculture, began publication in October.

AGRICULTURE, UNITED STATES DEPARTMENT OF. See UNITED STATES DEPARTMENT OF AGRICULTURE.

AIRSHIPS. See AERONAUTICS.

AKRON, UNIVERSITY OF. In April, 1913, the trustees of Buchtel College offered its entire plant and endowment to the city of Akron as the nucleus of a municipal university. With the acceptance of the offer, the new University of Akron came into existence on January 1, 1914. The name of Buchtel College will be retained for the College of Liberal Arts. The new university is co-educational. The value of the college buildings and grounds turned over to the university of Buchtel College was estimated in 1913 to be \$300,000. There were 19 faculty members and 200 students. The library contains 10,000 volumes. The president is Parker R. Kolbe.

ALABAMA. POPULATION. The population of the State in 1910 was 2,138,093; according to the report of the Bureau of the Census made in 1913, it was then 2,238,614.

AGRICULTURE. The area, production, and value of the principal crops in 1912-1913 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	3,200,000	55,360,000	\$49,270,000
	1912	3,150,000	54,180,000	42,120,000
Wheat	1913	32,000	374,000	430,000
	1912	30,000	318,000	359,000
Oats	1913	325,000	6,662,000	4,597,000
	1912	260,000	5,200,000	3,224,000
Rye	1913	1,000	11,000	15,000
	1912	1,000	12,000	16,000
Rice	1913	200,000	4,000	2,000
	1912	300,000	9,000	8,000
Potatoes	1913	18,000	1,512,000	1,588,000
	1912	15,000	1,215,000	1,094,000
Hay	1913	210,000	a 286,000	4,061,000
	1912	209,000	261,000	3,811,000
Tobacco	1913	300	b 210,000	52,000
	1912	300	225,000	79,000
Cotton	1913	3,800,000	c 1,510,000	91,704,000
	1912	3,730,000	1,342,000	77,681,000

a Tons. b Pounds. c Bales of 500 pounds gross weight.

MINERAL PRODUCTION. The total mineral production of the State in 1912 was valued at \$30,641,983, compared with \$28,005,785 in 1911. The production of coal in Alabama in 1912 was 16,100,600 short tons, valued at \$20,829,252. This was an increase of 1,079,179 tons over the production of 1911, which amounted to 15,021,421 tons, with the value of \$19,079,941. The evolution in making coke in the United States and the gradual shifting of this related industry from the coal-mining regions to the centres of population and manufacture is shown in the statistics of coal production of Alabama. According to the returns, the quantity of coal made into coke decreased from 4,417,443 tons in 1910 to 3,129,332 tons in 1911, and to 1,916,474 tons in 1912, whereas the actual quantities of coal made into coke in the State were 5,272,322

tons in 1910, 4,414,298 in 1911, and 4,585,498 in 1912. The reason for this apparent discrepancy lies in the fact that in the two latter years the proportion of coal made into coke in by-products ovens materially increased, and as these ovens were located at the blast furnaces or in or near the largest cities, the coal shipped to them appears as a part of the product "loaded at the mines for shipment," and not as coal made into coke at the mines. The quantity of Alabama coal made into coke in 1912 at points distant from the mines was nearly one and one-half times that used in the ovens near the mines. The production of coal in 1913 is estimated by the United States Geological Survey of from 3 to 5 per cent. greater than in 1912. Several new mines were opened in the State in the spring, and furnished a greatly increased output during the year. Coal mining in Alabama in 1912 gave employment to 22,613 men for an average of 245 days, compared with 22,707 men or 227 days in 1911. The average production per man in 1912 was 712 tons, compared with 662 in 1911. Most of the mines in Alabama are operated ten hours a day. The production by machines increased from 2,936,512 tons in 1911 to 3,742,547 tons in 1912.

Alabama ranks third among the States in the production of iron ore. There were produced in 1912 4,776,545 long tons, valued at \$5,734,371, compared with 3,955,582 tons, valued at \$4,876,106. The production of pig iron, in which the State ranks fifth, was, in 1912, 1,862,681 long tons, compared with 1,712,211 long tons in 1911. There were 19 furnaces in blast in the State on June 30, 1912. The total value of all clay products in Alabama in 1912 was \$1,935,179, a decrease of \$11,923 from the product of 1911. The principal product is common brick. This item in 1912 was valued at \$759,409.

According to the United States Bureau of Mines, there were 121 fatal accidents in the coal mines of Alabama in 1912, a decided improvement over 1911, when because of several explosions and frequent deaths from windy shots, the aggregate number of fatalities was 209. Of the 121 deaths in 1912, 110 occurred underground, 61 were due to falls of roof and coal, 25 to explosions of gas and dust, 11 to mine cars and locomotives, 9 to electrical shocks and burns, and 3 to explosives, including premature blasts, etc. There were no strikes of serious consequence in the coal mines of the State during the year.

EDUCATION. In July, 1912, the total number of persons of school age in the State was 727,297, of whom 309,273 were white, and 328,024 colored. The total enrollment in all schools was 298,648 white and 146,457 colored. The teachers employed were white male teachers, 2886, and white female teachers, 5086. The colored male teachers numbered 957, and the colored female teachers 906. The average yearly salary for male white teachers was \$410, and of female white teachers \$334. Of colored male teachers it was \$175 and colored female teachers \$155. The total disbursements for educational purposes in 1912 was \$3,703,711. Alabama is one of the backward States in furthering education of its citizens. This is the result largely of local conditions, and efforts are being made to bring about better results. These are chiefly along the lines of improving elementary schools by a closer supervision, by

the grading of schools, and by the vitalizing of school work.

FINANCE. There was a balance in the treasury at the close of the fiscal year 1912 of \$262,052. The receipts from October 1, 1912, to September 30, 1913, were \$6,288,992. The disbursements for the same period were \$6,451,776, leaving a balance in the treasury at the close of the fiscal year of \$99,267. The principal receipts are from taxation. The principal disbursements are for State institutions, education, and State officers.

CHARITIES AND CORRECTIONS. The institutions under the control of the State include the Alabama Home for Refuge, the insane hospitals, Industrial School for White Boys, the Mercy Home, Industrial School for White Girls, the State prisons, the Reform School for Juvenile Negro Law Breakers, School for the Deaf, School for the Blind, School for Negro Deaf and Blind, and the Confederate Soldiers' Home. There is no board or commission directly in charge of the charitable and correctional institutions in the State.

POLITICS AND GOVERNMENT. There was no meeting of the legislature in 1913. Alabama is the only State in which sessions of the legislature are held every four years. The last was held in 1911, and the next regular session begins January 10, 1915. The chief political interest in the State during the year centred in the campaign for United States senator to succeed Joseph F. Johnston, who died August 8. The constitutional amendment providing for the election of United States senators did not provide directly for the filling of vacancies while the legislature was not in session. There was doubt, therefore, as to the method of procedure to be followed. Governor O'Neal announced that he would call a special senatorial election, and with the Attorney-General of the United States, upheld the validity of this action in a statement on August 8. The right of the governor to hold a special election, however, was questioned, and he decided to await the advice of the congressional delegation. The governor was advised by the Senate that he could not appoint a senator without special authorization from the State legislature. On August 12, however, he named Henry D. Clayton, a representative of Congress, to fill the vacancy. Before the Senate could take action on Mr. Clayton's credentials, he declined the appointment at the request of President Wilson, who urged him to continue his place in the House of Representatives in order to assist the President in formulating certain important measures in the future. Mr. Clayton is one of the most conspicuous members of the House, and was chairman of the committee on the judiciary in the Sixty-third Congress. Mr. Oscar W. Underwood, the leader of the House and chairman of the committee on ways and means in charge of the tariff bill, announced his candidacy for the senatorial nomination on October 6. Representative Richmond P. Hobson had already entered the contest for the nomination against Senator Johnston. In a speech delivered in the House on October 14, he charged Mr. Underwood with being a tool of Wall Street, and of the liquor interests. He quoted Secretary Bryan as being opposed to Mr. Underwood. In reply, Mr. Underwood denied the truth of these charges, and declared that he and Secre-

tary Bryan were now on the friendliest terms. On November 13 Governor O'Neal declared that he would make an appointment to fill the vacancy without calling a special meeting of the legislature, and on November 17 he appointed Frank P. Glass, editor of the *Birmingham News*, to serve out the unexpired term of Senator Johnaton. On December 12 Mr. Hobson again attacked Mr. Underwood in the House, declaring for a second time that the latter was a tool of the liquor interests, and Mr. Underwood again denied these allegations.

OTHER EVENTS. On March 18 President Oakley of the State convict board was arrested for embezzling, following the disappearance of Theo Lacy, chief clerk of the convict bureau, with a shortage of about \$115,000 in his accounts. Lacy's whereabouts were still unknown at the end of the year.

Late in December the dam of the Alabama Power Co. at Lock 12 on the Coosa River was closed and the formation of the lake begun. This power plant represents an investment of \$3,000,000 and will supply electric energy to Montgomery, Birmingham, Anniston, Gadsden, Huntsville, and intervening cities.

In December the Fairfield wire mill of the American Steel & Wire Company, a subsidiary of the U. S. Steel Corporation, was completed. Its cost was about \$3,250,000.

On December 16 announcement was made that the Limited Gas & Electric Company had purchased control of the American Cities Company, the latter company being the owner of the Birmingham Railway, Light & Power Company and street railway, electric lighting, and gas companies in other Southern cities.

STATE GOVERNMENT. Governor, Emmett O'Neal; Lieutenant-Governor, W. D. Seed; Secretary of State, Cyrus B. Brown; Auditor, C. B. Smith; Adjutant-General, J. B. Scully; Attorney-General, R. C. Brickell; Treasurer, John Purifoy; Superintendent of Education, W. F. Feagin; Commissioner of Agriculture, R. F. Kolb; ex-officio Commissioner of Insurance, Cyrus B. Brown—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, J. R. Dowdell; Associate Justices, Ormond Somerville, A. D. Sayre, John C. Anderson, Edward de Graffinried, J. J. Mayfield, and Thomas C. McClellan; Clerk, R. F. Ligon—all Democrats.

STATE LEGISLATURE, 1913. Democrats: Senate, 34; House, 103; joint ballot, 137. Republicans: Senate, 1; House, 4; joint ballot, 5. Democratic majority: Senate, 33; House, 99; joint ballot, 132.

The State representation in Congress will be found in the article UNITED STATES, section Congress.

ALABAMA, UNIVERSITY OF. A State university for higher education, founded at University, Ala., in 1831. The students enrolled in all departments of the university in 1913 numbered 1250. The faculty numbered 102. The productive funds amount to about \$2,075,000, most of which is furnished by the State, and the annual income to about \$175,000. The library contains about 35,000 volumes. The president is George H. Denny, LL. D.

ALASKA. POPULATION. The population of the Territory remains practically constant. While the decline in placer mining by the old methods has resulted in a decrease of the population in the strictly gold-placer region, in

other sections there has been an increase, especially in southeastern Alaska, due to extensive quartz-mining developments, the growth of the inshore and deep-sea fisheries, and the consequent increase of commercial business. It is probable that in 1912-13 there was a slight increase in the total population. In 1910 the total population including natives was 64,356. The white population in 1913 was estimated at 31,000. Various causes may be assigned for the slow increase in the population of the territory. It is partly due to the decrease in placer mining and partly to the fact that national policies have had an effect of discouraging prospective miners. Lack of transportation facilities has been another important cause, which has operated against the development of promising mining regions.

MINERAL PRODUCTION. The value of the mineral output of Alaska in 1913 was estimated by the United States Geological Survey in December of that year at \$18,900,000, as compared with \$225,378,831 for 1912. The value of the coal output was estimated at \$15,450,000, compared with \$17,145,941 in 1912. There was also a very marked decrease in the copper production, the production in 1913 being estimated at 19,700,000 pounds, valued at about \$3,014,000, while that of 1912 was 28,230,491 pounds, valued at \$4,823,031. As the silver output of Alaska is largely a by-product of gold and copper mining, this also showed a decrease in value from \$316,839 in 1912 to about \$220,000 in 1913. Other minerals, including marble, gypsum, etc., were estimated to have been produced to the value of about \$220,000 in 1913, or about the same as the value of the production of 1912. There were several reasons for the decrease in the value of the output in 1913, as compared to 1912. The most important of these was the condition of the placer-mining industry, which, in spite of the advances made in lode mining, still furnishes two-thirds of the gold output. Less than 40 per cent. of the placer gold was produced by large plants, the balance being obtained from the rich gravels that can profitably be mined by hand methods; therefore marked fluctuation in the placer-gold output is bound to occur, due to exhaustion of bonanza on one hand, and the discovery of new districts on the other. Moreover, these small operations are far more dependent on the local water supply than on the large plant. Under such conditions, stability of placer-gold production cannot be expected. The exceptionally dry summer of 1913, and the fact that the bonanza deposits of the Fairbanks district had, in a large measure, been exhausted, accounted for the decrease in gold output. There was, however, no shortage of gold gravels, but only of deposits which could be mined under high-cost methods of operation. The falling off in the copper output was due solely to the fact that the Kennicott-Bonanza—the largest copper producer in the Territory, was closed down on account of accidents for about one-third of the year. In 1913 deposits of gold gravels were found in two new and widely separated localities—in the upper Matanuska Basin and in the upper Chisana Basin, a tributary of the Tanana River. These discoveries curtailed the gold output in some of the larger camps, because they drew away many miners, and thus cost a shortage of labor.

GOLD. The gold production in Alaska in

1912 was valued at \$17,145,951, compared with \$16,853,256 in 1911. The output from siliceous ores was \$5,002,399, compared with \$4,226,687 in 1911, and from copper ore \$153,552, compared with \$86,569 in 1911. The production of the placer mines in the territory decreased from \$12,540,000 in 1911 to \$11,990,000 in 1912. From the Pacific Coast belt, which includes southeastern Alaska and Prince William Sound, the output of gold in 1912 was \$4,904,753, compared with \$4,265,573 in 1911; from the Copper River and Cook Inlet regions, the output was \$358,401 in 1912, compared with \$313,558 in 1911. From the Yukon and Kuskokwim Basin, \$8,857,797 in 1912, compared with \$9,139,145 in 1911, and from Seward Peninsula and northwestern Alaska, \$3,025,000 in 1912, compared with \$3,135,000 in 1911. The increased output of the territory in 1912 was due chiefly to the increased production from gold-lode mines, particularly of southeastern Alaska, and copper mines. The production also increased slightly from the placer mines of the Inkonon-Iditarod region, but the output of the Hot Springs, Fairbanks, and Seward Peninsula placer mines declined. A little more than three-fifths of the gold production of the territory comes from placer mines, but the rush was declining as the richer gravels are worked out, and the output from gold-quartz and copper mines increases. The output of the Inkonon-Iditarod placer mines increased from \$29,000,000 in 1911 to \$30,000,000 in 1912. The total gold production from the gold-lode mines in Alaska since 1882 is estimated at \$57,811,300 and the total placer output of the same period at \$154,800,848. In 1912 there were about 720 placer mines operated in Alaska, compared with 740 in 1911.

The production of silver in Alaska in 1912 was 515,186 fine ounces, compared with 460,231 ounces in 1911. Of the total production in 1912, 376,593 ounces were obtained from copper ores, 102,807 from gold placers, and 35,696 ounces from the siliceous ores of the lode gold mine.

COAL. The production of coal in Alaska, in 1912, according to the figures of the United States Geological Survey, was 355 tons, valued at \$2840, a decrease from 900 tons, valued at \$7200, in 1911.

COPPER. The production of blister copper in Alaska in 1912 was 31,926,209 pounds, compared with 22,314,889 pounds in 1911. The increase in 1912 was due to the larger production from the Copper River and Prince William Sound districts. The mine production of copper in 1912 was 29,230,491 pounds, the larger smelter production resulting from the treatment of some ore mined the previous year. The important production of copper in Alaska began about 1903, and from that year it has been a steady producer. To the close of 1912, the total production of blister copper was 91,052,543 pounds. The output was entirely from the Ketchikan, Prince William Sound, and Copper River districts. The production in the first-named district has been for several years decreasing, but the production from Prince William Sound district has increased greatly in recent years. In 1912 the production was the largest yet made by this district. In the Copper River district there is but one producing mine, but development of other properties is active.

AGRICULTURE. The agricultural development in the territory has reached a stage which insures it a permanent place. This statement applies generally to the interior country and particularly to the Tanana and Yukon valleys. Work being done at the government experiment stations at Sitka, Rampart, and Fairbanks, is of the greatest importance. The fact that there was but a small increase in the number of farmers in 1913, is due to economic conditions, chiefly to lack of transportation facilities and the cost of surveying homesteads if they are located outside of the few districts where government surveys have been made. The expense of erecting buildings is almost prohibited when prevailing wages for day labor in Alaska are compared with those of the United States. Among the products which have been grown with success are various grains, including barley and oats, alfalfa, potatoes and turnips. The Kodiak Experiment Station, which was injured by the volcanic disaster of 1912, was partly rehabilitated in 1913, and a large area of pasture land was covered with a layer of ashes varying from one to three feet in depth. In order to reestablish the destroyed pasture, a considerable area was sown to grasses. It is believed that the ashes will be a decided benefit to the country after the first effects have worn off. At this station is a herd of purebred Galloway cattle, which have been bred with great success. The governor of Alaska in his annual report of 1913 suggests the possibility of establishing colonies for Scandinavians to develop the agriculture possibilities of the Territory.

COMMERCE. The volume of merchandize shipments, including precious metals and copper, between Alaska and the United States and between the Territory and foreign countries in the fiscal year 1913, was the largest in the history of the Territory. Figures for 1913 are \$67,150,519, compared with \$64,122,506 in 1912. The greatest advance in the shipments from Alaska was in salmon, in which there was an increase of \$21,875,791. Decreases in the shipments of gold and copper were more than balanced by the increase in other items. The merchandise shipments to Alaska from the States amounted to \$20,179,547, compared with \$18,809,270 in the fiscal year 1912. The increased shipments to Alaska were noted in the items of coal, lumber, hardware, provisions, and miscellaneous. The total shipments, including copper but not precious metals, from Alaska to the States in 1913 amounted to \$23,006,246, compared with \$20,776,756 in 1912. The principal shipments of merchandise from the United States to Alaska were of coal, lumber, hardware and machinery, provisions and liquors. Shipments from Alaska to the United States included salmon and other fish, copper, whalebone, furs, gold, and silver.

FISHERIES. The fisheries of Alaska are one of its industrial assets. The fisheries output is second only to the production of gold and other metals. In 1912 there were 23,253 persons engaged in all branches of fisheries during the calendar year. This was an increase of 6231 to the number of persons in 1911. Of the fish taken, salmon is by far the most important. It is estimated that the canned salmon for 1913 would aggregate 3,800,000 cases, a decrease of 250,000 over the pack of 1912. This decrease in the output is partly due to the

heavy pack of 1912 and the resultant low prices prevailing. The value of the canned salmon shipped from Alaska in the fiscal year 1913 was \$16,085,864. Other important fish taken are halibut, cod, and herring. The total value of these shipped in 1913 was \$1,098,211.

NATIONAL FORESTS. The total receipts of the Tongass and Chugach national forests for the fiscal year ending June 30, 1913, were \$52,460, compared with \$53,218 in 1912. The number of areas surveyed and platted for occupancy permits during the year was 120. The total amount of timber cut in these forests during the fiscal year was 33,534,860 board feet. Thirty-five per cent. of the total receipts of the national forests of Alaska is returned to the Territory for the maintenance of roads. On March 3, 1913, the Aleutian Island Reservation was created by executive order for the propagation of fur-bearing animals, reindeer, and fish.

FURS. In the year ending November 15, 1912, fur shipments were made from 120 different places in Alaska. The total of the fur shipments in that year aggregated \$794,156. In 1913, the value of the furs shipped was \$751,345. Sealing operations on the Pribilof Islands were conducted under the direct control of the fur-seal agents of the bureau of fisheries, and as a result of the treaty of December 15, 1911, there is now no pelagic sealing. The season of 1912 was the first that fur-seal herd was not subject to the ravages of pelagic sealers, and it was possible for the first time in the history of the first seals to take the actual census of the herd. The enumeration thus made shows that there were 215,950 seals of all classes. The number of sealskins shipped in 1913 was 3674. These were sold at auction in London on January 1913, the proceeds of the sale being \$130,640. Fox skins taken on these islands in the winter of 1911-12 numbered 384 blue, and 29 white. These were sold at auction in London in March, 1913, the net proceeds being \$20,505. The lot of 28 skins from St. Paul Island was sold at \$131 per skin.

REINDEER. On June 30, 1912, the reindeer of the Territory numbered 38,476, compared with 33,629 in 1911. Of the reindeer, 24,068 were owned by natives. The reindeer industry affects the entire coastal district from Point Barrow to the Alaska Peninsula. A line connecting the fifty-four herds in existence would be more than 5000 miles in length.

EDUCATION. The number of schools of white children outside of incorporated towns was increased by six during the fiscal year 1913, and there was a decrease of one at Tanana, which was incorporated in December, 1912. In 1913, there were 26 schools, employing 37 teachers, with a total enrollment of 943. The school law provides that there shall be at least 20 white children of school age in a community outside of incorporated towns before schools can be established. The territorial legislature at its first session, enacted a law providing for the compulsory education of white children and those of mixed blood, living civilized lives in the Territory, between the ages of 8 and 16 years, residing within two miles of any school outside of incorporated towns. Similar provision was made to the law for compulsory education of native children and children of mixed blood not leading civilized lives, be-

tween the ages of 8 and 16, where such children reside within one mile from the United States Public School. The legislature memorialized Congress to enact legislation for the creation of a board of education and a board of examiners, with not less than two school superintendents for white children in the Territory, together with appropriations to defray expenses of the proposed boards. The total expenditures for white schools outside of incorporated towns in the school year 1912-13 was \$53,160.

TRANSPORTATION. There was no railway constructed in Alaska during 1913. Of the 466 miles of track previously built, only about 260 miles were operated. This is largely due to the high cost of fuel and to the tax of \$100 a mile on all operating lines. These conditions tended to discourage the railways, especially those which are but partially completed. A new feasible railroad route, from Portage or Passage Bay on the west side of Prince William Sound to Turnagain Arm, was discovered in 1913. A route was found which by use of a tunnel about two miles in length, will avoid the glaciers and yield low grades of both in- and out-bound traffic. The distance from tidewater on Prince William Sound to tidewater on Turnagain Arm is about 12 miles, and the proposed line will join the Alaska Northern Railroad at about miles 63. By use of this route the distance from tidewater to the Matanuska coal field can be reduced to 136 miles.

Communication with Fairbanks was made in 1913. During the summer, several automobile trips were made over the military wagon road. A new direct steamboat system was established between upper Yukon points and Fairbanks. Wagon road and trail construction was continued by the Alaska Road Commission in different parts of the Territory, thereby reducing cost of transportation to various mining camps. It is emphasized more and more each year that the railway construction is of first importance to Alaska, and second only to this is the building of a system of tributary wagon roads.

On June 10 the rolling stock and track-
age of the Alaska Northern Railroad were turned out to a committee of business men, to be used for the benefit of the public, because of a demand by the Federal government for \$67,000 due for taxes. The company asserted that it was relieved of the payment of these taxes until 1916.

The importance of railways in the development of the resources of Alaska was forcibly shown in a letter written by the Secretary of the Interior, Mr. Lane, to Senator Pittman, the chairman of the Senate's committee on Territories, in June. The bill relating to the administration of the government of Alaska provided for the construction by the national government of a railway system in the Territory. The Secretary of the Interior declared that he believed that this was the right policy and that it was necessary for the safe and quick development of Alaska. He regarded it, indeed, as the only way, and pointed out that England in Africa, Russia in western Asia, and the plans for the development of China, all centre upon the railways.

Mr. Lane definitely favors governmental ownership of Alaskan railways. He considers Alaska's future not as that of a land of mines and fisheries, but of towns, farms, mills, and

factories, with millions of people, and the first step towards such a condition, he declared, was the building and owning of railways by the United States. These railways will connect the fertile valleys of the interior with the coast and bring to the world's markets Alaska's coal mineral resources.

POLITICS AND GOVERNMENT

LEGISLATURE. The first legislature of the Territory convened on March 3, 1913. Members for the Territorial Legislative Assembly had been elected on November 5, 1912. The legislature consists of 24 members, 8 in the Senate, and 16 in the House. Two senators and four representatives were elected from each of the four judicial divisions. The session of 1913 lasted 60 days. A considerable number of laws of a constructive character were enacted. The first law passed extended the elective franchise to such women in the Territory as have the qualifications of citizenship required of male citizens. In all, 84 laws were passed, embracing a wide range of subjects together with 71 memorials and resolutions touching matters of interest to the people of the Territory, upon which the legislature is without power to act.

TERRITORIAL OFFICERS. In July Walter E. Clark was succeeded as governor of the Territory by J. F. A. Strong. The Territorial legislature at the first session created the office of the Territorial treasurer, and Walstein G. Smith was appointed to this position on July 1, 1913. Other officers are secretary to the governor, William A. Shorthill; ex-officio secretary of Alaska, Charles E. Davidson; delegate to Congress, James Wickersham.

On October 5, the city of Nome suffered great loss on account of the worst storm ever known since the settlement was made. Five hundred houses were demolished by the sea. This was followed by fire, and the total loss was about \$1,500,000. The electric light plant of the city was wrecked, and tug boats and other small craft were destroyed. The mining camp of Solomon, 40 miles eastward, was also destroyed by the storm. See also **EXPLORATION, North America.**

ALBANIA. An independent state created by the provisions of the treaty of London (May 30, 1914), under the rule of a Christian prince; previously a Turkish possession. Under the Turkish régime the name Albania was given to an indeterminate area embracing the vilayets of Scutari and Yanina, with portions of Kossovo and Monastir. Certain portions of the original Albania were distributed among the Balkan states after the war with Turkey, and the remainder, covering some 28,000 sq. kilometers, carrying an estimated population of 800,000, was erected into a separate and independent principality. The principal towns are Scutari, Durazzo, Valona, and Koritsa. The boundaries will be delimited by an international commission. Prince designate, William Frederick Henry of Wied, born March 26, 1876; married (Nov. 30, 1906) to Princess Sophie of Schönburg-Waldenburg. They have issue a daughter (born Feb. 19, 1909) and one son, Prince Carol Victor, born at Potsdam May 19, 1913.

HISTORY. One of the causes of the Balkan War of 1911-1913 was the chronic unrest and disorder among the Albanian tribesmen and the apparent inability of the Turkish

government to suppress a particularly violent outbreak in the summer of 1912. One of the results of the Balkan War was the freeing of Albania from Turkish suzerainty and its emergence as an independent state. How this was brought about is treated at some length under **TURKEY AND THE BALKAN PEOPLES**; it will suffice in this place to emphasize such elements in the Balkan situation of 1913 as relate closely to Albanian affairs.

From the outset of the Balkan War in October, 1912, it was obvious that Montenegro, Servia, and Greece planned to tear Albania from Turkey and divide it among themselves: Montenegro directed its main attack against Scutari; Servia sought to appropriate the greater share of northern and central Albania, including free access to the Adriatic, especially the coveted port of Durazzo; and Greece hoped to realize her ambition to possess Janina and the more or less Hellenized portions of southern Albania. Now while the Albanians objected to Turkish rule, they were even more determined not to accept either Serb or Greek control. Consequently, Essad Pasha's Turkish garrison in Scutari was able, with native tribal assistance, to make a long and valiant defense against Montenegrin attacks, and at Valona, on November 28, 1912, several Albanian leaders, headed by Ismail Kemal Bey, formally proclaimed the independence of Albania and set up a provisional government.

For many years both Austria-Hungary and Italy had been developing important commercial and industrial interests in Albania, and both powers were known to cherish hopes of political supremacy in the country. Although they could not agree on any scheme for a territorial division between themselves, they were firmly united in their determination to prevent the absorption of Albania by Greek and Serb. They therefore sympathized with the declaration of independence on the part of Ismail Kemal Bey's provisional government; and, with the aid of their ally, Germany, they brought sufficient pressure to bear upon the Ambassadors' Conference of the Great Powers assembled in London, to secure general recognition of the principle that Albania should be an autonomous state, that Servia should have no territorial extension to the Adriatic, and that Scutari should be incorporated in the new principality. As soon as this principle was accepted, the ambassadors' conference proceeded to settle the boundaries in a general way and to prepare for the erection of a permanent government.

Russia, as the great power especially friendly to the Slavic states of the Balkans, was by no means pleased with the determined attitude of Austria-Hungary and Italy, and, with the aid of her partners in the Triple Entente, France and Great Britain, managed to secure some concessions for Servia. It was thus decided that Servia should have commercial access over Albanian territory to the Adriatic, probably to the port of Durazzo, and that the northern and eastern frontier of the new state should be so drawn as to incorporate important Albanian districts in the enlarged Servia and Montenegro. While the ambassadors' conference, by agreement of March 26, still guaranteed Scutari to Albania, they handed over to Servia and Montenegro the debatable districts of Ipek, Pristend, Dibra, and Djakova.

The right of the great powers to delimit the boundaries of Albania and provide for its government was fully confirmed by the treaty of London, signed on May 30, between Turkey and the Balkan allies.

Meanwhile the provisional government of Ismail Kemal Bey at Valona was doing its utmost to preserve order throughout the country and to prevail upon the powers to extend the country's boundaries. A congress of Albanians, which met at Trieste on March 1, urged the annexation of Janina, Monastir, and Uskub, and emancipation from the tutelage of Europe. To these proposals, however, the great powers turned deaf ears. Only in the case of Scutari, which Essad Pasha had been obliged to surrender to the Montenegrins on April 23, did the powers bring actual armed pressure to bear upon any of the Balkan allies: an international naval force, headed by the British admiral, Sir Cecil Burney, occupied that city on May 14, in the name of the principality of Albania. The settlement at Scutari released the redoubtable Essad Pasha from his duties there and enabled him to take an active part in Albanian politics. After fruitless efforts to have himself recognized as "king" of the new state, he joined the provisional government of Ismail Kemal Bey as minister of the interior. It was not long before he quarreled with his chief and set out on a trip to Italy and Austria-Hungary to register a strong protest against the existing régime in his country. Upon his return in September, he repaired to Durazzo, where, in the following month, he solemnly proclaimed a new government, separate and apart from that of Ismail Kemal Bey at Valona. In his proclamation, Essad Pasha denied any intention of wishing to split Albania permanently into two parts but excused his action on the ground of Ismail Kemal Bey's vacillating character and neglect of the northern districts. The Durazzo government claimed authority from the River Mat to the Shkumba, including Tirana, Kroia, Kavaja, Pegin, and Shiak: it would be conducted by two senators from each district with Essad as the head. Its author promised that it would last only until the powers had established a permanent government for the whole country.

While Ismail Kemal Bey and Essad Pasha were quarreling with each other and thereby giving rise to increased disorder among the tribesmen, the ambassadors' conference in London persevered in its work. Late in July it was agreed that Albania should be governed by a prince, who would be nominated at the end of six months, the administration of the country in the meantime being placed in the hands of an international commission of control, consisting of one representative of each power and one Albanian; this commission would be directed to make recommendations to the powers for the permanent organization of the country. It was likewise agreed that a gendarmerie should be speedily organized under Dutch officers. In October the Commission of Control was duly installed at Valona with the following foreign members: Great Britain, Mr. H. Lamb; France, M. Krajevsky; Austria-Hungary, M. Petrovich; Russia, M. Pebriajeff; Germany, H. Winkler; Italy, Sig. Leoni. It was arranged that the post of president should be held in turn by each of these members for a month at a time in alphabetical order accord-

ing to the nomenclature of their countries in the French language, the presidency for the first month being accordingly entrusted to the German representative.

Next to the establishment of the Commission of Control the most important Albanian problem facing the powers was the delimitation of the frontiers. To solve this problem two international commissioners were created, both composed of representatives of the six great powers, the one, that of the north, charged with delimiting the Montenegrin and Servian frontiers, the other, that of the south, empowered to locate the Greek boundary. These commissions simultaneously began their work of surveying in October. The northern commission in attempting to conform to the agreement of March 26, which has been mentioned above, encountered two chief difficulties. In the first place, two of the five tribes of the Malissori—the Hoti and the Gruda—had been transferred to Montenegrin sovereignty much against their will, and the resultant fighting in the mountains south and east of Scutari made surveying most dangerous. Then, in the second place, the incorporation of Dibra in the Servian kingdom was particularly resented by the Albanians; an armed force of tribesmen seized the town, and it was recovered by the Servians only after two weeks of fierce fighting. But the difficulties of the northern commission were slight as compared with those which beset the southern commission. In a general way, the ambassadors' conference at London by agreement of August 11 had so far settled the Græco-Albanian frontier that it would run from a point south of Cape Stylos to Lake Orchida, incorporating the largely Hellenized district of Koritza in Albania. It was now decided that the southern commission, in drawing the line definitely, should take into account the language and nationality of the populations in debatable areas. This was the signal for frantic efforts on the part of Greek frontiersmen to assail the Albanians, and on the other hand for Albanians to slaughter Greeks. The labors of the commission were further handicapped by the curious fact that only the Austro-Hungarian and Italian delegates were actually proficient in the languages spoken by the inhabitants. Under these circumstances little headway was made until, early in December, the powers adopted a compromise proposed by Great Britain to the effect that the southern commission should not inquire into the nationality of the population but should endeavor to arrive at a *modus vivendi* between the pretensions of Greece on one hand and those of Albania, backed by Austria-Hungary and Italy, on the other. This compromise enabled the commission to complete its work on December 18, when it awarded Tepclena, Argyrocastro, Kolonia, Premetti, and Leskoirk to Albania and the Cazas of Konitza and Pogoni to Greece. It was likewise arranged that the new Albanian territories then occupied by Greek forces should be evacuated by January 20.

In November a "national" bank was founded at Valona with Italian and Austro-Hungarian capital. On November 28, the anniversary of the proclamation of Albanian independence was observed as a national holiday and official recognition was accorded to the provisional government at Valona; delegates of the Commission of Control and the three consuls resident in the

city—Austro-Hungarian, Italian, and Bulgarian—paid a state visit to Ismail Kemal Bey, and the foreign gunboats in the harbor fired a salute of twenty-one guns. Reports passed current that the powers would nominate as first prince of Albania the Protestant German Prince William of Wied, a relative of the Queen of Rumania (Carmen Sylva). Prince William visited Rumania and Italy in the autumn, and it was anticipated that he would arrive in Albania in January.

ALBEDO OF THE EARTH. See **ASTRONOMY.**

ALBERTA. A province of the Dominion of Canada, between British Columbia on the west and Saskatchewan on the east. Area, 255,285 square miles; population (1911 census), 374,663, representing an increase of 413.1 per cent. in ten years. Population of the cities (1911 census): Calgary, 43,704; Edmonton, the capital, 24,900; Lethbridge, 8050; Medicine Hat, 5608; Strathcona, 5579; Wetaskewin, 2411. Since the census the population of the province and especially of the two largest cities has greatly increased. Alberta became a province of the Dominion September 1, 1905. The chief executive is the lieutenant-governor, who is appointed by the governor-general of Canada; he acts through an executive council (responsible ministry) of eight members. The Legislative Assembly consists of 58 members, elected by direct vote for five years. Lieutenant-governor in 1913 (since September 1, 1905), George Hedley Vicars Bulyea; premier in 1913, A. L. Sifton. See **CANADA.**

ALCOHOL. The mooted question as to whether alcohol occurs normally in the blood and body-tissues, was taken up by Schweisheimer, who found minute quantities amounting to about 0.003 per cent. of a volatile, oxidizable substance, in normal animal blood and tissues. This agrees with previous investigations, and although Schweisheimer believed this substance to consist largely of alcohol, chemical limitations prevented its absolute identification. More important, however, than this work was the determination of the alcohol content of the blood of individuals in various stages of intoxication. Schweisheimer found that there were striking differences in the behavior of the alcohol in the blood of habitual drunkards and in that of abstainers; in the latter the maximum absorption occurred in from one to two hours after drinking a liter of wine containing 10.35 per cent. of alcohol and remained stationary for five to six hours, with practically entire disappearance in 12 hours. The habitué, on the other hand, showed a maximum absorption which occurred very quickly, was maintained only about two hours, and then rapidly disappeared. It was also noted that in the chronic alcoholic, the maximum content was much lower with the same dose than in the abstainer. With the dose given above, the alcohol content in the blood ranged between 0.1 to 0.15 per cent., while in the subject thoroughly saturated with alcohol from 0.12 to 0.23 per cent. were found. These results indicated that the chronic alcoholic is able to eliminate alcohol more rapidly than the occasional drinker. This was a fact commonly recognized, but the experiments throw no light on the manner in which it is accomplished. Other observations taken with abstainers, moderate drinkers and confirmed alcoholics, demonstrated that a progressive ability to keep down the quantity

of alcohol in the blood and tissues is persistent, thus agreeing again with common observation that this faculty is gradually acquired. The practical usefulness of these findings lies in the help they may offer in the differential diagnosis of cases of coma which occur in the streets of every large city and often result in a mistaken diagnosis of alcoholism for fracture of the skull, uremia, or unconsciousness from other causes. Many cases of this kind are consigned to a police-station cell which should properly be hurried to a hospital.

Another old but fascinating problem about which various observers seem unable to agree, namely, as to whether alcohol is or is not a food, was studied by Durig of Vienna. The classical experiments of Atwater and Benedict in 1912 showed that 99 per cent. of moderate amounts of alcohol were actually oxidized in the body as completely as ordinary food and left the body in the form of heat. It was also shown that alcohol protects the body fat, and to some extent the protein, from consumption. What these experiments do not show is that the energy arising from the oxidization of alcohol can be transformed into muscular work, although Atwater and Benedict consider it "highly probable." Durig's experiments endeavor to solve the question as to how far alcohol can really replace carbohydrate in nutrition. His subjects were given large amounts of sugar with and without the addition of alcohol, and his experiments were so planned that if the oxidization of alcohol resulted merely in the production of waste heat, as has been urged by the partisans of the anti-alcohol school, its products would be added to that of the sugar which was always abundantly available. His results showed apparently that there was no waste under such conditions; in spite of the large amount of sugar available, it was conserved for the production of energy by the alcohol, which was burned to replace it. It is often contended that such conservation of food-stuffs by alcohol is due to a paralysis or inhibition of all the metabolic processes by the toxic effects of the drug. In commenting upon Durig's work an editorial writer in the *Journal of the American Medical Association* remarks that we cannot point out too emphatically that they do not commit us to the proposition that alcohol is an excellent or even advantageous food, and that to acknowledge it is a food is not to deny that it is also a dangerous one. If it is taken too freely, it is not completely oxidized and its evil effects on the nervous system are undeniable. While it may have its occasional uses, especially in illness, to encourage its use in the regimen of daily life on the grounds of nutritive necessity would be indefensible.

WOOD ALCOHOL. This substance is known to be an insidious and dangerous poison, exercising a selective action upon the nervous tissues. But, while many cases of blindness or death have been reported, until lately very little has been found out concerning its action upon the blood. Miura undertook the study of this subject and added some new and important facts to our knowledge of the subject. According to this investigation the blood-forming tissues are seriously affected by the poison. There is a production of anemia, with a decrease in certain of the white blood corpuscles, an attendant albuminuria, and the appearance of bile

pigments in the urine. In Hungary, where it is the custom to drink tea flavored with rum, there occurred some years ago a number of cases of blindness, and investigation brought out the fact that brandy and other liquors were producing this blindness and in some cases death. It was found by Telletar that the toxic agent was wood alcohol, which is manufactured in Hungary for industrial purposes. Continued investigation disclosed the fact that even prolonged working with paints containing wood alcohol may cause blindness, simply from inhalation of the fumes. In one factory several workmen were found suffering from beginning atrophy of the optic nerve, and legal steps were taken to protect workmen thus engaged. See also CHEMISTRY, INDUSTRIAL, and INSANITY.

ALFALFA. The reports from alfalfa-producing countries in 1913 indicated an average yield. Definite figures as to production were not available for many countries and hence statements regarding the world's production must be always based on general estimates. Germany produced 1,830,000 tons of alfalfa hay, the average yield being 2.95 tons per acre, as compared with 1,642,000 tons in 1912 and 1,203,300 tons in 1911, with average yields per acre of 2.48 and 2 tons respectively. The latest data on production and acreage in the United States were published in connection with the census of 1910. The area devoted to the crop is continually increasing and in 1913 was estimated at more than 5,000,000 acres. Statistics published during the year by the State of Nebraska, one of the leading alfalfa States, showed that since 1909 its acreage had increased more than one-third and in 1913 amounted to about 850,000 acres, or over one-fifth of the total acreage in hay within the State. The year's production in this country was estimated at 90 per cent. of a normal crop. An open and dry winter in the principal alfalfa regions of the Mississippi Valley proved unfavorable to newly sown alfalfa, but well established fields suffered little or no injury. The first cutting was generally very good in quality and quantity, but the later cuttings over the larger part of the unirrigated region were reduced in yield and quality by the prolonged drouth which characterized the season.

The value and adaptability of alfalfa were still further demonstrated during the year in an experimental way. Feeding experiments at the South Dakota Experiment Station showed that the yellow flowered alfalfa (*Medicago falcata*) is second in feeding value only to the common purple-flowered species (*Medicago sativa*). The Illinois Experiment Station showed that 4 tons of alfalfa hay can be produced per acre and compared with 1½ tons of timothy hay, and that, with timothy hay at \$10.00 per ton, an acre of alfalfa hay was worth \$68.44 more for milk production when milk sold for \$1.30 per 100 lbs. The New Jersey Experiment Station determined the milk value of an acre of alfalfa at \$74.00. Work on the artificial curing of alfalfa was carried on by private parties in southern Missouri during the year with promising results. The State of South Dakota appropriated \$10,000 for the further importation of hard Siberian kinds of alfalfa and an additional \$15,000 for their distribution and establishment within the State. A campaign for alfalfa culture which attracted widespread attention was conducted throughout

the country by Prof. P. G. Holden with the support of the International Harvester Company.

ALFONSO XIII., ATTEMPTED ASSASSINATION OF. See SPAIN, History.

ALGERIA. A country of north Africa; sometimes called a colony, actually an integral part of the French Republic. Capital, Algiers.

AREA AND POPULATION. The area by departments (in square kilometers), the population, European and native, according to the census of March 5, 1911, and the density per square kilometer are shown in the following table:

Departments	Sq. kms.	Europeans	Natives	D
Algiers	54,540	271,767	1,421,819	31
Constantine	87,802	155,654	1,945,443	24
Oran	65,897	319,089	892,212	19
Algeria proper.	207,739	746,510	4,259,474	24
Southern territories	367,650	5,533	481,052	1
Total	575,289*	752,043	4,740,526	19

* 222,119 sq. miles.

Algiers had in addition the population counted apart 27,295, making total population 1,720,881; Constantine, 17,349—total 2,118,446; Oran, 18,894—total 1,230,195. Total Algeria proper, 5,080,522. Southern Territories: 7721 counted apart—total 494,306. Total Algeria, 5,563,828. Total number of births in 1910, 148,635 (of which, 21,378 European); deaths, 106,619 (13,003); still-births, 2065 (716); marriages, 41,294 (5605). Algiers had (1911): 172,397; Oran, 123,086; Constantine, 65,173; Bone, 42,039; Tlemcen, 39,874; Blidah, 35,461; Tizi-Ouzon, 31,404; Sidi-bel-Abbes, 30,942; Philippeville, 27,137.

PRODUCTION. In 1910 the area under vines was 152,100 hectares, producing 8,414,000 hectoliters of wine; under cereals, 3,001,000 hectares, 22,147,000 quintals; roots, legumes, etc., 89,300 ha., 1,319,000 qs.; forage plants and sown grasses, 26,000 ha., 822,000 qs.; natural pastures, 851,000 ha., 3,871,000 qs. harvested; number of fruit trees in bearing, 9,985,000; number of olive trees, 6,655,000, producing 3,364,000 quintals of olives, 351,000 hectoliters of oil. In the table below are shown area under principal cereals, production in quintals (1912 and 1913), and production per hectare (1912):

	Hectares		Quintals		Qs.
	1912 *	1913 †	1912 *	1913 †	ha.
Wheat a..	1,110,233	952,568	5,421,511	7,500,000	4.9
Barley...	1,388,212	1,275,551	7,160,292	10,893,085	5.2
Oats....	192,460	217,932	1,972,713	2,608,868	9.8
Vines b..	6,671,181	7,430,738	...

* Actual. † Provisional. a Excluding the department of Algiers. b Production in hectoliters of wine.

Livestock, 1911: 226,764 horses, 192,484 mules, 279,315 donkeys, 1,113,952 cattle, 8,528,610 sheep, 3,861,847 goats, 110,012 swine.

Iron, copper, quicksilver, zinc, and lead mines are worked.

COMMERCE AND COMMUNICATIONS. The general commerce of the country is shown below for five successive years in thousands of francs:

	1907	1908	1909	1910	1911
Imports..	475,998	476,343	482,997	543,197	611,619
Exports..	365,800	345,288	357,650	544,919	548,510

The special trade amounted in 1910 to 511,967,000 francs and the exports to 513,267,000. The principal exports (special trade) and values (thousands of francs) in 1911 were: Wine, 207,698; cereals, 80,492; live animals, 34,193; table fruit, 15,902; iron ore, 12,000; phosphates, 10,977; tobacco, 10,047; zinc, 9925; cork, 9784; legumes, 9718; wool, 8184; skins, 7837; esparto, 7166; flour, 6031; vegetable fibre, 4677; olive oil, 4489; potatoes, 3611; potassium 3565; semolina, 3542; spirits, 3496; fish, 3130; bran, 2517; lead, 2396. The imports from France in the special trade (1910) amounted to 437,896,000 francs out of a total of 511,967,000 francs; the exports to France, to 410,367,00 out of a total of 513,267,000. Morocco ranked second and the United Kingdom third in the list of countries of origin. Vessels entered in the 1910 trade, 5003 of 5,691,063 tons. The merchant marine included, January 1, 1911, 980 vessels of 31,771 tons.

There were in operation, December 31, 1911, 3297 kilometers of main railway line, and 150 kms. of local line. The telegraph lines comprehended 15,199 kms., and the wires 39,652. Post offices, 661; telegraph offices, 720; telephone stations and offices, 7398.

FINANCE AND GOVERNMENT. The revenue for 1908 amounted to 115,186,178 francs and the expenditure to 108,078,035 francs; 1911: 141,029,548 and 125,086,215. The budget for 1912, as voted December 29, 1911, estimated the total receipts at 145,167,014 and the total expenditure at 145,155,971 francs; budget of the Southern Territories: 6,523,301 francs revenue, 6,513,284 francs expenditure. The 1913 budget, as voted December 27, 1912, estimated the revenue at 157,225,334 francs (of which 42,470,000 francs extraordinary, 50,078,764 indirect taxes, customs, stamps, etc., 14,063,086 direct taxes, 9,133,391 posts, telegraphs, etc., 29,378,058 *recettes d'ordre*); the expenditure was estimated at 157,196,940 francs (debt charge 25,012,056, interior 27,370,159, public works, 20,647,538, posts and telegraphs 13,328,265, extraordinary 42,470,000).

Each department has a senator and two deputies in the national assembly, which has sole legislative authority in Algeria. A governor-general represents the republic and administers the country (1913, M. Lutaud).

ALGIN. See **CHEMISTRY, INDUSTRIAL**, under *Paper*.

ALIENS. See **IMMIGRATION**.

ALLEN, CHARLES, died January 13, 1913. He was born in Greenfield, Mass., in 1827, and graduated from Harvard College in 1847. In 1850 he was admitted to the bar, and practiced law in Greenfield until 1862, and after that in Boston. From 1861-67 he was reporter of decisions of the Supreme Judicial Court of Massachusetts. From 1867-72 he was attorney-general of the State; in 1881 chairman of the commission to revise the statutes of Massachusetts; in the following year appointed chief justice of the State Supreme Court, in which capacity he served until 1898. He wrote: *Allen's Massachusetts Reports* (1861-69); *Telegraph Cases* (1873); *Notes on the Bacon-Shakespeare Question* (1900).

ALLOYS. See **CHEMISTRY, INDUSTRIAL**.

ALSACE-LORRAINE. See **FRANCE, History**; and **GERMANY, History** (*Zabern, or Saverne, Incident*).

ALTERNATORS. See **DYNAMO-ELECTRIC MACHINERY**.

ALTMAN, BENJAMIN. An American merchant and art collector, born in 1840, died October 7, 1913. He started business in a small store in Sixth Avenue between 20th and 21st streets, about 25 years before his death. The business was successful from the first, and five years later it removed to Sixth Avenue and 19th Street. Additions were made to this store, until it became one of the most imposing department stores in New York. In 1905 Mr. Altman erected a large store on the east side of Fifth Avenue, between 34th and 35th streets, and in 1913-14 an addition to this was erected on 34th Street and Madison Avenue. This made the establishment one of the largest department stores in the world. While Mr. Altman was a most successful merchant, he was perhaps better known as an art collector. He employed his leisure time in forming a large and remarkable collection of old masters. His collection of Rembrandts, 14 in number, is believed to be the largest in the United States. In 1912 he purchased Velasquez's portraits of King Philip IV. of Spain, and his minister Olivares; it is said that he paid for these nearly \$1,000,000. The collection also included pictures of Filippo Lippi, Holbein, Francia, and Botticelli. His Chinese porcelains, rugs, and crystals were of great beauty and value. Mr. Altman died without near relatives, and left his business to be directed largely for the benefit of the employees, to whom he made in addition large bequests, varying with the length of service. The greater part of his collections were left to the Metropolitan Museum of Art, New York City, and they represent perhaps the largest single gift ever made to that institution. Mr. Altman's estate was valued at about \$30,000,000.

ALUMINUM. The production of aluminum in the United States in 1912 was by far the greatest in any year in the history of the industry. There were produced 65,607,000 pounds, compared with 46,125,000 in 1911, and 47,734,000 in 1910. The total production since the beginning of the industry in 1883 is 305,358,779 pounds. The total value of the exports of aluminum in 1912 was \$1,347,621, compared with their value in 1911 of \$1,158,603. During the year the Southern Aluminum Company, with a capital of several million dollars, was organized by an amalgamation of aluminum producers in France, Switzerland, and the United States. The company carried a water-power site at Yadin River near Whitney, North Carolina, and made immediate plans to erect a plant with a large capacity for the manufacture of metallic aluminum. The Aluminum Company of America secured during the year rights in North Carolina and Tennessee, and planned the development of water-power for use in an aluminum plant to be constructed at such a point as will insure good freight rates and an adequate labor supply. The company has also made additions to this plant at Massena, N. Y., which, when completed, will be one of the largest in the world. A recently developed branch of the aluminum industry is the manufacture of powdered metal known to the trade as aluminum-bronze powder, and used extensively as a paint pigment, in explosives, in lithographing, and in printing. Aluminum foil has largely displaced tin foil for wrapping articles such as

cheese, candies, tobacco, etc. The use of metallic aluminum in the manufacture of cooking utensils and other articles of domestic use is being extended on a much larger scale than in previous years. Successful experiments have been made in bringing aluminum to a liquid condition so that it may be spread, when cold, over any dry surface. The composition is applied like paint with a brush, and looks when spread like a dull silver coating.

See also **CHEMISTRY, INDUSTRIAL**.

WORLD'S PRODUCTION OF ALUMINUM
(As reported by Metallgesellschaft, Frankfurt a. M., in Metric Tons—2204.62 pounds)

AMATEIS, LOUIS. An American sculptor and designer, died March 18, 1913. Born in Turin, Italy, in 1855, graduated from the Turin Institute of Technology in 1880, he studied in Paris and Milan, removing in 1883 to New York City, where he remained until 1892, when he was appointed head of the department of fine arts at George Washington University. Here he remained until 1899. Among his best-known works are the bronze doors on the west main entrance of the Capitol at Washington, and busts of President Arthur, James G. Blaine, and Andrew Carnegie.

AMEN, HARLAN PAGE. An American educator, died November 9, 1913. He was born at Sinking Spring, O., in 1853, and graduated from Harvard University in 1879. After teaching in several academies until 1895, he was appointed principal and professor of Latin at Phillips Exeter Academy. He was prominent among the educators of the country, and received the degree of A. M. from Williams College in 1886, and Litt. D. from Dartmouth College in 1911.

AMHERST COLLEGE. An institution for higher education, founded in Amherst, Mass., in 1821. The students enrolled in all departments in the autumn of 1913 numbered 425; the faculty numbered 50. There were no noteworthy changes in the faculty during the year and no notable benefactions were received. The productive funds amount to about \$2,670,000, and the annual income to about \$230,000. The library contains about 105,000 volumes. The president is Alexander Meiklejohn.

ANÆSTHESIA. Crile's observations on the behavior of animals and persons under anæsthesia and the relation of anæsthesia to surgical shock, led him to adopt a special method of preparing patients for surgical operation, and for selecting an anæsthesia, to which he applies the term "anoci-association." He holds that while the conscious brain is asleep the subconscious mind is alert and impressionable to painful sensations; that is, while certain cells of the brain are unconscious, other cells are wide awake and endeavoring to escape the injuries incident to the surgical procedure. This belief is based on the observation that changes in the pulse, respiration, and blood-pressure accompany every attack upon the tissues, and leads to the conclusion that these changes represent an effort to escape from injury. He compares this condition with that which would occur if a patient were operated upon while under the influence of curare, when the patient, while not able to move or utter a sound, would be perfectly conscious and alive to pain sensations. It has been shown that animals subjected to injury, while under the influence of curare and morphine, succumb to shock much more readily than they do under ether. The object, then, of the surgeon should be to spare the patient from psychic as well as physical shock and to disconnect temporarily the brain from the field of operation. In all parts of the body there are innumerable nerve receptors. Some of these have the function of protecting the body against harmful or noxious contacts. These are called "nociceptors," and they are found most abundantly in those parts of the body which in the course of evolution have been subjected to injury; as, for example, the hands and feet. In the protected parts of the body there are few nociceptors, and in the brain, which has always been protected by the skull, none are found. That is, the brain possesses no pain sense. Injury of an area having nociceptors leads to an exhausting discharge of nervous energy. But equally exhausting discharges of energy may be produced through the special senses, such as hearing or seeing a dangerous enemy. Whatever the cause may be, the stimulus is always through the awakening of associative memory. Harmful or noxious associations are called noci-associations, and when an operation is so carried out that all harmful or noci-associations are eliminated, this state is termed "anoci-association," and it is this state which Crile aims to induce at all surgical operations. The method is briefly as follows. The patient is brought into the best possible mental attitude toward the operation. Where possible a preliminary injection of morphia combined with scopolamine is given, and the management of the patient up to the point of the general anæsthesia is in the hands of nurses, orderlies and physicians who are, in Crile's phrase, "humanitarian psychologists." For short operations and in fact whenever possible, nitrous oxide is used for general anæsthesia. While under the anæsthetic the brain is entirely sundered from the field of operation by local anæsthesia, induced by infiltration with a solution of novocain. The utmost gentleness and accuracy in

handling the tissues is observed. Finally, at the end of the operation, an injection of quinine and urea hydrochloride is given, so as to cut off the zone of operation from communication with the brain, thereby eliminating postoperative pain. By using the above technic Crile claims to attain a practically shockless operation.

SPINAL ANÆSTHESIA. In spite of the occasional ill results of this method of anæsthesia a great many operations have been done, especially by European surgeons. Bedeschi used stovain in 924 cases, in 2 of which there was serious collapse, although the patients did not die. In 10 per cent. there was urinary, and in 30 per cent. fecal incontinence; 2 cases suffered severe paralysis of the legs, which persisted for months. These untoward results led to the discontinuance of the spinal method at Ravenna, where Bedeschi performs his operations. Helm reported 1419 cases by the spinal method, including 105 cases of entire failure to produce anæsthesia. The after-effects were as follows: In 20 per cent. there was headache, 30 per cent. fever, in 6 strong young men meningitis occurred, with one fatality. One hundred and seventy-four patients had suffered subsequently from persistent headache, paresthesia and neuralgia in the legs, and in one case symptoms resembling locomotor ataxia. All finally recovered. The tendency among American surgeons was to avoid this form of anæsthesia except in carefully selected cases.

LOCAL ANÆSTHESIA. Lundgren induced local anæsthesia by sataphoresis, sending into the tissues a solution of cocaine and adrenalin by means of a continued electric current at a tension of 110 volts. Complete local anæsthesia was thus produced in ten minutes and lasted about sixteen minutes, when employing one milliamperes of current; with two milliamperes anæsthesia was induced in five minutes and lasted eighteen minutes, and with two milliamperes used for ten minutes the anæsthesia was lengthened to twenty-seven minutes. Various other combinations of time and strength of solution were experimented with, all going to show that anæsthesia could be controlled both as to completeness and duration by the strength of the current, its length of application, and the strength of the novocain solution.

ANGOLA. A Portuguese colony in western Africa. Estimated area, nearly 500,000 sq. miles; estimated population, 4,200,000. Capital, St. Paul de Loanda. The imports in 1910 were valued at 6,022,294 milreis (5,874,861 milreis in 1909); exports, 3,311,863 (3,485,085); transit, 326,349 (326,349). Vessels entered in the 1910 trade, 479 (1741 in 1909), of 941,000 tons (1,005,000). The budget for 1910-11 showed revenue 2,321,373 milreis, and expenditure 3,171,373. Railways in operation (1912), 1036 kilometers. The railway from Lobito to Benguella on the southwest coast of Africa was completed during the year to 323 miles from Lobito. Telegraph

lines, 4236 kms.; stations, 119; post offices, 481. A governor-general administers the colony—N. de Mattos in 1913.

ANIMAL DISEASES. See VETERINARY SCIENCE.

ANKYLOSTOMIASIS. See HOOKWORM DISEASE.

ANNAM. A French protectorate on the China Sea; a part of French Indo-China (q.v.). It lies south of Tongking and extends as far as Cochin-China, between the coast and a parallel chain of mountains—a length of about 1200 kilometers. It has fertile, well-watered plains and a hot moist climate. Tropical fruits, sugar cane, cotton, indigo, rice (near the coast), and cinnamon thrive; the mountains bear forests of teak and ebony, and enclose hoards of coal, iron, gold, silver, copper, lead, tin, zinc, etc. All Annamese provinces produce silk of a superior quality. The trade is included with that of French Indo-China. The single route of communication is the Mekong, roads properly so-called being unknown. A railway (103 kilometers) connects Hué with Tourane, with an extension to Quang-tri. A line from Saigonto Nha-trang is under construction. Duy-Tan (born 1899, succeeded 1907) is the native king and nominally administers the country under a council of regency. The French resident in 1913 was J. F. Charles. The local budget balanced for 1912 at 3,250,462 piasters.

ANTHROPOLOGY. **ANTQUITY OF MAN AND PHYSICAL ANTHROPOLOGY.** The remarkable find made in December, 1912, by Dawson near Piltdown, Sussex, aroused considerable discussion. Its interest lies in the fact that it differs both from the Neandertalers and *Pithecanthropus*, so that Dr. Smith Woodward goes so far as to assign it not only to a new species, but even to a new genus, *Eoanthropus dawsoni*. The remains consist of part of the left side of the skull and part of the right side of the lower jaw, with two molars, to which there has recently been added a canine tooth discovered by Father Teilhard. Dr. Woodward estimates the brain-capacity at about 1070 cc., and believes the individual to have been of female sex. There is a striking incongruity between the jaw and the upper part of the skull. The forehead is much higher than in the Neandertal finds, and brow-ridges are but weakly developed, so that from these points of view the find is distinctively human. On the other hand, the symphysis of the jaw is characterized by a little piece of bone absent from the Neandertal and Heidelberg mandibles, but shared by the chimpanzee. Thus, while the upper parts of the find are quite human, the jaw seems more primitive than any jaw hitherto found containing human teeth. Woodward's interpretations have been contested by Professor Keith, who assumes a much higher cranial capacity and in general combats the primitiveness of the skull. The Sussex remains are probably contemporaneous with the unworn paleolithic implements of Chelleen type in the same deposit, which fixes their age as Early Pleistocene.

A good and up-to-date popular account of the antiquity of man, embodying even so recent a find as the Sussex skull, was given by Buttel-

Reepen in *Man and His Forerunners* (translated by A. G. Thacker, London, 1913). A fuller description of the Sussex find was given by Professor MacCurdy in the *American Anthropologist*, 1913, pp. 248-256. One of the most comprehensive and valuable of recent works on early man was published by Professor Hugo Obermaier under the title *Der Mensch der Vorzeit*. Written by a devout Catholic, it gave exceptionally conservative estimates of the periods of cultural development; nevertheless, the minimum figure of 50,000 years is given for the time that has elapsed since the appearance of paleolithic man, and the age of the Heidelberg jaw is set at twice that figure.

Prof. Eugen Fischer attacked the important problem of miscegenation in a work on *Die Rassenbastards und das Bastardierungsproblem beim Menschen*, of which he himself summarizes the most important results in *Die Naturwissenschaften*, 1913, p. 1007 et seq. The inter-marriages of Boers and Hottentots studied by Fischer indicate Mendelian inheritance of racial traits. He finds no prepotency of racial types as such, but only of single traits. In point of eye and hair color "dark" is dominant and in hair form "frizzly" predominates over "straight," but the high narrow European nose causes a recession of the low, broad Hottentot organ. Skulls do not tend to produce an intermediate form, in which point Fischer's results confirm Boas's. It is the very fact of Mendelian inheritance that is required, in Fischer's opinion, to prove that given traits are genuinely racial characteristics, otherwise they might be assumed to be effects of environment. Fischer further approaches the problem of the unity of the human species. In favor of unity two arguments are adduced. First, since Mendelian inheritance occurs in man, the human races are probably as closely related as the animal and plant varieties of which the investigation established Mendel's rules, that is to say, the races of man represent but a single species. Secondly, the Hottentot-European breeds display for many generations an unlimited degree of fertility.

In two articles, "Changes in the Bodily Form of Descendants of Immigrants" (*American Anthropologist*, vol. 14, p. 530 ff.) and "Veränderungen der Körperform der Nachkommen von Einwanderern in Amerika" (*Zeitschrift für Ethnologie*, 1913, p. 1 ff.), Professor Boas answers criticisms advanced against his recent investigations. He shows that the number of cases measured and the statistical treatment of the series establish most of the changes as real. A slight instability of types under a new environment thus results beyond question. Boas admits his inability to interpret the observed phenomena, but is able to refute certain explanations advanced by others. More particularly he contends that natural selection does not account for the changes noted, for otherwise we should have to assume most complex relations between mortality and bodily form. It is possible that the change from a rural to an urban mode of life was a determining condition, but this is not yet demonstrated, and even if it were the character of the influence of urban and of rural life is as yet unknown. In short, the fact of a certain degree of racial plasticity (as opposed to permanence) remains, but remains as yet unexplained. In a later article, "The Head Forms of the Italians as In-

fluenced by Heredity and Environment" (*American Anthropologist*, vol. 15, p. 163 ff.), Boas and Miss H. M. Boas, examine Livi's data on the cephalic index found in different parts of Italy and find that "the observations of the city-born population necessitates the assumption, of a direct influence of city life on the cephalic type."

ETHNOLOGY

THEORETICAL WORK. In ethnology, theoretical discussion continued to centre in a relative evaluation of the three principles that purport to explain similarities in distinct tribes,—the psychic unity of mankind, historical contact, and convergence. The last-named concept was borrowed from biological literature by Thilenius and von Luschan, and first clearly defined by Ehrenreich. When two phenomena originally different become similar or identical, they illustrate the process labeled "convergence." Graebner denied (1910) that any similarities could be proved to have resulted by this or any other process of independent development, and explained all similarities by historical contact. Lowie (1912) assailed this position, showing that many of the similarities thus explained by Graebner were superficial analogies, not genuine homologies, erroneously classified together, mainly through ignorance of their psychological setting. On the other hand, Lowie expressed extreme skepticism as to whether genuine resemblances have ever developed by convergence. Laufer indorses the psychological point of view advocated by Boas, Lowie, and other of Graebner's critics, and accepts Lowie's definition of convergence, for which process he furnishes a striking illustration in *Dokumente der indischen Kunst* (Leipzig, 1913). In China painting developed in close connection with calligraphy. As writing was originally nothing but a series of ornaments that were interpreted as symbols, we may therefore say that in China painting originated from decorative art. In ancient India no such course of development existed, for no system of ornamental penmanship existed there. Here physiognomic symbols gave the principal impulse to the development of art. Thus the development of painting in China and India has not followed the same course. There have been two distinct lines of development terminating at points similar in appearance and grouped together under the caption "painting." Goldenweiser attempted to supplement Lowie's treatment in an article on "The Principle of Limited Possibilities in the Development of Culture" (*Journal of American Folk-Lore*, 1913, pp. 259-290). This author defined as genuine convergence "the independent development of psychologically similar cultural traits from dissimilar or less similar sources, in two or more cultural complexes." He argued that both the objective and the psychic aspects of culture are limited in number, thus leading the true convergence. Thus, social divisions regulate marriage, figure as ceremonial units, etc., and often in quite different cultures the same individual functions occur in connection with the same kind of social divisions. Goldenweiser contended that true convergence is of frequent occurrence and that to assume its existence involves fewer hypothetical elements than to assume parallel development; indeed, parallelism itself involves convergence. However, he does

not claim that the principle of convergence by itself adequately accounts for the psychology of the process involved, being in this regard on a level with diffusion and parallelism.

AMERICA. Lowie and Wissler have continued their studies of the military societies of the Plains area. In his *Societies of the Crow, Hidatsa and Mandan Indians* Lowie points out that the Crow societies in question are purely secular clubs, two of which engaged in active rivalry both in war and love, and most of which were alternately called upon to exercise police duties. Unlike other tribes, the Crow did not exact an initiation fee in any of the clubs. The predominant idea was rather that a dead member should be replaced by a relative, who ordinarily instead of paying a fee received gifts to make him join. The Crow societies were not graded in any way and normally membership was for life. Among the Hidatsa and Mandan, oddly enough, there is much correspondence in detail with the Crow conditions, but a complete difference of principle. Entrance into a society is not an individual affair, but occurs in groups; the novices are obliged to purchase their way by a heavy payment, both collective and individual; and the societies are graded in rank, younger groups buying membership in the higher societies from older groups. Though objectively the societies thus come to represent age-grades, the fundamental idea of the system is that of purchase, for whenever for some abnormal cause a man did not buy a new society he kept his membership in the old one indefinitely regardless of age, while a man might also hold membership through purchase in several societies at the same time. The Blackfoot scheme, as described in Wissler's *Societies and Dance Associations of the Blackfoot Indians*, closely resembles that of the Hidatsa. There were no definite age requirements for any one organization, but there was a conventional order for passing from one to another, the change taking place every fourth year. Naturally the Blackfoot apply their general procedure of ceremonial transfer to the acquisition of membership privileges, the regalia of the societies corresponding to medicine bundles. Most interesting is the native theory that the societies were graded in point of their historical antiquity among the Blackfoot, the more recently introduced organizations having been added to the bottom of the series.

Dr. Spinden has published *A Study of Maya Art, Its Subject-Matter and Historical Development*. His most important contribution lies in the determination of the chronological sequence of the Maya monuments and a concordance with Christian chronology. Spinden rejects the suggestion of any ethnic connection between Central America and the Old World based on supposed similarities of culture. He also finds that there is no satisfactory evidence for connecting the pyramids of Central America with those of South America and the Mississippi Valley.

In "A Foreword on the Social Organization of the Creek Indians" (*American Anthropologist*, vol. 14, p. 593 ff.) Dr. Swanton summarized some of his important investigations among the southeastern tribes of the United States. The Creek confederacy was built up of several tribes, the majority of which speak Muskogean languages. Irrespective of language, the towns occupied by the tribes were

grouped into two moieties, which may have been associated with war and peace and always formed the line of cleavage in ball games. Distinct from this dual division is the division of most tribes into exogamous clans, several of which are again linked together in social units of a higher order than may be called "phratries," to which the exogamous rule generally extends. Over and above all these divisions is a tribal grouping of clans in two moieties, which appear in practice games. There are thus at least four distinct modes of grouping among the Creek: The clans, phratries, and moieties within any one tribe of the confederacy, and the dual division of all the tribes of the league.

M. R. Harrington's "A Preliminary Sketch of Lenape Culture" (*American Anthropologist*, vol. 15, p. 208 ff.) refutes a widespread notion that the three large subdivisions of the Lenape were merely geographical in character. They seem, on the contrary, to have been totemic phratries subdivided into many clans bearing nicknames. The clans were strictly exogamous, but it is not certain whether this rule ever applied to the phratries.

Considerable interest has developed in the study of kinship terms. Starting from John P. Harrington's list of Tewa terms, Sapir points out (*American Anthropologist*, vol. 15, p. 132 ff.) that the use of reciprocal terms, that is, of the same term by both members of a pair of related persons, is shared by the Tewa and the linguistically unrelated Shoshonean tribes. This suggests that systems of kinship terms may be correlated with definite geographical areas. On the psychological side of the problem Goldenweiser advances the theory (*ibid.*, p. 288 ff.) that where a term is applied both to relatives by blood and their fellow-clansfolk the meaning of the word was originally limited to the blood-relatives and secondarily extended to include the others. Among the archaeological publications of the year may be mentioned Dr. Fewkes' "Casa Grande, Arizona" (28th *Annual Report Bureau American Ethnology*).

Indian linguistics continue to be cultivated with assiduity by an increasing number of scholars. Professor Uhlenbeck contributes serially notes on the morphology of Blackfoot, and Dr. Josselin de Jong has published a collection of Ojibwa texts, while Dr. Michelson (28th *Annual Report Bureau American Ethnology*) offers a "Preliminary Report on the Linguistic Classification of Algonquian Tribes." The Franciscan Fathers of St. Michaels have issued *A Vocabulary of the Navaho Language*. Through the efforts of the International School of Archaeology at Mexico City order is brought into the classification of Mexican languages, as shown by Meehling's "The Indian Linguistic Stocks of Oaxaco, Mexico" (*American Anthropologist*, vol. 14, p. 642 et seq.). For South America Professor Chamberlain has attempted a similar survey of "Linguistic Stocks of South American Indians, with Distribution Map" (*American Anthropologist*, vol. 15, p. 236 ff.).

OCEANIA. Father Schmidt (*Anthropos*, 1912, 1913) has continued his studies of Australian languages and brought out the important fact that these are not so homogenous as had formerly been supposed and can no longer be grouped together in a single stock. Homogeneity prevails only over the very much larger southern half of Australia, where all languages are united by resemblances of grammar and

vocabulary. From the tribes speaking South Australian tongues there are sharply separated the natives occupying the territory beginning at Roebuck Bay in the west, extending along the 19th and 20th degree south latitude eastward, and terminating at Cape Flattery on the east; only in the centre the North Australian group passes far to the south (28th degree south latitude), including the well-known Arunta (Aranda) tribe. The North Australian languages are again divided into two or three distinct groups, one of which exhibits some similarity with the Papuan dialects of New Guinea. Father Schmidt draws an interesting comparison between his linguistic results and the sociological studies of Graebner. Most students had assumed that in Australia totemism and the dual division of tribes were genetically related phenomena, the current theory being that the two classes had become segmented into four, and sometimes eight, classes, by further subdivision of which there developed the totem groups. Graebner, on the contrary, maintained that totemism and the two-class system are distinct phenomena of which totemism with paternal descent was the earlier to develop in Oceania; that later a two-class system with maternal descent entered the area previously occupied by totemism pure and simple; and that finally, through combination of the two systems, there resulted the phenomena of totemism associated with maternal descent, of totemic divisions grouped in matrimonial classes, and of four-class and eight-class systems. Father Schmidt finds that the linguistic data furnish a curious confirmation of this sociological theory. The tribes with totemic groups speak languages quite distinct from those of tribes with the two-class system, and the purely totemic tribes speak older languages and have been driven into marginal positions. It must be emphasized, however, that these sociological parallels with Father Schmidt's doubtless important linguistic results have not yet been tested and accepted by other scholars.

A noteworthy paper by A. R. Brown entitled "Three Tribes of Western Australia" (*Journal Royal Anthropological Institute*, vol. xliii) tends to revolutionize our conceptions of Australian marriage regulations. These were commonly believed to depend primarily on bars to marriage imposed by the clan, class, and moiety systems regardless of actual relationship. According to Brown the fundamental fact is that a man may marry only a woman bearing to him a certain relation of consanguinity, the class rule being only a special application of this principle. Actual blood relationship, instead of being ignored by the Australians, is of greater importance in their social life than in ours. The kinship system constitutes a system of reciprocal duties and rights, an individual owing the same duties to all the persons to whom he applies the same term. Nevertheless, a difference exists between relatives called by the same term: though a man owes certain duties to his father, his father's brothers, and even distant cousins of his father, there is a clearly felt difference in his attitude toward these several kinsmen,—contrary to a theory long current in anthropological circles.

Thurnwald has published two volumes of his *Forschungen auf den Salomo Inseln und dem Bismarck-Archipel*, dealing mainly with the mythology, songs, and social organization of

the German Solomon Islands. His remarks on the chief's status and on marriage regulations are especially noteworthy. There are three grades of chiefs. Those of the lowest order merely have the right to erect a town-hall, equip it with drums, and use it for the celebration of festivals. Chiefs of the second grade have among their subordinates members of other families than their own, as well as captives whose position resembles that of serfs. The highest chiefs have the right of exiling undesirable tribesmen, but their power is not absolute; they are simply foremost among their peers and do not exercise judicial functions. Marriage is not permitted between members of the same clan, but breach of this custom, though regarded as incest, is punished only by ostracism, condign punishment being left to the ancestral spirits. The clans bear the names of birds. Husband and wife respect each other's birds, both of which are tabooed to them.

AFRICA. A sensational theory was outlined by Frobenius in a semi-popular work entitled *Und Afrika sprach*. Archaeological field research in Yorubaland led this writer to the discovery of a highly developed glass industry, indicating that the glass beads found in such quantities in the Dark Continent may in large measure have been manufactured on the spot instead of being imported from elsewhere, as has been commonly assumed. Equally noteworthy finds are attempts at portraiture in terra cotta and a monolith of triangular section said to have served as a chronometer regulating the period of certain sacred observances. Frobenius believed that the present inhabitants of Yorubaland are much inferior in cultural status to their predecessors on Yoruba soil; and as he finds no evidence of a gradual evolution toward the high-water mark of the ancient culture, he concludes that the old Yoruba culture was an importation from the outside world. Here the most original part of Frobenius's view sets in. Regarding the present system of divination, with relevant cosmological notions, as a remnant of the old culture, he discovers a far-reaching similarity between these customs and the corresponding practices of the ancient Etruscans. To this resemblance others are added, such as methods of burial and especially the type of Yoruba architecture with impluvium courtyards on the Roman style, so that historical contact with ancient Etruria seems established. The next question is, whether the various elements of Etruscan culture reached Yorubaland by an overland route or by way of the Strait of Gibraltar and the western sea route. Frobenius decides in favor of the latter alternative because intermediate stages are lacking in the Sahara and Sudan. This view he supports by documentary evidence that indicates, in his interpretation, often-repeated voyages by the Etruscans along the west coast of Africa. If corroborated by future research, Frobenius's theory will doubtless form a landmark in the study of African culture history.

Some current misconceptions are dispelled in volume i. of Tessmann's *Die Pangoe*. This group of tribes occupies the west coast of Africa, between the 1° south latitude and 5° north latitude, the best-known tribes being the Yaunde in the German Kamerun and the Fan(g) of French Equatorial Africa, while Tessmann's original researches deal largely with the intermediate population in Spanish Guinea. Tess-

mann points out that the Pangwe are quite distinct from the Mpongwe with whom they have been confused. He finds that the view broached by Du Chaillu as to the excessive cannibalism of the Pangwe, which has been uncritically copied by others, rests on the flimsiest evidence. In the north cannibalism seems to be wholly lacking; the central Fang devour the flesh of enemies only, and that in exceptional instances as an act of revenge, while the southern Pangwe practise anthropophagy somewhat more frequently, but not to any great extent. Trilles's theory that the Pangwe have migrated to their present home from the Bahr-el-Gazal district, is neither rejected nor adopted by Tessmann, who himself, however, believes in a migration from the northeast. From this point of view it appears improbable that European influence reached the Pangwe prior to the last decades of the nineteenth century, and accordingly, their cross-bow, in Tessmann's opinion, is not a copy of European models, but an original combination of the native spear and bow type.

For a number of valuable publications we are indebted to the British colonial officials. Of these, Mr. R. Sutherland Battray has published an extensive collection of *Hausa Folk-Lore, Customs, Proverbs*. As the Hausa scribes generally employ not only Arabic script but even the Arabic language to preserve their national records, Battray adopted the novel method of having a scribe translate the manuscripts from Arabic into the Hausa dialect of Kano or Sokoto, and himself transliterated and translated into English. In this connection may also be mentioned the *Anthropological Report on the Ibo-speaking Peoples of Nigeria* by N. W. Thomas, government anthropologist. Another British official, P. Amoury Talbot, has published important data on the Ekoi of Southern Nigeria in his book *In the Shadow of the Bush*, which ably supplements Mansfield's account of those Ekoi residing in German territory. In particular it sheds light on the development of secret societies and clubs that is characteristic of West Africa. The most important of these organizations among the Ekoi is the Egbo (Leopard Club), which has been influenced considerably by the practices of the Efik tribe of Calabar. Even the smallest Ekoi village has its Egbo shed, and the chief of the club is by far the most influential man of the locality. There are no less than seven grades, entrance into some of which is very expensive. In former times, the non-initiated who approached the secret celebrations of the club were promptly executed. Politically and judicially, the Egbo was well-nigh all-powerful; the property of those who owed debts to members was mercilessly confiscated and, if necessary, the debtors were enslaved. But important as is the Egbo, it is only one of a very great number of organizations. Some of these have developed from age-classes, for the men and women respectively who are born within two or three years of one another form distinct age-classes which hold feasts and form self-governing bodies. Several of the clubs carefully guard their secrets from women; thus, no woman is allowed to see the bull-roarers employed by some of the organizations, and the art of stilt-walking is also concealed from the female sex. On the other hand, the women have a very sacred society of their own, during some of whose performances men must keep out of sight.

ASIA. Fay-Cooper Cole has described *The Wild Tribes of Davao District, Mindanao*, with special reference to the Bagobo, who live on the west coast of Davao Gulf, and the Mandaya whose territory extends east of the gulf. Physically, there is great variation within each of the tribes dealt with, which is in part due to intermarriage of the Malays with the aboriginal Negrito population, of which the influence becomes more and more obvious toward the interior. Everything considered, while the individual variation within any one tribe is very great, there is no fundamental difference between any two of the groups taken as units. In addition to this somatic unity there is corresponding dialectic similarity and even greater cultural homogeneity, though local developments in particular directions have taken place. Thus, the Bagobo have specialized in beadwork so as to excel all other natives of the archipelago in this form of art. Some of Mr. Cole's observations are of considerable comparative value and overthrow erroneous beliefs concerning the Davao District natives. Head-hunting for the sake of the trophy is not practised throughout the region, the skull being kept only long enough to prove the murder. Cannibalism does not occur except that warriors eat the livers and hearts of brave men in order to acquire their valor. There is no justification whatsoever for the statement that part of the natives of the district are white. With regard to the iron technique, Cole holds that the art is an ancient one throughout the archipelago, its disuse in some localities being due to various reasons, such as lack of material. In this connection the fact that the process used in northern Luzon is very similar to that of southern Mindanao is of interest.

Drs. Chas. Hose and Wm. McDougall have brought out a monumental treatise on *The Pagan Tribes of Borneo*. Under this head they consider the natives unaffected by Mohammedan influence, whom they group in six stocks,—the Sea Dayaks (or Ibans), Kayans, Kenyahs, Klemantans, Muruts, Punans. Though there is very great diversity of language in Borneo, these peoples conform, on the whole, to a single physical type. All are of moderate height; have nearly black or very dark brown hair, which is generally lank though sometimes wavy or curly; and their skin color ranges from a medium brown to a very pale *café-au-lait* hardly deeper than the color of cream. Mongolian traits appear commonly, though in varying degrees. Culturally the Punans stand lowest, differing from all the rest in their nomadic life and non-agricultural mode of subsistence. They construct rude shelters of sticks and leaves, hunt with blow-pipes, and gather the wild fruits of the jungle. While skilled in basketry, matting, and the preparation of blow-pipes, they obtain most of their other manufactured articles through barter with the other populations. These occupy villages along the river banks and depend for sustenance mainly on the cultivation of rice. In addition they breed pigs and fowls, hunt, and fish. The political organization is loose, except that a chief of powerful personality may rise to ascendancy. Socially, there is a division into an upper, middle, and lower class, the last-mentioned being composed of captives in war and their descendants. There is a strong tendency against marrying outside one's caste, but beyond this there is no restric-

tion in the choice of a wife beyond blood relationship. That is to say, there are no clan divisions, but marriage with a sister, nephew, niece, uncle, or aunt is regarded as incest, and first-cousin marriage is disapproved.

SOCIETIES, MEETINGS. The Bureau of American Ethnology issued its Twenty-eighth Annual Report embodying researches by Drs. Fewkes and Michelson and a bulletin containing the concluding section of Miss Densmore's study of Chippewa music. Dr. Michelson and Dr. Swanton were continuing their investigations of Algonkian languages and Muskogean ethnology respectively. The Peabody Museum (Cambridge, Mass.), equipped an archaeological expedition to Guatemala under the leadership of Messrs. Merwin and Bishop. The American Museum of Natural History continued to support the researches of its staff among the Plains tribes (Drs. Wissler and Lowie) and the Woodland Indians (Mr. Skinner); Dr. Goddard visited the Northern Athapascans of the Peace River country; Dr. Spinden resumed work among the Rio Grande Pueblos, while Mr. Nelson completed his archaeological reconnaissance of the same region and assisted in the exploration of a cave near Puente Viejo, Spain. Under the auspices of the Geological Survey of Canada Dr. Sapir went to the Nootka of British Columbia; Dr. Mason visited the Athapascans north of Lake Athabaska; and Dr. Goldenweiser resumed his investigation of Iroquois sociology. The American Anthropological Association met in New York with the American Folk-Lore Society, December 29 to 31.

ANTIGUA. A presidency (with Barbuda and Redonda) of the Leeward Islands (q.v.). The land is fertile, low-lying, and forestless. Sugar-cane, cotton, and pineapples are cultivated on about 52,414 acres, but cultivation has declined of late years. The output of sugar in 1912 was 11,025 tons (molasses, 5344 punch-tons); in 1911, 11,075 (5380); in 1911, 13,509 (5785). Barbuda raises cattle and in Redonda phosphate of alumina is mined. Trade (external, for calendar years) and finance (for fiscal years) statistics for the presidency follow:

	1908-9	1909-10	1910-11	1911-12
Imports	£175,587	£139,496	£170,033	£181,331
Exports	179,106	114,122	196,184	161,064
Revenue	51,502	48,583	52,326	52,292
Expenditures...	49,964	49,204	53,495	53,652
Shipping *.....	722,862	643,966	644,705	679,048

* Tonnage entered and cleared.

Customs revenue (1911-12), £31,250. Public debt, £123,700. Antigua is under the administration of the governor of the colony. The capital is St. John. See **LEEWARD ISLANDS**.

ANTI-MILITARISM. See **SOCIALISM**, *passim*.

ANTI-VIVISECTION. See **VIVISECTION**.

APTHORP, WILLIAM FOSTER. An American musical critic and author, died February 20, 1913. He was born in Boston in 1848. Most of his youth was spent abroad. He graduated from Harvard College in 1869, and afterwards taught harmony, first in Ryan's National College of Music and later in the New England Conservatory. He was best known, however, as a musical critic. For five years he conducted the musical department of the *Atlantic Monthly*. Two years later, in 1879, his first book, *Hector Berlioz: Selec-*

tions from his Letters and Writings, was published and was well received. For more than twenty years, beginning in 1881, he was musical critic of the *Boston Transcript*. He was editor of the *Cyclopaedia of Music and Musicians*. Among his other published writings are: *Musicians and Music Lovers, By the Way, and The Opera, Past and Present*.

AQUEDUCTS. The year 1913 witnessed the opening of the Los Angeles aqueduct and the advance towards completion of the great Catskill aqueduct for the city of New York. Progress on both of these great engineering enterprises has been described in previous issues of the **YEAR BOOK**.

LOS ANGELES AQUEDUCT. On November 5, 1913, there was dedicated the Los Angeles aqueduct, one of the largest and boldest engineering developments ever constructed for a municipal water supply. This project, which involved the construction of over 200 miles of conduits, tunnels, pipes, and canals, crossing deserts and mountains, was built almost entirely under the direct supervision of the city of Los Angeles, being in charge of William Mulholland, chief engineer, assisted by J. B. Lippincott. With the exception of nine miles of construction of the South Antelope division, two short steel siphons in the Jawbone division, and the commissary and medical departments, which were under contract, the work was done by the city and within the total appropriation of \$24,500,000, voted as a bond issue. In addition the project was carried out within the estimated time, so that the Los Angeles aqueduct stood at its completion as one of the most notable monuments of municipal construction.

Designed to bring daily to the city 265,000,000 gallons of water, there was also involved the utilizing of the surplus waters for the irrigation of 135,000 acres of land near the city and for the future development of 120,000 horse power maximum electric energy. The intake of the new aqueduct is situated 35 miles above the mouth of the Owens River at a height of 3812 feet above sea level, but some 50 miles north of the intake a reservoir has been built at Long Valley to control the flow of the Owens River and the tributary extremes at times of excessive discharge so that the elevation of the maximum water surface is 6810 feet. The reservoir is formed by a dam 160 feet high and 520 feet in length, with a capacity of 340,980 acre feet and a surface area of 8686 acres. The capacity of the reservoir is sufficient to furnish a continuous flow through the aqueduct for 427 days. Further down the valley, six miles above the intake, is the Tinemaha reservoir formed by a dam 40 feet in height, having a capacity of 127,325 acre feet and a surface area of 7074 acres. From the intake the aqueduct for its 24 miles takes the form of an unlined canal with an average depth of 10 feet, a bottom width of 38 feet, a top width of 62 feet and a capacity of 801 sec. feet. This construction was effected by three electric dredges.

At the Alabama foot hills, where the aqueduct passes along the mountain side and passes Owens Lake, the canal is concrete lined, 30 feet in width, 12 feet deep, and extends a distance of 38 miles to the Haiwee reservoir. This reservoir has a surface area of 2100 acres and a capacity of 63,800 acre-feet, being seven miles long and from one-half to one mile in width. The reservoir site had at its centre a summit, so that it was found necessary to divide the reservoir and construct two dams. Its capacity is sufficient to furnish a continuous flow of water for 80 days. The next section consists of about 13 miles of covered conduit, formed of reinforced concrete with the interior plastered to secure the best conditions of flow.

The Little Lake section involves a small amount of covered conduit, 6.73 miles of tunnel and a siphon .272 in length, and next comes the Grape Vine section where there are 7.941 miles of covered conduit, 5.731 miles of tunnel, and 1.360 miles of siphon. The Freeman section is mostly covered conduit amounting to 18.7 miles, while the next section, which passes through the Jaw Bone Canyon, is 7.283 miles of covered conduit, 12.336 miles of tunnel and the remarkable Jaw Bone siphon of 2.589 miles in length. Across the Mojave Desert a covered conduit 28 miles in length is employed, while in the next, or Antelope section, there is covered conduit to the extent of 19.759 miles, tunnel amounting to 3.723 miles and siphon construction totaling 4.719 miles. The Elizabeth section, which includes the Fairmont reservoir and the Elizabeth tunnel 5.09 miles in length, the longest tunnel of the project, and a power waterway of 9.645 miles, leads to the final, or Saugus section, which includes 2.170 miles of covered conduit, 8.990 miles of tunnel, 3.040 miles of siphon and the dry canyon reservoir with a capacity of 1325 acre feet to regulate the fluctuating flow through the power plant. It is formed by a hydraulic fill dam 528 feet in length and 61 feet high.

The Ferando reservoir with a capacity of 23,000 acre feet is about one mile below the south portal of the last tunnel which marks the end of the aqueduct proper and was formed by a hydraulic fill dam which was nearing completion at the end of the year 1913. The completion of the Los Angeles aqueduct came as a very welcome addition to the water facilities of the city which, during the summer of 1913, were taxed to their utmost. The new system provides both for adequate water for domestic use as well as for irrigation and power, so that the future of the city is amply assured in this respect for many years to come.

The accompanying table shows the classification of work on the Los Angeles aqueduct.

Classification	Miles
Unlined canal	23.726
Lined canal	37.054
Covered conduit	97.641
Tunnels	42.903
Siphons	12.052
Flumes	0.165
Haiwee by-pass	2.001
Reservoir	7.870
Power tunnels and waterway.....	9.845

CATSKILL AQUEDUCT. The status of the

work on the Catskill aqueduct at the end of 1913 was substantially as follows: The Olive Bridge dam of the Ashokan reservoir was nearly completed, but somewhat over a year would be required to clean up that reservoir, although during the year water had stayed in it up to a height of 540 feet above sea level, as compared with an elevation of 590 feet for a full water level in the west basin, and at the end of the year it was standing at a height of 510 feet. From the Catskill reservoir to the Croton aqueduct the 92 miles of aqueduct proper was practically completed and the conduit could be made available if needed any time to carry water by gravity into the Croton reservoir, although the end of 1915, or early in 1916, was the date fixed for delivering water to the city through the city pressure tunnels.

As showing the extent of the completion of the aqueduct from the Ashokan reservoir to the New York City line, where the city aqueduct tunnel begins, the following figures of December 31, 1913, regarding the progress, may be given: Cut-and-cover arch, total, 286,336 lineal feet; completed, 286,005 lineal feet; grade-tunnel arch, total, 71,939 lineal feet; completed, 70,906 lineal feet; pressure-tunnel arch, total, 92,740 lineal feet; completed 92,740 lineal feet; steel-pipe siphons, total, 33,066 lineal feet; completed, 33,066 lineal feet. A summary of these results shows that of a total of 484,144 lineal feet of aqueduct between the limits named (which does not include the city tunnel), 482,718 lineal feet had been finished.

As regards the reservoirs, the Hillview reservoir was about three-quarters done and its completion was expected by the end of 1915, while the Kensico reservoir, where was being constructed the vast Kensico dam (see DAMS), was about 40 per cent. completed, and it was expected that a portion of its storage capacity could be used by 1915, although the entire project could not be completed for some five years later. The Silver Lake reservoir on Staten Island was contracted for within the year, and there remained to be contracted for the aqueduct under the Narrows, the pipe line on Staten Island, and a section of steel pipe in Brooklyn. These were to be advertised and contracts awarded in 1914.

The city tunnel which is intended to distribute the water from the Catskill aqueduct from the Hillview reservoir near the Yonkers, N. Y., line, 18 miles in length, was practically completed at the end of the year so that the 110 miles of the aqueduct from the Ashokan dam in the Catskill Mountains to the terminal in Brooklyn, were finished. This tunnel passes from the Hillview reservoir under the Borough of the Bronx, the Harlem River, Manhattan Borough, the East River, to terminal shafts in the Borough of Kings.

Contracts were let in June, 1911, the work being divided into four contract sections, the contracts and their amounts being as follows: Contract 63, diameter of tunnel, 15 feet, distance, 4 miles, \$3,709,372. Contract 65, diameter of tunnel, 15 feet and 14 feet, distance, 5.4 miles, \$5,590,225. Contract 66, diameter of tunnel, 14 feet and 13 feet, distance, 4.4 miles, \$4,512,605. Contract 67, diameter of tunnel, 12 feet and 11 feet, distance, 4 miles, \$5,727,435.

AQUEDUCTS

Open concrete lined ditch above Haiwee Reservoir.

LOS ANGELES AQUEDUCT

The headings of the Catskill aqueduct tunnel under East River, New York City, met on September 27. The meeting of the headings of this important section occurred about 750 feet below the river level and the alignment met within 0.17 feet and the stationing within 0.03 feet. Of the 17½ miles aqueduct from the Hill View reservoir near Yonkers to Atlantic Avenue, Brooklyn, there remained but little to be excavated at the end of the year and it was expected that the last headings between shafts Nos. 8 and 9, in the upper part of Manhattan Island, would meet early in the following January. The city, or distribution tunnel of the Catskill aqueduct was planned in the fall of 1909, and was reported upon by Messrs. Clemens Herschel, Francis L. Pruyn, and J. Edmund Woodman, on May 14, 1910. The scheme was authorized by the board of estimate and apportionment of New York City in July, 1910, and was approved by the State water supply commission in October. The contracts were let and work begun early in 1911. The pressure tunnel under the city, as well as other features of the Catskill aqueduct, was unprecedented in city water-supply distribution systems and its completion promptly and according to the engineers' plans and estimates, was considered a notable engineering achievement.

THE APULIAN AQUEDUCT. An important project in Italy, the Apulian aqueduct, was making substantial progress during the year. Twenty-four and two-tenths miles were added to the length of the main canal, of which 6.6 miles were in tunnel. Progress was also made on the Foggia, Lecce, and Bari branches, and the total work for 1913 was estimated at about 61 miles. The tunneling had been prosecuted under considerable difficulty due to the infiltration of water and this led to a delay in both the long Apennine tunnel and in the Monaco tunnel. On the other hand, the Ginestra tunnel, which passes in part through a volcanic formation encountered emanations of sulphurous hydrogen, but the work was well advanced and but 6.10 of a mile remained out of a total distance of 60 miles. See DAMS, and IRRIGATION.

ARABIA. See TURKEY.

ARBITRATION, INTERNATIONAL. The year 1913 was a quiet one in respect to international arbitration, though in a large measure that fact is due to arbitration itself, for paradoxical though it may seem to be, the more arbitration is developed the less it is likely to be used. Arbitration is not an end in itself, but a means to an end—the pacific settlement of international disputes. The normal method of adjusting disputes is by negotiation, through the usual diplomatic channels. It is only when negotiation fails that arbitration is resorted to as a secondary method to bring about peaceful solution of a question that might otherwise result in war. Arbitration, just because it offers an additional and fair method of settling a dispute, is a logical resort, after negotiations have failed; and the very existence of the additional method encourages negotiators to reach equitable solutions themselves. There is a growing tendency even among nations to settle difficulties out of court, if at all possible.

This condition has been especially manifested in 1913, when probably more difficult questions

between nations were settled peaceably by the disputants themselves than had been previously attempted in a similar period. These twelve months were ones of political turmoil.

Correspondingly more emphasis has been laid upon pacific settlement, with the reduction of emphasis on arbitration itself. The methods of pacific settlement are: Negotiation, good offices, mediation, friendly composition, inquiry by commission and arbitration, which latter will more and more be synonymous with, or succeeded by, judicial settlement. Negotiation is, of course, constantly taking place and is so generally considered a normal method that no review of its accomplishments is necessary, for it takes care of all international differences not referred to the other methods and not resulting in war. Good offices and mediation have been employed by the United States in Mexico and by the great powers of Europe in the Balkan affairs.

Organizations like the World Peace Foundation regard the development of the commission of inquiry, which Secretary Bryan has used in his peace plan, as a great advance toward assured peaceful relations between nations. The commission of inquiry is designed to determine facts about which the nations are in doubt. While arbitration involves an award deciding one disputant to be in the wrong, the commission of inquiry confines itself to finding facts, leaving the settlement of the affair to the disputants themselves. In the Wilson-Bryan peace plan this method, based on the facts that a dispute is a misunderstanding and that where all facts are known there can be no misunderstanding, has been applied to reducing the likelihood of war. The plan simply provides that the contracting parties agree not to declare war before a commission of inquiry has reported on the facts in dispute. It is obvious that the plan has much to commend it; for few wars will be declared after time has been allowed for passions to cool and for the issues to be estimated at their true value.

President Wilson's recommendations are to the effect that: "The parties agree that all questions of whatever character and nature, in dispute between them, shall, when diplomatic efforts fail, be submitted for investigation and report to an international commission (the composition to be agreed upon); and the contracting parties agree not to declare war or begin hostilities until such investigation is made and report submitted.

"The investigation shall be conducted as a matter of course upon the initiative of the commission, without the formality of a request from either party; the report shall be submitted within a time to be agreed upon from the date of the submission of the dispute, but pendently on the subject matter in dispute after the parties shall reserve the right to act inde the report is submitted."

In a supplementary memorandum filed by the Secretary of State he said:

"In the peace plan proposed by the President to all the nations, the composition of the international commission is left to agreement between the parties, and I am authorized to suggest for the consideration of those who are willing to enter into this agreement:

"1. That the International Commission be of five members, to be composed as follows:

One member from each of the contracting countries, to be chosen by the government; one member to be chosen by each of the contracting countries from some other country, and the fifth member of the commission to be agreed upon by the two governments, the commission to be appointed as soon as convenient after the making of the treaty, vacancies to be filled according to the original appointment.

"2. The time also is to be agreed upon, and it is suggested that that time be one year. If a year is considered too long or too short, this government will consider either a greater or a less period.

"3. This government is prepared to consider the question of maintaining the status quo as to military and naval preparation during the period of investigation, if the contracting nation desires to include this, and this government suggests tentatively that the parties agree that there shall be no change in the military and naval programme during this period of investigation unless danger to one of the contracting parties from a third power compels a change in said programme, in which case the party feeling itself menaced by a third power, shall confidently communicate the matter in writing to the other contracting party and it shall thereupon be released from the obligation not to change its military or naval programme, and this release will at the same time operate as a release of the other contracting party. This protects each party from the other in ordinary cases, and yet provides freedom of action in emergencies.

"All of these suggestions, however, are presented for consideration, and not with the intention of imposing any fixed conditions. The principle of investigation being accepted, the details are matters for conference and consideration."

The principles of this peace proposal have been accepted by 21 out of the 39 countries addressed, and actual peace treaties thereon were signed up to December 31, 1913, by seven countries: Salvador, Guatemala, Dominican Republic, Nicaragua, Honduras, Panama, and the Netherlands. At that date active negotiations were under way with Portugal and Denmark.

The nations, in order of their acceptance of the principles involved, are: Italy, Great Britain, France, Brazil, Sweden, Norway, Russia, Peru, Austria, Netherlands, Bolivia, Germany, Argentina, China, Dominican Republic, Guatemala, Haiti, Spain, Portugal, Belgium, and Denmark.

The Hague Court arbitrators selected to settle the controversy between France and Italy, because of the seizure by Italian warships during the war in Tripoli of two French steamers plying between Marseilles and Tunis, announced their decision early in May, the case having been argued on March 31. The members of the court chosen for arbitration were Prof. Louis Renault of France, Prof. Guido Fusinato of the Italian State Council, Prof. de Taube of the Russian State Council, Dr. Kriege, legal adviser of the German minister of foreign affairs, and Hjalmar Hammarskold, governor of the Province of Upsala in Sweden. The two steamers were seized because they had on board an aeroplane and members of the Turkish Red Crescent, whom the Italians thought did not belong to the order, but were

surreptitiously taking in the aeroplane to use in the war. The French government complained of the seizure as a violation of the laws of war regarding neutrals. Italy released the ships and asked for the reference of the question to the Hague Court, to which the French government agreed. The arbitrators have sustained the French contention and agreed that Italy should pay \$400 as damages. The case of no great importance in itself, bears witness to the steady power of the Hague Court in keeping before the world that there is a civilized and rational way of disposing of controversies, now officially recognized by the family of nations, which makes war henceforth without excuse, a fact which is emphasized when one recalls that the case of one of the two vessels (the *Manouba*) was almost the exact counterpart of the *Trent* affair of our Civil War. The one became world-famous as a crisis between friendly nations; but the other, with arbitration to solve it, is practically unknown and involved not even a momentary feeling of ill will between friendly nations. The seizures ceased to be matters of public comment before the steamers in question completed their trips to Tunis and back.

On January 25, 1912, the *Tavignano*, another French vessel, was held up by the Italians under uncertain circumstances of fact, and two Tunisian native vessels were fired upon. Diplomatic discussion immediately brought out misunderstanding as to fact, and under the terms of the Hague Convention a commission of inquiry was appointed. It rendered its report on July 23, 1912. It indicated clearly that questions of law must be settled before damages could be fixed. So it was agreed by a *compromis* of November 8, 1912, to refer these two affairs to the Hague Court for decision on the law and damages. They were scheduled to be considered as the third and fourth parts of the Franco-Italian case. But after the *Carthage* and *Manouba* cases were decided the two governments talked over these other cases and settled them out of court. (See INTERNATIONAL YEAR BOOK for 1912.)

President Nicholas Murray Butler, of Columbia University, and an active member of the Carnegie Peace Foundation, as late as November 27, pointed out there is no visible evidence that any government or any responsible statesman is taking any interest in the preparations for the Third Hague Conference which should be called to meet in 1915. The express recommendations of the Second Hague Conference as to how this work of preparation should be undertaken have not, so far as is known, been followed. "It therefore becomes," he declared at that time, "a very practical and a very pressing question whether those who believe in improved international relations and are working to bring them about propose to let the Third Hague Conference go by default or meet in pursuance of a belated invitation with out a carefully prepared and well thought out programme."

The World Peace Foundation said at the same time if the Third Hague Conference is to meet in 1915, the international committee to prepare its programme should already be in existence. National committees in no way take the place of such a committee. For the creation of this international committee the initiative, if not already taken without the knowledge

of the public, as is entirely unlikely, should be taken immediately by some government. Our own government, the Foundation pointed out, is in a peculiarly propitious position to take the initiative; and the International Peace Congress at The Hague in August properly urged the American peace organization to move in the matter. Some of them have already done so; but there has been no definite and concerted demand. This is the more incumbent as there have been intimations of a purpose or desire in certain influential European quarters to force a delay of the assembling of the conference.

The Peace Palace at the Hague, providing a permanent place for the Hague tribunal, was dedicated in August with appropriate ceremonies.

The World Peace Foundation has published four volumes relating to the Hague Conferences: *Texts of the Peace Conferences at The Hague and American Addresses at the Second Hague Conferences*, both edited by Dr. James Brown Scott; *The First Hague Conference*, by Andrew D. White, and *The Two Hague Conferences* by Prof. William I. Hull; and a considerable list of pamphlets.

Beginning in 1908 the United States arbitration treaties with twenty-five nations running for a period of five years each were negotiated. Nine of these treaties expired by limitation in 1913. The treaty with France was renewed and ratified by the Senate in February. The treaties with Great Britain, Italy, and Spain were renewed and submitted to the Senate, which considered them in executive session on June 5. Objection to ratifying the British treaty was raised by Senator Chamberlain, of Oregon. It is reported that the other two treaties were approved and the action later rescinded to avoid an appearance of partiality. Japan has expressed a willingness to renew her treaty, but Senator Works, of California, is opposed unless arbitration of the Japanese question in his State is excluded. These objections seem likely to prevent early attempts to ratify any of the treaties. Early in 1914 the committee on foreign affairs reported the treaties favorably.

Relief from treaty obligation to arbitrate the Panama tolls issue has endangered several arbitration treaties and the professed leadership of America in the arbitration movement is also believed to be thereby endangered. In the view of many, the United States shirks arbitration when danger of loss thereby is feared. Great Britain objected to certain clauses in the Panama Canal act of August 24, 1912, especially to the exemption of American coastwise traffic from payment of tolls, on the ground that the Hay-Pauncefote Treaty of 1901 provided that "The canal shall be free and open to the vessels of commerce and of war of all nations . . . on terms of entire equality," and suggested arbitration under the treaty of 1908, which stipulated that "questions relating to the interpretation of treaties should be arbitrated." This left the United States three principal choices: 1. To repeal the exemption clause; 2. To arbitrate the issue, under the treaty of 1908; 3. To decline to either repeal or arbitrate. None of these things has been done.

The American-British Claims Commission has held two meetings, one in Washington in May

and one in Ottawa in June. Four cases have been argued and decided, namely, the Hardman, King Robert, Yukon lumber, and Lindesfarne, all British claims against the United States. The first three of these were decided in favor of the United States; in the last, Great Britain recovered a small judgment. Two other cases, the Canadienne, and the Union Bridge Company case, have been argued, but not decided. A re-argument has been ordered in the Union Bridge Company case. One of the most interesting cases to come before the commission is the Studer case, which it is expected will be argued in May next. This is a claim growing out of the destruction of the concessionary rights of an American citizen in the Malay Peninsula.

The claims of the British, French, and German subjects against the Republic of Portugal, growing out of the recent revolution in the latter country, have been submitted to the Hague for settlement. In this connection mention should be made of the shelving of the loan conventions negotiated with Nicaragua and Honduras, by President Taft, and the policy of a new convention by the present administration, extending the Platt amendment over Nicaragua. While these treaties are not arbitration treaties in the technical sense of the word, they were all negotiated with the idea of keeping the peace in Central America.

The Nobel Peace Prize for 1912 was awarded the Hon. Elihu Root, senator of the United States from the State of New York, and that for 1913 to Henry la Fontaine, the Belgian Socialist. As a result of Senator Root's suggestion, while he was serving as Secretary of State, and as a result of his direction and inspiration, the Second Hague Conference adopted the Porter proposition for the limitation of force in the collection of contract debts—the furthest step that the world has yet taken toward the goal of obligatory arbitration—and through his leadership the American delegation was able to create all but the detail of the method of selecting the judges of the judicial arbitration court, to supplement the permanent court at the Hague, created at the first conference. After that conference closed he negotiated the twenty-six arbitration treaties above referred to, the greatest number ever signed at one time by one nation. His handling of the delicate Japanese school question was regarded as a triumph of statesmanship, as was his support of Secretary Hay's open door policy in China. Mr. Root induced the European nations to permit all the American republics to come to the Second Hague Conference, thus making it the first assembly in the annals of history where the whole world came together to discuss affairs common to all. His diplomatic trip in the winter of 1906 to Latin America was a peace mission, and his speeches did much to disarm the prevalent jealousy and suspicion against the United States. One of his greatest achievements is perhaps the little model Central American Court of Justice, which has already twice enjoined the republics from going to war, and has preserved the peace between them to this day.

After Mr. Taft succeeded Mr. Roosevelt, Mr. Root retired from the cabinet and entered the Senate, where he devoted himself to the work of the committee of foreign relations.

In 1910 he served as senior counsel of the United States in the Newfoundland fisheries

dispute with England, argued before the Hague Tribunal. In the same year Mr. Carnegie selected him to be president of the Carnegie endowment for international peace. On the very day that the announcement was made that he had won the Nobel prize, it was published in The Hague that he had been selected as one of the members of the court of arbitration to which are to be referred the claims of British, French, and Spanish subjects in regard to property seized by the Portuguese government after the proclamation of a republic in that country.

The international conference for the consideration of the commemoration of the first century of peace between the United States and the British Empire submitted a report to the national body from which its delegations derive their authority. The report reads as follows:

Platform. The central idea for consideration is not only a programme for the celebration of one hundred years of peace, but a statement of purposes for the perpetuation of peace.

International monuments to be erected in Great Britain, the United States, and their dominions and possessions beyond the seas, the foundation stones to be laid on the selected day, if possible, by His Majesty the King in Great Britain and by the President in the United States, and by their representatives in their respective possessions. In view of the good relations prevailing between the American and British peoples and other nations, all foreign governments should be cordially invited to honor the more important of these occasions by an official representation. At the time fixed for laying the foundation stones there should be a stoppage of five minutes from work throughout all the countries interested, to be occupied, where a public gathering or other assemblage is practicable, by the reading of the agreed inscription on international monuments. At the time fixed, as stated, the work in all schools to be stopped, appropriate addresses to be delivered, and the two national anthems to be sung, followed by a half holiday. A subcommittee should be appointed to ascertain what dates, arrangements, etc., are in the minds of the several countries, with power to determine them and to make them generally known.

The educational features of the celebration comprise an organized endeavor in British-American countries to promote, by well-considered methods, the growth of those feelings of mutual respect and good will which already happily exist. This might include: The endowment of chairs of British-American history with special reference to the peaceful progress and relations of the two peoples and based upon the principle of an interchange of professors, and the endowment of traveling scholarships to enable journalists and writers to visit the various English-speaking countries. The awarding of prizes for essays and some other topics in all schools, colleges, and universities. The coöperation of the respective committees in the preparation of a history of the century of peace, from which text-books and school-books in the several countries may be prepared or revised. An annual peace day celebration in the schools.

Among other features recommended are universal commemorative tablets; universal religious services of thanksgiving; permanent

monuments; cordial approval of the early appointment of a preparatory committee as recommended by the last Hague Conference; celebration in Ghent, after consulting with the municipality; an international commemorative medal.

The conference recommends that an international committee be appointed through action on the part of the national committee, with power to deal with such matters as may be referred to them of the several countries concerned.

The seventeenth conference of the Interparliamentary Union which took place at Geneva just before the Peace Congress, in August, was much smaller than previous conferences. The leaders in the union's work were nearly all there. The papers were of high order, and the members of parliaments present seemed more loyal and devoted than ever before, and determined to carry on their important work in connection with the parliaments of the nations with increased confidence in the ultimate triumph of the special measures which the Union has given itself to promoting.

The Twentieth International Peace Congress was held at The Hague, August 18-23. The organizing head of the congress was, as usual, the International Peace Bureau at Berne (President Albert Gobat; Secretary Henri Golay). Of course there was the usual honorary committee made up in this instance of many of the leading lights of Holland, including T. Heemskerk, minister of the interior; President Schimmelpennick, of the Upper Chamber; A. P. C. van Karnebeek, minister of state, and twenty-four others. The national preparatory committee on organization included about two hundred and fifty others. The members of the general executive committee of twelve members were, however, most directly responsible for the local arrangements. The president of this committee was M. de Pinto. The president of the committee on reception was Jhr. H. W. van Asch van Wijk; the secretary of the committee, H. van der Mandere. There was also a most efficient committee of ladies under the direction of Miss J. Backer.

Differing somewhat from previous congresses, the organization of the programme this year pursued two general lines—the submission of formal papers and the reports of the six committees selected by the bureau. There was a committee on actualities, Professor Th. Ruysen, chairman; on international law, J. G. Alexander, England, chairman; on propaganda, Baron de Neufville, Germany, chairman; on disarmaments, G. H. Perris, England, chairman; on sociology, Dr. E. Giretti, Italy, chairman; and on education, Dr. Emile Arnaud, France, chairman. The formal papers which reached the congress were: "A Report on the Events of the Year Connected with Peace and War," by Mr. Gobat; "The Peace Movement and the Press," by Mr. Fried; "Commercial Rivalry and International Relations," by Norman Angell; "The Enforcement of Sanctions in International Law by Means of an International Police System," by Professor van Vollenhoven; "Economic Sanctions in Case of Violation of International Law," by Mr. A. de Madav; "International Organization of Communications to the Press by Peace Societies," by Mr. Le Fover; "Limitation of Armaments

and Their Gradual Proportional Reduction," by Professor Quidde. These papers and the resolutions submitted by the six committees constituted the basis of the programme.

The Fifth Central American Peace Congress (January), the Twentieth Universal Peace Congress at The Hague (August), *supra*, the Fourth American Peace Congress at St. Louis (May), *supra*, the Interparliamentary Union Conference at The Hague (September), and the dedication of the Palace of Peace at The Hague (August 28) were all notable occasions. Another important meeting was that of the American Bar Association in Montreal (September), at which Lord Haldane, representing the King of England, delivered a notable address, strongly favoring international amity, to a distinguished American audience.

Some important peace agencies recently formed include the Franco-German interparliamentary organization composed of members of the two parliaments, organized to further a better understanding between their nations; a similar organization of members of the Japanese and the United States Congress; and the American Church Peace League, recently organized to supplement the work of the Associated Councils of British and German churches. The secretary of the latter is Dr. Frederick Lynch, 90 Bible House, New York City.

The Year Book for 1912 of the Carnegie Endowment for International Peace contains 165 pages. Beginning with Mr. Carnegie's interesting letter of gift, under date of December 14, 1910, it ends with certain resolutions of the board of trustees, the last of which is a tribute to Albert K. Smiley, under date of December 2, 1912. The book contains the proposed charter, the by-laws, the report of the executive committee to the board of trustees, the report of the secretary to the board of trustees, and extensive reports from the three great divisions of the association, namely, the Division of Intercourse and Education, the Division of Economics and History, and the Division of International Law.

In April the foundation published a report on the teaching of international law in the educational institutions of the United States.

Edwin Ginn, who endowed the World Peace Foundation with a million dollars, died in January, 1914. This organization, which has established permanent headquarters at 40 Mt. Vernon Street, Boston, is managed by a board of trustees consisting of A. Lawrence Lowell, William H. P. Faunce, Joseph Swain, Samuel T. Dutton, Sarah Louise Arnold, Edward Cymming, Samuel W. McCall, George A. Plimpton, George W. Anderson, Samuel B. Capen, Albert E. Pillsbury; and the work carried on by the following directors: Edwin D. Mead, chief director; David Starr Jordan, James A. Macdonald, Hamilton Holt, Charles R. Brown, William I. Hull, George W. Nasmyth, Charles H. Levermore, Albert G. Bryant.

Its pamphlet publications during 1913 were: "The Wounded," by Noel Buxton, M.P.; "Women and War," by M. A. Stobart; "Panama Canal Tolls," by Hon. Elihu Root; "Instructions to American Hague Delegates," 1899 and 1907; Part I, "Washington, Jefferson and Franklin on War," by Edwin D. Mead; Part II, "The International Library;" "The Drain of Armaments," by Arthur W. Allen; Part I, "Organizing the Peace Work," by Edwin Ginn; Part II, "Internationalism Among Universities," by Louis P. Lochner; "The Forces Warring Against War," by Havelock Ellis; "To the Picked Half Million," by William T. Stead; "Our Duty Concerning the Panama Canal Tolls," by Thomas Raeburn White and Charlemagne Tower; "The Commission of Inquiry: The Wilson-Bryan Peace Plan," by Denys P. Myers; "Suggestions for Lectures on International Relations," by Charles R. Levermore; "Work in 1913."

The following table shows the departments already organized by the American Peace Society; the headquarters of each department, the States most canvassed by each, the constituency included, and department directors are given:

Departments	Headquarters	States	Constituency	Directors
1. Central West.....	Chicago.....	Illinois..... Iowa..... Indiana..... Ohio..... Michigan..... Wisconsin.....	20,500,000	C. E. Beals
2. New England.....	Boston.....	New England States.....	6,500,000	J. L. Tryon
3. New York.....	New York City....	New York..... New Jersey.....	11,000,000	S. T. Dutton
4. Pacific Coast.....	Los Angeles.....	Washington..... Oregon..... California.....	4,500,000	Robt. C. Root
5. So. Atlantic States...	Atlanta, Ga.....	Virginia..... Florida..... N. Carolina..... S. Carolina..... Georgia.....	9,280,000	J. J. Hall

The following are the constituent branches of the society, together with the location and number of paid-up members of each:

Society	No. of Members
1. Buffalo Peace Society, Buffalo, N. Y.	115
2. California Peace Society (Northern), Berkeley, Cal.	75
3. California Peace Society (Southern),	
4. Los Angeles, Cal.	310
5. Chicago Peace Society, Chicago, Ill.	462
6. Cincinnati, The Arbitration and Peace Society of, Cincinnati, O.	100
7. Cleveland Peace Society, Cleveland, O.	44
8. Connecticut Peace Society, Hartford, Conn.	245
9. Georgia Peace Society, Atlanta, Ga.	38
10. German-American Peace Society, New York City	91
11. Italian-American Peace Society, New	

York City	42
11. Maine Peace Society, Portland, Me.....	91
12. Maryland Peace Society, Baltimore, Md.....	218
13. Massachusetts Peace Society, Boston, Mass.....	894
14. Missouri Peace Society, St. Louis, Mo.....	107
15. Nebraska Peace Society, Lincoln, Neb.....	216
16. New Hampshire Peace Society, Concord, N. H.....	116
17. New York Peace Society, New York City.....	800
18. North Carolina Peace Society, Raleigh, N. C.....	45
19. Oregon Peace Society, Portland, Ore.....	212
20. Pennsylvania Arbitration and Peace Society, Philadelphia, Pa.....	22
21. Rhode Island Peace Society, Providence, R. I.....	103
22. Utah Peace Society, Salt Lake City, Utah.....	113
23. Vermont Peace Society, Montpelier, Vt.....	73
24. Washington Peace Society, Seattle, Wash.....	
25. Washington (D. C.) Peace Society.....	
26. Wisconsin Peace Society, Madison, Wis.....	
27. Youngstown Peace Society, Youngstown, O.....	

Branch society membership (reported January 1, 1913).....	4532
Other paid-up members.....	1135
Total paid-up members.....	5667

The Fourth American Peace Congress, assembled at St. Louis, May 1 to 4, 1913, recorded its sincere satisfaction at the substantial progress which the movement for world peace has made since the meeting of the Third Congress at Baltimore. It particularly expressed its high appreciation of the unique services to the cause of international arbitration rendered by ex-President Taft in negotiating the treaties with Great Britain and France. Not less significant, the congress recognized the noteworthy enlargement and deepening of public sentiment on the part of nearly all classes throughout the country in favor of pacific settlement of all international controversies. The congress urged upon the President the initiation, at the earliest practicable date, of negotiations for an international agreement for not only the arrest of the current naval and military rivalry, but also of a simultaneous reduction of armaments, that the peoples may be relieved from the heavy and exhausting burdens of taxation under which they are now suffering, and approved the plan which President Wilson and Secretary Bryan had just announced for securing treaties of unrestricted arbitration with not only Great Britain and France, but also with Germany and the other powers, and for the investigation by a commission of inquiry of the facts of any dispute which either of the parties may not consider proper for arbitration before any steps are taken toward hostilities.

The Nineteenth Annual Lake Mohonk Conference on International Arbitration, May 14-16, in view of the probable meeting of a Third Hague Conference in 1915, recommended that the Secretary of State urge the nations which participated in the Second Hague Conference to form immediately the international preparatory committee recommended by it to prepare and submit to the nations a programme for the Third Hague Conference, and to devise a system of organization and procedure for the conference itself, and that the Secretary of State consider the expediency of submitting to the international preparatory committee at an early date a list of the topics which the United

States especially desires to have considered at the Third Hague Conference, with an outline of the proposals of the United States on each topic; and further, that the Third Hague Conference reconsider the question of a general treaty of arbitration which shall, in accordance with the principle of obligatory arbitration unanimously adopted by the second conference, submit to arbitration without restriction disputes of a legal nature, or relating to the interpretation and application of international agreements, and such other controversies as may be considered susceptible of arbitral or judicial determination. It is also urged that the court of arbitral justice, approved in principle by the second conference, be established for the adjudication of disputes of a justifiable nature, without altering the status of the permanent court of arbitration and that the exemption from capture of innocent private property of the enemy on the seas be considered anew by the Third Hague Conference, and further that in general, greater stress be laid by the Third Hague Conference upon the means and measures by which peace may be maintained, or restored when broken, than upon the rules and regulations of warfare.

May 18 was again observed as Peace Day in the schools and the third Sunday in December as Peace Sunday in the churches and Sunday schools. The interest in the observance of these days, especially that of May 18, has increased, and it seems fairly certain that the observance of this anniversary of the opening of the First Hague Conference will be much more general in the schools than before.

The last annual convention of the American School Peace League surpassed any previously held, both in attendance and in the interest aroused. It was held from July 5 to 12, in Salt Lake City, as usual, in connection with the annual convention of the National Education Association. Mrs. Fannie Fern Andrews, Boston, is secretary.

The fourth annual meeting of the American Society for the Judicial Settlement of International Disputes was held in Washington, December 4-6. The subjects discussed were: "Some Preliminary Questions to Be Considered in Connection with the Establishment of an International Tribunal"; "The Nature and Scope of the Different Methods of Peaceful Settlement"; "The Sanction of International Judgments." During the year the following pamphlets were published: "Legal Problems Capable of Settlement by Arbitration," by Charles Cheney Hyde, February, 1913; "Precedent and Codification in International Law," by Paul S. Reinsch, May, 1913; "International Contractual Claims and Their Settlement," by Edwin M. Borchard, August, 1913; "The Supreme Court of the World," by Henry B. F. Macfarland, November, 1913.

The London Chamber of Commerce sent a circular letter in behalf of international arbitration to the leading commercial bodies of the world urging continued earnest action in accordance with the impressive declaration of the International Congress of Chambers of Commerce at Boston in 1912, and asking that the matter be brought before the council to the end that it may be prepared to use its influence in the direction indicated in the resolution adopted by the International Congress.

ARBITRATION AND CONCILIATION, INDUSTRIAL. Recent years have been marked by an unusual amount of unrest among the laboring classes and consequently by numerous strikes and lockouts. There has resulted considerable attention to methods of arbitration and conciliation with a view to preventing the interruption of industry and the attendant losses to business, workers, and the public. As industrial life has become more diversified the increasing division of labor has brought all parts of the industrial system intimately together. The result is that, just as the people of any community are dependent for many of their normal necessities and conveniences upon their local transportation, telephones, lighting, and other public utility corporations, so also have they become more and more dependent upon the more extensive public service corporations such as railways and an increasing variety of industries. Moreover the public is learning that a strike or lockout in any line of manufacturing imposes a greater or less financial burden upon consumers at large, through increased prices, cessation of supply and increased cost of poor-relief. The conviction therefore has grown that some governmental machinery must be established whereby industries vitally important to the public may be continued in operation during the settlement of disputes. In the United States there has not been sufficient public support to warrant the institution of compulsory arbitration, consequently there has been a very considerable development of intervention by State or Federal authorities and reliance upon the enforcement of fair conditions by an informed public.

ERDMAN ACT AMENDED. In their dispute with the firemen the railroads had carried their refusal to arbitrate under the Erdman Act to the very verge of a colossal strike. This act provided that in case of disputes involving common carriers the chairman of the Interstate Commerce Commission and the Commission of Labor should endeavor to settle the differences by mediation; and that if they failed the carrier and the employes should each choose a representative and these two a third to constitute a board of arbitration whose award should be binding. The roads preferred a larger arbitration board because the responsibility imposed by the act upon the third member, who represented the public, was too great to impose on one man. They objected that the act operated only to compromise disputes and not to settle a controversy in a judicial manner. Thus expediency and coercion replaced justice. They also put forth the plea that under the act the interests of the public were not safeguarded since the unions have no responsibility except to their own members. Press comment also brought forth the objection that arbitrators should not be chosen because of their obvious bias; and that the awards under the act merely brought temporary peace, usually for one year.

When, therefore, the country was threatened by a strike of railway conductors and trainmen, as noted below, the Newlands bill was rushed through Congress in July creating a commissioner of mediation and conciliation, who, with two other government officials, shall constitute a board of mediation and conciliation. An assistant commissioner was authorized. The

new law provided for arbitration, when desired, by six instead of three arbitrators, two representing the roads, two the employes, and two chosen by these four. Both the roads and the railway unions coöperated in formulating and pushing this revision through Congress. President Wilson appointed to the board the following: William L. Chambers, commissioner; Assistant Secretary of Labor Louis F. Post; and Judge Martin A. Knapp of the Commerce Court. Mr. G. W. W. Hanger was selected as assistant to the commissioner.

ATTITUDE OF ORGANIZED LABOR. During the year there were numerous objections from labor leaders to any compulsion in the matter of arbitration or conciliation. American trade unionists, as represented by the American Federation of Labor, have uniformly stood out vigorously against the New Zealand scheme of compulsory judicial settlement of trade differences. Since the enactment of the Canadian trades disputes act, and especially with the growth of sentiment in the United States favoring some form of compulsion at least in public utilities, they have raised objections even to the mild form of compulsion embodied in that act. Under that law neither strike nor lockout may be instituted before the whole situation has been subjected to review by an impartial board and the findings published. The trade unionists object that the delay thus involved makes quick and effective strikes impossible, because in the interim strike breakers can be secured. Moreover, they argue, experience shows the efficiency of a well-organized system of collective bargaining with trade agreements that include provision for conciliatory measures. They do not agree with the fundamental postulate of the Canadian law that public opinion is disinterested and certain to demand and enforce justice. Finally they object that the law interferes with personal freedom by denying right to withhold labor power, that is, to strike, at one's own pleasure.

CLOAK INDUSTRY. The protocol by which the great strike of 1910 in the cloak, suit, and skirt industry of New York was settled proved to be an effective form of arbitration. It provided for a grievance committee of five unionists and five employers to which disputes could be taken by employer or employes and from which appeals could be taken to a permanent board of arbitration. This latter board was composed of three distinguished and public-spirited men, Louis S. Brandeis, a Boston attorney, Hamilton Holt, editor of *The Independent*, and Morris Hillquit, a leading Socialist. The agreement provided for the preferential union shop, that is, one in which preference is given to union members but from which non-unionists are not excluded. But the notable feature of this protocol was the creation of a board of joint sanitary control of seven members, two representing the union, two the employers, and three the public. The three latter have been: William J. Schieffelin, chairman of the Citizens' Union; Lillian S. Wald, of the Nurses' Settlement, and Henry Moskowitz of the Madison House. This board has wrought a revolution in the lighting, ventilation, cleanliness, and safety of the 1888 shops under its survey. It has secured drop ladders for fire escapes, doors opening outward, dressing rooms, scientific lighting and numerous other

standard conditions. It has issued certificates to those shops meeting its sanitary standards, and by February, 1913, practically every shop of the Manufacturers' Association had such a certificate. The board also instituted a regular programme of educating the employees regarding factory laws and conditions of health.

The remarkable results of this arrangement suggested its extension to other industries; and it was made the basis of settlement in a strike in three other branches of the garment industry. See *Needle Trades* under **STRIKES AND LOCKOUTS**. It requires a strong union and a strong employers' association, both directed by men of conscience and public spirit. It recognizes the rightful interest of the public in the creation of goods which the public must buy; and by thus opening the way for the reforms demanded by the National Consumers' League it makes possible the standardization not only of all the conditions of labor and production but of the products themselves.

RAILWAY FIREMEN. In May, 1912, the 31,000 firemen of the fifty-odd Eastern railroads presented to their managers demands for increased pay, new rules as to hours and overtime, and for extra firemen on large engines. They expressed a willingness to arbitrate under the Erdman Act, but the roads preferred a board of seven such as had settled the engineers' case in 1912. Tension increased until by February 18, 1913, a strike appeared almost inevitable, 96 per cent. of the men having voted to quit work. This would have been a national calamity, since the roads involved had 67,000 miles of main track, served nearly 40,000,000 people, and handled nearly one-half of the total traffic of the country. On that day it was agreed to submit differences to three arbitrators under the Erdman Act. This concession by the roads was secured by Judge Knapp of the Commerce Court and Acting Commissioner of Labor G. W. W. Hanger. The arbitrators chosen were Vice-President W. W. Atterbury of the Pennsylvania Railroad, Vice-President Albert Phillips of the Brotherhood of Locomotive Firemen and Enginemen, with Judge W. L. Chambers of Washington as chairman. They made the following award to take effect May 4, 1913: An increase of wages less than demanded; a refusal of the request for two firemen on certain engines, but provision for the arbitration of specific requests for two firemen; helpers in electric service to have same conditions as those on steam railways; firemen in pusher, helper, mine-run, belt-line, wreck, and transfer services to have same rates as those in through-freight service; the working day to be ten hours or a run of 100 miles or less. The firemen had demanded an increase of wages estimated by them to be 15 per cent. and by managers to be 35 per cent.; the increase granted was variously estimated to equal 6 to 12 per cent. and to entail on the roads an annual increase of from \$2,500,000 to \$4,500,000. The firemen abandoned their demand for over-time pay at time and one-half before the case was submitted to arbitration.

RAILWAY CONDUCTORS AND TRAINMEN. Perhaps the most notable award of the year was that of the board of arbitration organized under the Newlands act to settle the demand of the conductors and trainmen of the fifty-odd rail-

roads east of Chicago and north of the Ohio and Potomac rivers. The men, including 19,903 conductors, and 53,363 trainmen, demanded an increase of 21 per cent. in wages and certain new rules regarding conditions of employment. The board of arbitration consisted of Seth Low, ex-mayor of New York, and Dr. John H. Tinley, New York State commissioner of education, representing the public, two railroad vice-presidents, and two railway unionists. They held hearings from September 11 to October 10; and made public their award on November 10. Decision was rendered by a vote of four to two. They granted increases in wages of about 7 per cent., amounting in the aggregate to about \$6,000,000 per year. The board held that the basis of increase should be the rise in the cost of living since 1910, when an adjustment of wages had been made. The principle of guaranteeing a certain minimum daily and monthly pay was adopted. Thus conductors with runs of less than 155 miles were guaranteed at least \$4.50 per day; assistant conductors, \$3.75; baggage-men, \$2.75; flagmen, \$2.60; and brakemen, \$2.55. The monthly guarantees were thirty times as great. The board refused to grant the demand for overtime pay at time and a half, and the demand for time and a half and double time pay for work on trains hauled by two or more engines. The board held that it could not make the higher rates of pay in the West the basis of its award, but it suggested the advisability of an inquiry by a government commission as to reasons why, if any, rates of pay should be higher in the West and Southeast than in the East. The board held the railroads to constitute a national public utility, like the Post Office, and expressed the opinion that ultimately the railroads would be forced to conform to the government practice of no differential. The award held that all standardization should be up and never down, that is, that wherever pay or conditions were already better than those of the award they should be unaffected by the decision. The board considered this the final stage in a cycle of wage adjustment and hinted strongly that higher railroad rates would be necessary to meet these new demands and the urgent needs for new equipment and other improvements. The decision had an adverse effect upon many railway stocks. This was due in part to the fact that, in spite of the investment of new capital, railway earnings were actually less than in 1912; and in part to the acceptance of the contention of the arbitrators representing the railroads that the unions would soon come forward with new demands, since in the light of recent decisions, they had no chance of losing any of their gains and had some chance of bettering their conditions. Railroad executives voiced the opinion that the Interstate Commerce Commission, having power to fix railroad rates, should also have power to adjust wages so as to bring the two into conformity. In any case the railway managers found some slight comfort in the award because it furnished, in their minds, a final convincing reason why their demand for a 5 per cent. increase in rates should be granted.

LITTLE FALLS. The strike begun in the knitting mills of Little Falls early in October, 1912, was brought to a close early in the year

through the intervention of the New York Bureau of Arbitration. This strike developed features comparable to the great Lawrence strike at Lawrence, Mass., in 1912, partly as a result of Socialist and I. W. W. leadership. Like that memorable strike it was due to a threatened reduction of ten per cent. in wages made necessary by the law limiting the hours of women to 54 per week. Investigation by the Bureau of Labor Statistics showed that in September, 1912, about 49 per cent. of the male employes had received \$9 per week or less; that about the same proportion of women had received \$7.50 or less; that 10 per cent. of the men and 30 per cent. of the women had received \$6 or less a week. The bureau's report characterized the housing and living conditions as poor and declared that "the one outstanding and unavoidable conclusion of this report is that there is need of a thorough general investigation of wages and cost of living among the textile workers of the Mohawk Valley."

GREAT BRITAIN. The development of means for effecting the settlement of trade disputes by conciliation and arbitration has gone on rapidly in Great Britain in recent years. In 1896 the board of trade was authorized to act as a permanent agency of mediation. In 1908 the permanent Court of Arbitration was created. Then in 1911, as a result of unusually extensive and stubborn labor contests there was created the Industrial Council. This consisted in 1913 of thirteen representatives of employers and an equal number of representatives of workmen, under the chairmanship of Sir George Askwith. It holds regular meetings in February, June, and November of each year.

At the beginning of the year there were 297 voluntary conciliation boards and standing joint committees in existence, of which 282 dealt with special trades and 15 dealt with districts or entire industries. More than a hundred of the trade agreements under which these boards and committees existed provided that in case of failure the dispute should be submitted to an umpire, arbitrator, or conciliator to be appointed by the board of trade. Similarly they frequently provided that questions of interpretation shall be referred to the board of trade.

At the request of the government the Industrial Council submitted a report in July on the question of the best method of securing the fulfillment of trade agreements and how far such agreements should be enforced throughout a trade or district. The council held 38 meetings before drawing up its conclusions. Its report declared emphatically that the maintenance of the principle of collective bargaining should not be called in question. Inquiry showed that collective agreements are kept as a rule, the exception being in unorganized or only partially organized trades. The report suggested that provision be made in all trade agreements for submission of disputes to a third party in case of failure of the established machinery; and that pending such decision no strike or lockout be declared. As to the question of enforcement, the council did not favor either money penalties or the prohibition by law of financial or other assistance to persons impeached; but it advised the withholding of such financial assistance

and the exertion of moral influence in favor of strict adherence to the contract. It did not view compulsory arbitration with favor. While it thought there is real danger that effective agreements cannot be maintained where there are many employers and workmen in the trade outside of the agreement, yet it favored the development of methods which would extend the operations of the agreement to all parts of the industry. It recommended that every trade agreement provide that a certain number of days' notice must be given by either party of an intended change affecting wages or hours; and that there should be no stoppage of work or alteration of the conditions of employment until investigation has been made by some agreed tribunal and its pronouncement made.

SWITZERLAND. Very early in January Basel passed a law establishing a permanent board of arbitration of three non-partisan members. The law contained a clause making appearance of employers and employes before the board compulsory. It also provided that before a strike or lockout could be declared the matters in dispute must be submitted to review by the arbitration board. This principle was adopted from the Canadian trades disputes investigation act. A board similar to that created in Basel already existed in Zurich and succeeded in settling about three-fourths of all cases brought before it. The Zurich law provided that an award should become effective only when accepted by both sides; and that surety might be exacted from both sides for the faithful execution of the award.

ARCHAEOLOGICAL INSTITUTE OF AMERICA. See **ARCHAEOLOGY**.

ARCHAEOLOGY. The past season has witnessed a consistent advance in the field of archaeology. Most of the old sites have been worked, so that in certain places the excavations have come to a close, while in others there is still much to do. As will be seen the Germans have carried on their explorations at Babylon with their usual thoroughness and Professor Butler has done equally brilliant work at the important site of Sardis, Italy, particularly the Palatine Hill in Rome, has proved to be an exhaustless source for the archaeologist; the north, however—France, Germany, and England—has not yielded as much as in past years.

MESOPOTAMIA. Assur, which has occupied the Germans for so many years, is still being explored. Last winter found the workmen engaged in uncovering the graves in the ancient cemetery, from which satisfactory results have been obtained. The tombs proved to be of large size laid up in well dressed stone that might do credit to any modern cemetery. These tombs were not found outside the city walls as is usually the case, but within so that they could be protected from desecration at the hands of an enemy. From this it would seem that they were destined for the royalty or nobility. In form the monuments are rectangular and enclose a chamber about four by eight feet. At one end and raised from the ground is a stone door which still can be turned in its sockets. The sides of the tombs are about ten feet in height and are used to support an arched roof. At El Ahmer, eighty miles south of Bagdad and a short distance from the river

Euphrates, the Abbé Genouillac has laid bare the ruins of the primitive city of Kiss, which is older than Babylon and in fact one of the oldest capitals of Babylonia. In the middle of the great courtyard of the palace this scholar discovered the remains of a very high tower which was called the "Temple of the Foundation of Heaven and Earth." This monument was sacred to the national god Zamama, and the Abbé Genouillac believes that in it he has the source of the Biblical legend of the tower of Babel, which was intended to reach from the earth to the heavens. Statuettes and vases found among the ruins show that the monument cannot be later than the time of Hammurabi.

While the work of the Germans under Koldewy at Babylon has produced nothing spectacular this year, it marks the movement ever nearer to the complete clearing of the site—at which the excavators have been at work for the last fifteen years. What has been brought to light is that part of the city connected with the name of Nebuchadnezzar II. It is now possible to follow the Sacred Way which led from the Ishtar Gate to the temple of Bel. The gate with its beautiful decoration of enamelled brick representing bulls, griffins, and unicorns, as well as the temple itself belong to the sixth century B.C. The older city of Hammurabi has not yet been found—probably owing to the fact that it lies on some other part of the site. On the site of the temple of Bel the Germans have dug a deep pit at the bottom of which they have laid bare great arches which possibly may have supported the famous "hanging gardens" of legend. Beneath the houses in the city have been uncovered a number of graves showing the practice of burying within the city limits. This was probably for some religious purpose.

An interesting discovery has been made in one of the tablets from Nippur and now in the possession of the University of Pennsylvania. The tablet in question, which dates about 2100 B.C., gives an account of the creation and the flood. According to this source a female divinity, Nintu by name, "created the black-headed (that is, human) race" . . . "the fields of the ground produced abundance, the cattle and the four-legged beasts of the field artfully they (the gods) called into existence." After this the narrative goes on to say that the gods became angered at mankind for some wickedness and that "at that time Nintu wailed like a woman in travail. The holy Ishtar wailed on account of the people. Enki (the god of wisdom) held counsel with Anu and Nintu over the proposed destruction of man. At this time Zingidda was king and high priest of Shurappak (which means 'the city of the last day of the flood') and he bowed before the gods and prayed, prostrating himself in humility, and daily and personally he was in contact with them by means of dreams, and he conjured them daily by the name of heaven and earth." Then comes a description of "windstorms which possess great power, the rainstorms in their entirety went with them, and the storms were terrible. After seven days the rainstorm had stormed over the land and carried away the huge boat. Then the sun-god came forth shedding light over heaven and earth. Zingidda opened the

(roof) of his ship and the light of the sun-god was let into the interior of the huge boat." When the storm had passed and the waters had subsided Zingidda prayed to the gods and sacrificed an ox and a sheep—apparently in answer to his prayers Enki and Nintu were able to persuade the gods to cease from their wrath. Zingidda himself is translated to an island in the Persian Gulf, where he lives in a kind of paradise.

SYRIA AND PALESTINE. At Ain Shems, a mound on the main road from Jerusalem to the sea, Mackenzie and Newton have, they believe, uncovered the remains of Beth-She-mesh. The walls of the city have been laid bare. A mass of ashes which covered them leads to the supposition that they were destroyed by the Assyrian invasion of 701 B.C. Near by a road which crossed the mound in antiquity, is the shrine of Abu Meizar, which Newton thinks marks the spot where the ark rested on its arrival from Ekron, for a description of the site well fits in with the account in Samuel vi. 14.

At Baalbek, where the Germans have been occupied for the past four years, much has been accomplished in the way of clearing up the site and strengthening the weak places. At Beth Jibrin in Palestine is reported the discovery of a painted rock-cut tomb antedating the Christian era. The monument has places for two adult burials and two smaller ones probably for the interment of children. The central decoration of the tomb consists of a cross surrounded by a wreath and of bunches of grapes. According to Mackenzie, a natural section of the sea-threatened Askalon exhibits ten strata which he classes as pre-Semitic, early Canaanite, Canaanite, a burnt layer, Philistine, Crusader, and late Arabic. In the lowest stratum—the next to the bed rock—have been found fragments of pottery which possibly may date as far back as 2000 B.C. At this time the city seems to have had no wall. From the third, or Canaanite, stratum came a piece of an alabaster vase apparently of Egyptian manufacture and dating from the eighteenth dynasty or later. At Jerusalem excavations have been conducted on the site of the ruins bearing the name of Qsar Jâlad. These ruins are generally believed to mark the site of the tower Psephinus which is described in Josephus and stood at the northwest corner of the city of Jerusalem.

EGYPT. Recent excavations have brought to light traces of a colony of pre-dynastic dwellers on the site of Abydos. Only a few inches below the sand was found a thick stratum mingled with remains of burnt wood, potsherds, animals' bones, and decaying vegetable matter. Among other finds were two hearths, about twenty inches in diameter, which were buried in ashes that contained also arrowheads, borers, scrapers, knives, and saws, as well as a small copper chisel. Besides these finds the excavators ran into a primitive furnace containing twenty-three jars, arranged twelve and eleven and, later on, another crowded with thirty-seven jars. The vessels were held in position by means of fire-bars of clay. Over the furnaces had been originally a roof, and the walls still showed the stoke holes. The furnaces had been heated by means of twigs which were burned between the jars. From the fact

that charred remains of grain were found in the jars it is clear that the furnaces were employed for parching the wheat or rye used. On the same site was discovered a fourth dynasty cemetery, in which most of the tombs had never been violated. They consisted usually of small brick buildings two feet in height and as a rule six feet square with a small enclosure on the eastern side. The actual grave was below. Tombs of the twelfth dynasty also came to light. In one of these was found a necklace of amethysts four feet in length. At Gizeh the expedition sent out by the Museum of Fine Arts, Boston, and Harvard University has opened many tombs of importance on the acropolis. Among these is that of Sessem-Nofer, which is one of the original series of mastabas. Its walls are standing almost to the roof and exhibit some fine sculptures in relief. Near to the tomb of Sessem-Nofer was found a smaller mastaba, that of Ka-Nofer. This, together with a relief representing a procession of dancing girls, taken from a nearby tomb, have been acquired by the Museum of Fine Arts in Boston. During the past two winters Quibell's work at Memphis has resulted in the uncovering in a small part of the cemetery of more than four hundred burials. These are uniform in character and for the most part belong to the second and third dynasties. The burial chamber was in the form of a house complete as possible—even to the extent of a bathroom—so that the dead might have all the comforts to which he had been accustomed in life. The tombs had in many cases been previously rifled, but the excavators were still able to recover a number of bowls and dishes and a draught board. Some of the vases bore the names of kings, thus affording a dating for the cemetery. At Meroë Garstang found in the northeastern part of the city a postern gate and what in all probability was a stairway which led up to the ramparts. In this same quarter of the city was also discovered the remains of a Roman bath equipped with a stone bathtub of modern form, and its heating apparatus. To the southwest the royal baths came to light, with their *frigidarium* and *tepidarium* which were furnished with ornamental seats. The swimming pool was about six feet in depth, and decorated with glazed tiles and sculptures between the water spouts. Above were frescoes. Several statues, including one which resembles the "Nile" of the Vatican, were recovered from the building. The original structure dates from the second or third century and was rebuilt a century later. All the sculptures are of local execution. The buildings of the city fall chronologically into three periods—(1) from 700 B.C. to 300 B.C., when Egyptian influence was paramount; (2) from 300 B.C. to 100 A.D., the time of Greek influence and (3) from 100 A.D. to 700 A.D., when Roman influence was felt. The city itself was destroyed somewhere about 700 A.D. The expedition of Harvard University and the Boston Museum of Fine Arts has discovered a pre-dynastic cemetery at Mesheikh. The bodies were placed in the tombs in contracted positions, wrapped in mats or leathern garments and adorned with necklaces of shell, stones, primitive figures of animals, etc.

The work of the Metropolitan Museum this year at Thebes in the concession of Assasif

was concerned with the attempt to find the valley temple of Mentuhotip and the causeway which led from it to the great temple next to Halshepsut's at Deit El Bahari. The avenue was found to be ninety meters wide and ornamented on either side by a row of trees. Curiously enough, in order to insure the growth of the trees holes nearly thirty feet in depth were cut in the solid rock and filled with loam in which the stumps of the trees were still found in some places. When the length of the avenue, three-quarters of a mile, is borne in mind, the tremendous energy of the builders is at once appreciated. During the season a Ptolemaic cemetery, and a mortuary temple of the later Rameside kings of the twentieth dynasty, were found.

ASIA MINOR. At Ephesos the recent work of excavation has been confined to the examination of the "Double Church." The earliest plan seems to belong to a building which may be the one referred to in a number of inscriptions as the "Museum." This season at Didyma has seen the clearing of the mass of ruins which have covered the cella since the temple collapsed in the fifteenth century. Many new blocks of the frieze of griffins have been recovered. At Pergamon the Germans have completed their excavations to the east of the Gymnasium. A large building, dating from the time of the kings, has been discovered, as well as three earlier rock-cut cisterns and a building of the same period containing a circular hall and a hypocaust that had been added later.

The excavations of the Americans at Sardis under the direction of Professor Butler have been of great importance from the point of view of the history of art and of epigraphy. The digging about the temple of Artemis last year left the building more or less as if in a trench. This season's campaign has extended the excavation in all directions so that now the temple stands in the midst of an open space. During the course of this work foundations of houses on different levels were uncovered to the northwest. These belonged to different periods. To the north foundations of poor construction were encountered at high levels of Roman date, and in addition a massive structure built of Roman concrete with thick walls and buttresses. To the east of the temple the workmen met with a precipitous mass of hard-packed earth, which is thought to be a great piece of the acropolis which probably slipped down at the time of the earthquake of the year 17 A.D., and after being redistributed at that time packed down again into its original hard condition. This was found not over 100 feet distant from the front of the temple. Since this obstruction precluded any further digging in that direction this year, attention was devoted to the clearing on the south where traces of walls and a Byzantine cemetery were laid bare. The excavations showed fairly consistently that the lower levels were marked by Lydian pottery, the next by Greek coins, and the upper levels by Roman and Byzantine pottery. It is possible that the temple of Zeus, which Butler hoped to find this year, may be concealed beneath the building of Roman concrete mentioned above as lying to the northeast of the temple. Toward the end of the season a row of foundations and

bases of monuments was uncovered extending northward from the north side of the temple in the direction of the great high-road running east and west. It is possible that this belongs to the Sacred Way, and if so it would mark the western side of a wide road running from the middle of the temple on its narrower side. At this point an important bi-lingual inscription in Lydian and Greek, and two lions and an eagle (originally placed upon one pedestal) were discovered. Another important sculptural find from the northern edge of the Roman city consists of a sarcophagus of the Sidamara type. In the tombs of the old acropolis were found several hundred pieces of pottery, among which were many specimens of Lydian pottery of the sixth century B.C. and earlier. Among other objects recovered from these tombs were an ivory head of very archaic character, a small number of masks and figurines of the archaic and later periods, and bronze mirrors in some instances furnished with ivory handles. Particularly interesting were a number of very beautiful gold necklaces, small ornaments, and rings set with carnelian scarabs or furnished with gold seals. The most interesting find of all in the tombs consists of a set of plaques and rosette of repoussé work. These came from one burial. There are six larger plaques, each decorated with two seated, human-headed lions, with beards and wings, placed face to face and supporting a winged disk of Egyptian character—the whole design being framed in bands decorated with rosettes and crested battlements, Assyrian in style. The nine smaller plaques are decorated with a design in the form of a walking sphinx. There are over forty rosettes and these are furnished with shanks at the back like buttons. The workmanship of the whole series is so fine that it shows up better when seen through a magnifying glass.

GREECE. Although the Balkan War doubtless had much effect on archaeological investigation in Greece, still much was accomplished by the Greek authorities. In Athens the Greeks have resumed the excavation of the Stoa of the Giants, which has not been touched since 1871. The eastern end has been found and the building has been shown to be rectangular in form and surrounded by a wall. In its midst were the three giants with snake bodies on bases belonging to later times. Later evidences have been uncovered which suggest that the eastern part of the building was used for a dyeing establishment. Crete again this year has been the scene of much activity. The famous Idæan cave just above the village of Kamarais was thoroughly examined and much pottery of the Middle Minoan period was brought to light. At Knossos, Evans (now Sir Arthur Evans) has carried on supplementary excavations for the purpose of clearing up certain questions connected with the stratification. In the "Queen's Megaron" two earlier pavements built on different systems came to light under the one previously known, and the same results were obtained from excavations in the region of the Olive Press and in the Eastern Magazines and the West Central Court. In this quarter it is now clear that the Egyptian monument of Abnub belongs to the second Middle Minoan period. Particularly interesting was the discovery of the "Keep" of the earliest palace. At Gortyna the Italians have

completed the excavation of the Nymphæum in the vicinity of the Pythium. This building, dating from imperial times, was restored in Byzantine days. Work on the "Prætorium" or "Basilica," which lies to the eastward of the temple of Apollo, has resulted in a number of interesting inscriptions in honor of magistrates of the province of Crete and Cyrene. To the north of the temple of Apollo was discovered a sanctuary of Isis dating from Plavian times. The building which bore the great Gortyn inscription has now been demonstrated to be an Odeum adapted by the Romans from an older circular structure. In the region between the north side of the palace and the "agora" at Haghia Triada, Halbherr uncovered a large court which adjoined the Late Minoan I. palace. Beneath it was discovered remains of houses belonging to the time of transition from the Early to the Middle Minoan periods. To the southeast of the palace was found a chapel of the Late Minoan III. period. At Tylissos the Greeks have found a third building lying to the north of the palace, the walls of which in many places stand to the height of about six feet. The house had a long corridor, which was crossed by others at right angles. Traces of a light shaft and a window were found and three double flights of stairs leading to the upper story. Directly under this house were Early Minoan walls.

At Pagasæ in northern Greece thirty more painted gravestones have been recovered from the second of the three towers on the wall that were discovered last. Near this tower a beautiful marble head of the goddess Pasikrata was found in her temple. At Thermon seven houses with foundations of unhewn stone show a culture comparable to that of the prehistoric villages of Olympia, Eretria, and Ægina. The large elliptical building beneath the temple has been excavated so that now it can be made out to be an elongated ellipse divided into pronaos, cella, and apse. Thus, in the second millennium B.C., we find a forerunner of the apsidal temple such as the Boulenterion at Olympia. One of the most interesting discoveries on this site is that the great temple, instead of having the normal number of two pediments, had only one and a pent roof substituted for the other. At Chrysovitza, near Thermon, has been found a series of reliefs representing a sacred feast at which a fat divinity reclines. Excavations carried on this year in Cephallenia to establish the identity of the island with the Homeric Ithaca have not been productive of results. At Corfu the work of clearing the temple of Garitza has been continued. At Thebes work was confined to the western court of the Mycæan palace.

At Tiryns the German Institute has cleared up the approach from the lower stronghold to the upper inside of the eastern circuit wall, and the relations between the earlier and the later palace have been studied by means of trial pits. It is now certain that the plan of the later palace was a new one and that the introduction of the large megaron was a new feature. Underneath the remains of the Byzantine church to the south of the great outer court were discovered some chambers which are related to the later palace. The most important results from this year's work at Tiryns came from pits sunk in the women's megaron.

Several definite strata were exposed, of which the lowest showed remains of a curved building. In the four from the bottom were recovered a mass of vase fragments corresponding to those of the shaft graves at Mycenæ. The possibility of determining the nature of the building on the lower level is rather remote, owing to the superposition of the later palace. It has also been found that the altar in the great inner court was originally circular in form and not a trench for sacrifices. In the megaron the base which Schliemann erroneously designated as a "basin" is now known to be a support for the throne. The earlier palace is now dated in the Late Minoan I. or Late Minoan II. period; the later palace in the Late Minoan III. period. In the Argolio, the site of Oinæ has been located to the south of Karyia, at modern Zenghalatio. At Elis slight remains have come to light. A submerged island has this year been located near the island of Lemnos. The archaeologists sent by the Greek government have identified it as the island of Chryseis. The time of its sinking was the beginning of the second century of our era.

AFRICA. Near Bengazi a small Greek marble of Praxitelean style has been discovered.

ITALY. One of the most interesting discoveries of the year in Italy has been that of what seems certainly to be Horace's villa. Although many sites have been given for the famous Sabine farm of Horace, excavations have been carried on for some time at the foot of Mt. Lucretilis at Licenza. As a result of two years' work by Pasqui in this place the details of the villa have been pretty clearly made out. The building is rectangular in form and entirely surrounded by a double wall, of which the outer part was designed to resist landslides from Mt. Lucretilis and to protect the garden on the side toward the river. The garden itself occupies some four-fifths of the villa and is still enclosed by a colonnade. In the centre of the garden is a large pool six feet deep and lined with blue tiles, which apparently was used for bathing purposes or as a fish pond. The villa proper is approached from the garden by a few broad steps and it is sheltered from the heat of the summer sun by a portico. The internal arrangements of the villa are such that the right half of the building was occupied by Horace and his guests, while the other was given over to the servants. In the owner's quarters were found several bedrooms and a large dining-room decorated with marble mosaics in the style of the Augustan period. In the servants' quarters was found the *coldarium*, or hot bath, for men and women. The discovery of beautifully sculptured marbles in the *débris* covering the building leads to the supposition that the estate was not as mean as one might judge from Horace's writings. The villa has unfortunately suffered much by the building of public baths here in the time of Vespasian, and in our own time by the removal of stone by the priest of Licenza in 1857 in order to build the church of this town. Lombardic and Gothic remains have also been found here.

At Monte Cavo a second-century cemetery has yielded a gladiator clad in iron armor. At Ostia, in the excavation of the nortico behind the theatre, the mosaics of three more corporations have come to light. These are the *navi-*

cularii misuensis, the *navicularii* of Hippo Diarrhytus, and of Misluvium in Mauritania. On the Via dei Vigili a large room has been excavated and a mosaic pavement brought to light representing four dolphins flanked by symbolic designations of the provinces with which Ostia had most intercourse, namely, Sicily, Africa, Spain, and Egypt. In Rome much has been accomplished. Between the peribolus of the Baths of Caracalla and the baths themselves, the excavators have discovered a *xystrus*. Among the finds made on this site are a copy of a Polyclitan bronze, and the upper portion of a head copied from the "Hermes Propylaios" of Alcámenes. A library with niches for *amaria* and *imagines* was also uncovered. Under the basilica of the Flavian Palace, Boni has discovered two narrow staircases which lead to a *piscina*, which was a reservoir of five divisions. This reservoir is still complete, even to its water-tight cement coating, in spite of the fact that it was built in the time of Nero, who used it to preserve rare sea fish for his table. Also on the Palatine a house of imperial times has been opened. Inscriptions, together with other evidence lead to the belief that it was the residence of Tiberius Cæsar and Julia, the daughter of Augustus. The equipment, which was luxurious, included a large bathtub and hot and cold water supplies. Another, and perhaps more interesting, discovery in this quarter is that of Nero's revolving dining-room. In searching for the machine-room Boni found three vertical shafts, one of which was over one hundred and twenty feet deep. Nearby was also found a tank with a chamber twenty by sixty feet, twenty feet below it. In the latter were stones with cogs on a horizontal bed. This is thought to have been the "machine"-room. Particularly interesting was the discovery under the Palace of Domitian of frescoes representing the landing of Helen of Troy. In the basement was discovered parts of an imperial throne. By descending through a hall in the centre of the atrium access was given to beautifully plastered galleries. At Sutri, near Rome, a peasant found in his field a very beautiful bronze figure of a youth doing up his hair. It is but two feet seven inches in height. The workmanship is Græco-Roman, but it goes back in type to some Praxitelean model of the fourth century.

On the east side of the "Street of Abundance" in Pompeii, at the crossing of the roads which run between *insulæ* vi. and vii. of *regio* i. and *insulæ* vii. and xi. of *regio* ix., the excavators discovered a shrine in which were frescoes representing in a frieze the *Dei Consentes* or *Penates Publici* of Pompeii. These as they follow the frescoes are Jupiter, Juno, Mars, Minerva, Hercules, Venus, Mercury, Proserpina, Vulcan, Ares, Apollo, and Diana. On one side of the shrine is a painting depicting a sacrifice by *vici*, *magistri*, and *ministri vici*, et *compiti*, while an inscription gives the names of four members of the *collegium compiti* for a year not much before 79 A. D. The street between *insulæ* vi. and vii. was found to have been closed by a wooden door, while three blocks of tufa sufficed to prevent the passage of vehicles. Many election notices were found near by, and at least in one instance the writer felt inspired to fall into verse. The terror of the last days of the city has once more been

brought home to us by the finding, just outside the Porta Nolana, of the body of a man lying on his back, with legs raised and hands clasping a branch, as if, in his desperation, he had climbed a tree in his efforts to escape, but, overcome by the fumes, had fallen, tearing away the branch as he fell. A second-story dining-room has been found which has several interesting features. The front of the room overhung the street, while below it were two passages, of which one led by a staircase to the dining-room, while the other led to a shop. At one end of the dining-room fragments of drinking-vessels for birds were found, suggesting that this part of the room was used as an aviary.

GERMANY. At Eberswalde, near Berlin, a clay vessel a few inches deep was found in which were seventy-eight objects of massive gold, such as drinking-cups, rings, etc. It is possible that these are Phœnician objects which came to Germany by way of the Baltic.

ARCHITECTS, AMERICAN INSTITUTE OF, NEW ORLEANS CONVENTION OF. See **ARCHITECTURE.**

ARCHITECTURE. In this field the year 1913 has no specially noteworthy achievement to record. The total volume of building to its credit appeared to have been below rather than above the average of recent years. The disastrous Balkan wars not only put a stop to architectural activity in the regions directly affected, but disturbed the balances of capital in the great financial centres of Europe, vastly increasing the burdens of taxation in France, Germany, and Austria by provoking a tremendous increase in armaments. In the United States capital showed itself unusually timid regarding new enterprises, especially in the East. Never since the great strikes and lock-outs of the building trades in 1903-1904 has the volume of building fallen so low in New York City, where many architects either practically closed their offices or reduced their drafting-room forces to a mere skeleton of the usual staff. In the West, particularly on the Pacific Coast, the falling off was much less noticeable.

A detailed account of buildings begun or completed in the various countries of the world during the year 1913 is impracticable, because of the incompleteness of the records of contemporary work in the architectural journals as the *YEAR BOOK* goes to press. Owing, moreover, to their frequent failure to date the buildings they illustrate or describe, the compiler of this article cannot claim chronological accuracy as to the works hereinafter listed. They are all, however, recent works, though some may have been completed before 1913, and doubtless not a few important buildings of the year have been left out of the account.

THE UNITED STATES AND CANADA. The most interesting and yet disappointing architectural event of the year was the negative result of the important competition for the gigantic Court House to be erected on the proposed new civic centre in New York. The winner of the competition, which was admirably conducted, was Mr. Guy Lowell, of Boston, whose extraordinary design for a vast circular edifice provided in a remarkably ingenious and skillful way accommodation for the fifty-four courts required to be housed therein. Unfortunately the Su-

preme Court justices, whose approval had been stipulated as necessary to the final adoption and execution of the jury's award, rejected the design absolutely and dismissed the architect, with the solatium of the specified forfeit to be paid him for non-employment. The entire project was thus thrown back to where it was two years before, if not indefinitely postponed.

The most important edifice completed in 1913 was the new Grand Central railway terminal in New York (Warren and Wetmore). While this hardly rivals in size, cost, or scale the colossal Pennsylvania Station (see *YEAR BOOK* for 1911), it is a magnificent edifice, remarkable especially for its concourse and waiting-room and the admirable arrangement of its many tracks on two levels. It is the dominant feature of an imposing group of buildings surrounding a grand plaza extending to the north, which includes the new Biltmore Hotel, completed at the very close of the year.

For the great Cathedral of St. John the Divine in the same city a new chapel in Renaissance style, by Carrère and Hastings, was nearly completed, and the adjoining diocesan buildings—Choir School, Deanery, and Synodal Hall, all three by R. A. Cram, the present diocesan architect—were completed and occupied. Later, Mr. Cram's designs for the completion of the cathedral (nave, transepts, and crossing) were exhibited and provoked much discussion. Of at least equal importance was the completion of the new St. Thomas's Church on Fifth Avenue, by Cram, Goodhue, and Ferguson; the only stone-vaulted church in New York, if not in the United States, and a distinctly notable achievement in the French Gothic style. Several other churches, by Goodhue, Ludlow, and Peabody, and others, were begun or completed in various versions of the Gothic styles, illustrating the growing vogue of the modern Gothic revival. Among public buildings the new Municipal Offices Building in New York, by McKim, Mead, and White, under construction for four years, was completed and in part occupied. It stood conspicuously first in size, beauty, and importance. (See **ARCHITECTURE, YEAR BOOK, 1909.**) The fine new Post Office by the same firm, on Eighth Avenue, opposite the Pennsylvania Station, was completed, though the old downtown Post Office was not wholly discontinued. The same architects were also the designers of the new School of Journalism and the Fernald Hall Dormitory of Columbia University.

The *Maine Monument*, commemorating the sinking of the *Maine* in Havana Harbor on February 24, 1898, was not quite completed on the fifteenth anniversary of that event, but was unveiled somewhat later. It stands at the entrance to Central Park, and is the joint work of H. V. Magonigle, architect, and A. Piccinilli, sculptor.

In the field of commercial architecture the most important item in New York was the beginning of work on the new Equitable Building, on the site of the building burned in 1911. It will cover the largest area of any one commercial structure in New York, and will be a "skyscraper," though not competing with the Woolworth and Singer buildings. The multiplication of loft buildings and hotels continued, though not on the scale of recent years. It was observable that matt-glazed white terra-

cotta was increasingly used for the exteriors of loft buildings, not always with highly artistic results. Gothic details, freely treated, seem also to find increasing favor in commercial architecture.

Outside of New York the most important architectural enterprise on foot was the Panama-Pacific Exposition at San Francisco. Owing no doubt to the overdoing of expositions in recent years, it had attracted less attention than it deserved, at least in the too self-centred East. It was to be arranged on the group plan around distinctive courts (e.g. "Court of the Four Seasons," by H. Bacon, of New York; "Court of Flowers," by G. W. Kilham, of Boston, etc.), and to be adorned by an "Echo Tower," by L. C. Mullgardt. The architecture was to be highly ornate, lacking somewhat in the unity of effect hitherto sought in recent expositions.

Among the most important of recent buildings at Chicago was the Hotel Blackstone, the largest and finest of a number of new hotels opened during the year in the Middle West and South.

Architecture seemed to have been fairly prosperous on the Pacific Coast. Early in the year Los Angeles was reporting permits for new buildings at the rate of 40 per day, including one for the erection of a huge family hotel, the Casa del Carmine Real, with 900 rooms. The disastrous tornado at Omaha, which wrecked 642 houses and damaged over 1600 others, was followed by an energetic rebuilding. Fargo, N. D., reported an unusual architectural activity—a bank, several stores, an auditorium, and an opera house being among the new enterprises. At Seattle the L. C. Smith building, a 42-story skyscraper which had been two years in building, was completed near the end of the year. It is a tower somewhat of the New York type, and was probably the tallest building west of the Rocky Mountains.

In the South there was probably a normal activity, especially in hotel building, exemplified by the Wade Hampton, begun at Charleston, to cost a million dollars, the Georgian Terrace at Atlanta, by W. L. Stoddart, and many others. Charleston also announced the beginning of a costly yacht club building; but in general the Southern architecture was not rully reported in the professional journals.

In the national capital the year witnessed the completion of the fine new city Post Office, a marble structure near the Union Railway Station, and of the Scottish Rite Masonic Temple, by J. R. Pope. From Boston the most important items were the completion and opening of the huge Copley Plaza Hotel, by H. J. Hardenbergh, near Trinity Church, and the completion of the Perkins Institution for the Blind, a group of Gothic buildings by R. C. Sturgis. In Albany the important competition for a new Court House was won by Hoppin and Koen, of New York.

The colleges and universities have had about the usual amount of additions to their buildings. The most important was the completion of the extensive and impressive group for the Graduate School of Princeton University, by Cram, Goodhue, and Ferguson, a vast quadrangle with dormitories, class-rooms, seminars, library, director's residence, and Cleveland Memorial Tower, on a commanding site a mile from the rest of the university. At Cincinnati the He-

brew Union College, by A. L. Fechheimer; at Vassar College a new students' building, by McKim, Mead, and White; at Cornell new residential halls, by Day Brothers and Klauder; and at West Point progress on the buildings of the Military Academy, are among other educational buildings reported. Architectural improvements connected with city planning are reported under that title.

THE AMERICAN INSTITUTE OF ARCHITECTS at its recent convention at New Orleans reorganized its administrative offices, elected R. Clipston Sturgis, of Boston, president, and D. Knickerbocker Boyd, of Philadelphia, secretary; and without reaching a final decision discussed at considerable length three important questions: The establishment of a national bureau or department of fine arts; the adoption of the English system of quantity surveying, and a new basis for the schedule of professional charges. All these questions are attracting much attention in the United States at present.

CANADA. Aside from the usual activity there was reported an important competition for a city hall for Winnipeg, Manitoba, to cost \$3,000,000, and the erection of a building for the Imperial Bank of Canada, also at Winnipeg, by Darling and Pearson. The same architects were also the designers of the new Convocation Hall for Toronto University. The commission for some new buildings for the University of Manitoba was awarded to local architects in Winnipeg. This university established a department of agriculture, under the charge of Professor A. A. Stoughton, of New York. At Regina (Sask.), a large hotel and railway station was begun.

EUROPE. In Great Britain there was considerable building for educational institutions. Among new edifices of this class begun or completed were: An elementary teachers' training college at Hull (Crouch, Butler, and Savage); a diocesan college at Galway, Ireland, by W. A. Scott; a new technical institute at Cardiff, Wales, by Jones and Thomas; at Glasgow a new training college, by Honeyman, Keppie, and Mackintosh; at Birmingham a group of buildings for the Bluecoat School, by M. O. Type; and at Cambridge an interesting new quadrangle for Cheshunt College, by H. Grayson. From London the most important items appeared to be the beginning of work on Sir Aston Webb's new façade for Buckingham Palace; the advancement of work on the Marylebone Town Hall, the County Council Building, the vast group of King's College Hospital at Denmark Hill, by W. A. Pite; the completion of a building for the School of Architecture of University College, the new Middlesex Guildhall in Westminster, by Gibson, Skipworth, and Gordon; and a new building for the Institute of Civil Engineers, in neo-classic style, by J. Miller. Liverpool began the erection of a new tuberculosis hospital and continued work on the cathedral; Devonport selected a design for a new municipal building, by Ashley and Newman; Glasgow initiated a project for extensive additions to the municipal building; and Manchester began the erection of a new theatre by Farquhar, Richardson, and Gill.

Architectural education was being rapidly developed in England. During 1913 the department of architecture of Sheffield University was transferred from the faculty of applied sci-

ence to that of fine arts (following thus the example of Columbia in 1904); the two schools of University College and King's College at London were consolidated and housed in the new building of University College previously mentioned; Cambridge University, following also the example of Columbia, authorized the acceptance of two years of architectural studies as counting towards the degree of bachelor of arts; and the first "atelier" after the Beaux-Arts fashion was established, with Arthur Davis as "patron."

In the field of historic architecture much concern was aroused in London by the precarious condition of two famous buildings. St. Paul's Cathedral was found to be seriously menaced by the settling of its foundations, owing to the draining away of subterranean water by various excavations near by (a result which has also in New Orleans, following the completion of the new sewerage system of that city, caused the settling of the foundations of the old cathedral, which was in great danger therefrom). The superb timber ceiling of Westminster Hall was found to be riddled with worm-holes, though perfectly sound not many years ago, and the collapse of that precious mediæval construction (1399-1495) was feared to be imminent. Extensive excavations at Old Sarum, near Salisbury, have uncovered the ruins of William the Conqueror's fortress, and of Bishop Oswald's church—the original cathedral of the diocese. The establishment of a ministry of fine arts has been actively discussed during the year. The question of the registration of architects, also vigorously agitated, has made little progress.

In Germany there was about the usual activity in the same lines as in recent years, and the same tendencies manifested themselves. The "Moderne Kunst" produced, among many very eccentric and bizarre edifices, some excellent department stores and warehouses; e.g. the Iietz Wahrenhaus at Hamburg, by Cremer and Wolfenstein; while a new museum for Königgratz displayed this movement in its most virulent form. Many new townhalls were begun or completed, among them those for Landsberg, Iietz, Lembach, and Dübels; a *hauptarchiv* (hall of records) for Schwerin; a Cinema theater of considerable importance for Charlottenburg (Berlin), by Oskar Kaufmann; and plans were adopted for a group of buildings for the Düsseldorf Art Academy, by Wach and Beck. Among the best works, as usual, were those of an industrial or utilitarian character, like the fine new Bismarck Bridge at Saarbrück, and a number of excellent factory buildings. The work of town-planning, especially of new garden-suburbs of large cities, continued with very varied results; in many cases an excellent layout was vitiated by the ugliness or monotony of the houses designed for it. The German architects seemed to find it hard to occupy the middle ground between innocuous mediocrity and a wholly eccentric and extreme originality of design. This was conspicuous in the drawings exhibited in the recent great Jubiläums Kunstausstellung at Berlin.

Considerable excitement was aroused by the interference of the Kaiser in the award of the competition for the new embassy to be built at Washington. The designs submitted were of indifferent merit; the prize was awarded to

Bruno Möhring for a design which was so unacceptable to the Kaiser that he ignored the jury's award and gave the commission outright to the court architect, Herr von Shue. This action, deplorable from the point of view of professional ethics, will doubtless result to the advantage of the architecture of Washington.

There was much activity in Austria, both in Vienna and Budapest, and in the smaller cities. The veteran Otto Wagner was the architect of the new Lupus Hospital at Vienna; the Wiener Bankverein erected a fine "palace" by Gotthief and Neumann, and Karl Hoffmann was the architect of the great new Kaiser Franz Josef Museum at Vienna. At Budapest, besides the huge new Imperial Palace, an imposing block of buildings not hitherto reported, we note a Reformed church, by Achay Alabar, and the new Hungarian Merchants' Union, by Bela Lajta, marked by the extreme eccentric ugliness of which that architect is an unrivaled master.

From France is reported a large volume of official architecture in Paris, Bordeaux, Versailles, Nancy, and many smaller cities—hospitals, asylums, town halls, schools, etc. The most important building of the year at Paris was the Théâtre des Champs Elysées, by Bonvard and Vandeveld, whose singularly stiff and unsympathetic lines, *art nouveau* disregard of all traditional forms, and inharmonious decoration excited much heated controversy. Additional wings for contagious diseases have been built at the Hôpital St. Joseph, of a straightforward and pleasing architecture, by P. André. Competitions have been held for cheap tenement-house blocks, and projects actively discussed for the layout of encircling suburbs at and near the site of the present fortifications. At Bordeaux a vast block of handsome barracks was completed for the *gendarmérie*, by M. Gervais; at Villejuif an extensive asylum for the aged, by J. Mouze, and plans prepared for suburbs for Nancy and Dunkerque (Belgium).

In Belgium interest centred in the exposition at Ghent, and the improvements in that city in connection therewith, including the completion of the Post Office. The exposition buildings were in the main by O. Van de Voorde; the Colonial Palace by M. Caluwaerts.

From other parts of the world available reports have been meagre. In India the Town Planning Commission, consisting of Capt. G. S. C. Swinton, J. A. Brodie, and the architect, S. Lutyens, charged with the selection of a site for the new capital at Delhi, have adopted finally the so-called northern site, south and southwest of the present city, near the Jumna, placing the government centre on Raisina Hill. The controversy as to architectural style still continued, but was likely to eventuate in a group of neo-classic buildings. In South Africa the erection of important buildings continued at Cape Town, Pretoria, and other cities; notably the Union Buildings, by Herbert Baker, on Menjeskop at Pretoria (railroad station, post office, hemicycle, etc.), and the cathedral at Uganda, by Beresford Pite. A great public library was erected at Melbourne, Australia (Bates, Peebles, and Smart), with the largest concrete dome as yet attempted anywhere, 124 feet 6 inches in span.

From other countries the records available

have been too fragmentary to permit of mention.

NECROLOGY. The losses to the architectural profession by death have been notable: In France, Constant Moyaux, architect of many buildings, including the new *Cœur des Comptes* at Paris; in England, John Belcher, best known in America as collaborator in Belcher and Macartney's *The Later Renaissance Architecture of England*; in Germany, Heine Schneider, a distinguished specialist in hospital architecture; in the United States, L. de C. Bergh, W. P. P. Longfellow, and the veteran George B. Post, besides many others of lesser note. See **NECROLOGY**, also **FOUNDATIONS**.

ARC LAMPS. See **ELECTRIC LIGHTING**.

ARCTIC EXPLORATIONS. See **POLAR EXPLORATION**.

ARGENTINA. A federal republic of South America. The capital is Buenos Aires, co-extensive with the Federal District.

AREA AND POPULATION. Argentina consists of fourteen provinces, ten territories, and the Federal District. The area is known only approximately; a recent planimetric calculation places it at 2,806,400 square kilometers (1,083,551 square miles). Another calculation, made at the geographical institute of the University of La Plata, places the area at 2,789,462 square kilometers (1,077,011 square miles). The last general census (1895) returned 3,954,911 inhabitants (exclusive of an estimated 90,000 not enumerated); an estimate of the total population, December 31, 1910, was 7,121,822 (of whom some 30,000 uncivilized Indians).

It is clear that the number of inhabitants is not known even approximately; for an estimate of December 31, 1912, reported as official, placed it at 8,700,000. An increase of nearly 1,580,000 in two years is not plausible. In the provinces, the greatest density is in Tucumán, reported at 13 per sq. km. in 1910; Santa Fé, 7; Buenos Aires and Entre Ríos, each 6; Corrientes, 4.7; Córdoba, 3.5. The city of Buenos Aires, with an area of about 72 square miles, had an estimated population of 1,444,082 on April 1, 1913. Other cities, with recent estimates of population, are: Rosario, 220,000; La Plata, 99,766; Córdoba, about 100,000; Avelaneda, 87,000; Tucumán, 78,695; Bahía Blanca, 72,706; Mendoza, 60,000; Santa Fé, 48,600; Salta, 40,000; Paraná, 35,857; Corrientes, 30,000.

In the period of 1857-1911, immigrants by sea numbered 3,924,952, and emigrants 1,156,871. Of the immigrants, 2,052,925 were Italians, 1,132,460 Spaniards, 201,732 French, and 115,827 Russians. In 1910 immigrants and emigrants numbered 289,640 and 97,854, respectively; in 1911, 225,772 and 120,709. Immigrants in 1912 numbered 323,403, of whom 165,662 were Spaniards, 80,583 Italians, 20,832 Russians, and 19,792 subjects of Turkey. The government encourages immigration, but advises all newcomers to go to the rural districts, where agricultural labor is in demand, rather than remain in the cities, especially Buenos Aires, where they are not needed and where prices are excessive.

EDUCATION. In 1911 about 45 per cent. of the children of school age were in attendance, and of these only about 13 per cent. could read and write. About 50 per cent. of the inhabitants over six years old are illiterate. In 1911

the reported number of primary schools (public and private) was 7183, with 22,456 teachers and 746,725 pupils. For secondary education the government maintains 27 national colleges (10,227 students). There are 62 normal schools (about 6000 students) and some 20 schools for special and technical instruction. Higher and professional instruction is provided by the three national universities at Buenos Aires, La Plata, and Córdoba and provincial universities at Santa Fé and Paraná (total students, over 7300, the majority of whom being at Buenos Aires).

INDUSTRIES. The prosperity of Argentina is due to its agriculture and stock-raising; of these, agriculture in recent years has made the more notable progress and continually forces the grazing industry farther from the large centres of population. There is little mining. Milling and meat-packing are large industries. The area under cultivation in the year 1911-12 was about 21,884,000 hectares, or 1,109,000 hectares more than in the preceding year. The area under alfalfa was 5,955,000 hectares. The following are other important crops, with area in thousands of hectares, production in metric quintals, and yield per hectare in 1911-12:

	Hectares		Quintals		
	1911-12	1912-13	1911-12	1912-13	Qs. ha.
Wheat...	6,897	6,918	45,230,000	54,000,000	6.6
Oats.....	1,031	1,192	10,040,000	16,820,000	9.7
Corn.....	3,422	3,830	75,150,000	50,000,000	22.0
Flaxseed.	1,630	1,733	5,724,000	11,300,000	3.5

In 1911-12 the alfalfa crop was 4,038,320 metric tons; raw sugar, 180,800 tons; wine, 3,876,369 hectoliters. The total estimated value of agricultural (and forestal) crops in 1911-12 was 672,912,190 pesos gold; of this amount 230,320,367 pesos was credited to the province of Buenos Aires, 138,187,150 to Santa Fé, 100,324,570 to Córdoba, 38,846,037 to Mendoza, 33,438,940 to Entre Ríos, and 30,839,380 to Tucumán. Livestock (estimate of December 31, 1911): 28,786,168 cattle, 8,894,031 horses, 534,813 mules, 319,315 asses, 67,383,952 sheep, 4,301,955 goats, 2,900,000 swine. As a sheep-raising country, Argentina ranks second, Australia being first, the number of sheep in 1910 is stated at 67,383,952. The value of stock-raising products in 1911-12 was estimated at 394,917,922 pesos gold, of which 183,319,391 pesos was credited to Buenos Aires province, 46,961,095 to Entre Ríos, 35,875,753 to Córdoba, 35,034,437 to Santa Fé, and 19,371,037 to Corrientes.

COMMERCE. In 1912 imports and exports were valued at 384,853,469 and 480,391,256 pesos gold, exclusive of coin and bullion. Par value of the peso is 96.447 cents. Imports and exports of merchandise have been as follows, in thousands of pesos gold:

	1902	1907	1910	1911	1912
Imports....	103,039	285,861	351,771	366,811	384,853
Exports....	179,487	296,204	372,626	324,698	480,391

Imports and exports of coin and bullion have been: 1909, 67,454,000 and 1,247,000 pesos; 1910, 37,028,000 and 1,670,000; 1911, 12,764,000 and 3,009,000; 1912, 36,078,000 and 586,000. Principal classified imports in 1911 and 1912,

In thousands of pesos gold: Textiles and manufactures thereof, 69,698 and 78,370; iron and steel and manufactures thereof, 43,086 and 45,998; earthenware, earthen, stone, coal, etc., 33,202 and 33,617; vehicles and railway equipment, 36,865 and 32,799; building materials, 33,789 and 31,265; food products, 29,337 and 30,140; oil, grease, etc., 15,890 and 18,446; wines, liquors, and other beverages, 13,799 and 14,677; metals and manufactures thereof (other than iron and steel), 15,480 and 14,367; chemicals, drugs, etc., 12,178 and 14,281; agricultural implements and machinery, 13,692 and 12,552; timber, woods, straw, and manufactures thereof, 10,401 and 9888; paper and manufactures thereof, 8670 and 9867; electrical apparatus, 6683 and 9309; tobacco, 5892 and 7594. Subdivision of textile import in 1912: Cotton, 38,138; wool, 14,374; silk, 6548; other, 19,310. Iron and steel in 1912: Primary and relatively primary material, 22,343; manufactures, 23,655. Value (in thousands of pesos) of the largest specific imports in 1912: Coal, 25,956; colored woven prints, 10,690; sackings, 8658; pitch pine, 8461; machinery, 6986; galvanized iron, 6384.

Argentine exports are classified under six heads, as follows (in thousands of pesos):

	1909	1910	1911	1912
Agricultural	230,504	196,582	139,764	278,187
Pastoral	153,548	161,007	168,395	188,216
Forest	8,927	10,565	12,255	8,983
Fish and game...	752	1,429	1,663	2,008
Mineral	743	540	565	285
Miscellaneous	2,876	2,505	2,055	2,712
Total	397,351	372,625	324,698	480,391

Classified agricultural exports in 1911 and 1912, in thousands of pesos: Primary products, 129,711 and 264,495; elaborated products, 4828 and 7135; by-products, 5225 and 6556;—classified pastoral exports: Ordinary animal products, 137,383 and 155,028; elaborated animal products, 17,640 and 19,780; live animals, 9460 and 10,965; by-products, 3911 and 2443. The meat export (including livestock) of Argentina increased from 6,684,945 pesos gold in 1885 to 56,502,816 in 1912; in 1903 the export of the four principal agricultural products—wheat, corn, linseed, and oats—was 96,224,509 pesos, and in 1912 262,815,449. The development of the leading exports is shown below, in thousands of pesos:

	1902	1910	1911	1912
Corn	22,994	60,261	2,767	108,908
Wheat	18,585	72,202	80,675	97,835
Wool	45,811	58,848	50,494	58,149
Cowhides	15,167	30,711	34,440	42,130
Frozen and chilled beef	7,002	25,371	31,283	34,285
Linseed	17,841	44,604	33,580	34,214
Oats	503	8,143	11,666	21,859
Rendered tallow and grease	6,209	9,537	11,768	11,315
Cattle	2,848	4,056	8,201	9,140
Sheepskins	8,487	8,624	7,761	8,520
Wheat flour	1,604	4,947	4,739	6,926
Bran	1,727	4,522	4,612	5,941
Frozen mutton.....	6,406	6,008	6,873	5,614
Quebracho extract..	910	4,429	4,980	4,837
Quebracho logs.....	2,477	5,604	6,897	3,569
Horse hair	1,065	1,335	1,582	2,111
Canned meat.....	164	1,215	1,541	1,770
Butter	1,278	1,151	558	1,471
Goatskins	1,116	1,313	1,284	1,461
Whale oil	889	1,206	1,438
Jerked beef	2,647	1,033	1,662	1,401
Powdered meat.....	1,268	905	1,350
Meat extract.....	593	3,047	1,031	1,224
Sundry frozen meats	164	722	947	1,018

Imports and exports by countries, in thousands of pesos:

	Imports		Exports	
	1911	1912	1911	1912
United Kingdom...	108,637	118,669	91,841	121,373
Germany	65,862	63,942	43,073	53,995
United States....	52,353	59,127	24,300	32,391
France	38,027	37,619	39,692	36,052
Italy	29,346	32,487	13,587	21,148
Belgium	19,485	20,371	35,626	37,258
Spain	11,279	11,928	2,178	3,582
Brazil	8,461	9,547	17,824	22,646
Austria-Hungary..	4,304	3,477	2,398	2,897
Netherlands	2,978	3,442	6,440	16,027
Uruguay	3,070	2,497	2,341	4,714
Sweden	1,667	2,290	1,004	1,496
For orders.....	36,357	114,904
Total, including other	366,811	384,853	324,698	480,391

The exports "for orders" are not recorded at the Argentina ports as for specific countries, but are subject to cable or other orders as to final destination. Nearly all of these shipments reach the western European countries ultimately and in about the same proportion as the direct shipments given in the table above. The following figures show the percentage of imports and exports as shared by the more important countries:

	Imports			Exports		
	1910	1911	1912	1910	1911	1912
U. Kingdom.....	31.1	29.6	30.8	21.7	28.3	25.3
Germany	17.4	18.0	16.6	12.1	13.3	11.3
United States....	13.8	14.3	15.4	6.8	7.5	6.7
France	9.6	10.4	9.8	10.1	12.2	7.5
Italy	9.0	8.0	8.5	2.8	4.2	4.4
Belgium	5.6	5.3	5.3	8.2	11.0	7.8
For orders.....	27.8	11.2	23.9

The noticeable decline in the 1911 percentage "for orders" was due largely to the poor corn crop.

Imports and exports at the principal ports in thousands of pesos:

	Imports		Exports	
	1911	1912	1911	1912
Buenos Aires....	292,936	315,162	158,467	181,767
Rosario	37,800	32,466	44,114	85,119
Bahía Blanca....	8,167	11,476	25,645	69,010
La Plata	9,924	9,251	30,527	32,491
Santa Fé.....	3,798	3,397	12,572	13,965
Campana	3,646	3,033	7,245	7,331
San Nicolás.....	5	67	2,389	20,820
Zarate	865	1,184	8,516	11,105
Concordia	417	384	7,852	10,658

SHIPPING. The following table shows the movement at the ports in 1912, distinguishing the over-sea shipping from the total, which includes coasting and fluvial:

	Over-sea		Total	
	Vessels	Tons	Vessels	Tons
Steamers:				
Entered	4,100	10,252,962	35,171	21,392,854
Cleared	4,065	10,320,108	34,272	21,226,739
Sail:				
Entered	233	288,735	37,009	2,704,985
Cleared	225	278,730	38,732	2,586,918
Total	8,623	21,140,535	135,184	47,911,496
Buenos Aires.....	4,450	11,770,699	40,254	19,052,093

Merchant marine in 1912: 446 steamers, of 120,882 tons net, and 1241 sail, of 96,896 tons net.

COMMUNICATIONS. The development of the

Argentine railways is shown in the following table:

	1890	1900	1910	1912
Kilometers	9,432	16,563	27,989	32,853 ^d
Capital a	321,843	541,576	900,430	1,120,210
Passengers b	10,070	18,296	59,015	73,212
Freight c	5,421	12,660	33,607	38,870
Receipts a	26,049	41,404	110,941	129,700
Expenditure a	17,585	23,733	65,930	81,348

a In thousands of pesos gold. b In thousands.
c In thousands of metric tons. d 20,414 miles.

In 1912 the length of government railway was over 5600 kilometers. Railway of mean gauge constitutes less than one-twelfth of the total; narrow gauge, less than one-third; broad gauge, nearly two-thirds. In 1910, the telegraph extension amounted to 81,005 kilometers line, 161,476 kilometers of wire, and 2825 offices; post offices, 2995. A large new central station of the Central Argentine Railway was under construction at Buenos Aires, and considerable work was being done on the suburban and rapid transit systems of that capital. See RAPID TRANSIT. Other construction during the year were the La Plata-Meridiano, the Villa Balastir-Rosario-Santa Fé, the Concordio-Concepcion, numerous branches of the Buenos Aires Great Southern, and extensions of the Buenos Aires Great Western, the Rosario-Mendoza and the communication with Chili by the Lerna Valley. The construction of a railway from Mercedes to Paso Claro was approved by the legislature of Corrientes, while plans and specifications for the construction of a state line from San Juan to Jachal were completed towards the end of the year and tenders for construction were shortly to be called for. The province of Buenos Aires was negotiating for the purchase of the La Plata Railway and it was reported sold for \$500,000.

FINANCE. The unit of value is the gold peso, worth 96.5 cents; the paper peso, under the conversion law of 1899, is current at 0.44 of the gold peso. In 1905 the revenue in paper and in gold reduced to paper value, amounted to 205,341,838 pesos; in 1908, 254,232,013; in 1910, 304,679,200. The budget for 1913 showed an estimated revenue of 126,464,301 pesos paper and 94,964,581 pesos gold; expenditure, 420,975,866 pesos paper. The larger estimated receipts were: Customs, 83,830,000 pesos gold; excise, 64,929,000 paper; stamps, 18,000,000 paper; posts and telegraphs, 15,370,000 paper; port dues, etc., 8,392,000 gold. The larger avenues of estimated expenditure were: Public debt, 83,936,194 pesos paper; ministry of justice and public instruction, 66,857,808; interior, 46,799,301; war, 29,840,716; marine, 26,083,313; finances, 22,030,140; agriculture, 15,517,877; pensions, 13,192,000; the total of 420,975,880 pesos paper, including extraordinary expenditure amounting to 108,135,504 pesos.

The public debt, December 31, 1912, amounted to 457,745,087 pesos gold and 988,082,434 pesos paper, comprising the foreign debt of 297,993,975 pesos gold, the internal debt of 159,751,700 pesos gold and 167,619,140 pesos paper, the floating debt of 34,064,123 pesos paper, and outstanding paper money aggregating 988,082,434 pesos.

NAVY. In 1913 the Argentine navy included the following: 1 dreadnaught (*Rivadavia*, launched in 1911), of 28,000 tons; 2 old coast

guards (1890 and 1891), of 4600 tons; 1 old coast guard (*Almirante Brown*, 1880), of 4200 tons; 4 armored cruisers (*Garibaldi*, 1896; *General San Martín*, 1897; *General Belgrane*, 1898; *Pueyrredon*, 1898), of 27,400 tons; 3 protected cruisers (1890 to 1895), of 11,620 tons; 2 old torpedo cruisers, of 1776 tons; 2 armored river gunboats (1908), of 2000 tons; 11 torpedo-boat destroyers, of 9000 tons; torpedo boats, transports, several old craft, etc. In April, 1913, four new torpedo boats, to take the place of the four sold to Greece in 1913, were ordered from the Krupps; they will burn oil fuel only. The dreadnaught *Moreno*, launched in 1911, was nearing completion late in 1913 at the yard of the New York Shipbuilding Company, of Camden, N. J. The *Rivadavia* was completed in 1913 by the Fore River Ship and Engine Building Company, of Quincy, Mass. She ran her trials in August, attaining a speed of 22½ knots. She has a length of 585 feet, beam 98 feet, normal draft 27 ft. 6 in., average horse power 40,000, and full-load displacement 30,600 tons. She has a main battery of 12 12-in. guns, and in addition 12 6-in., and 16 4-in. guns and 2 21-in. torpedo tubes. Her complement of men is 1050. The cost of the *Rivadavia* and sister ship *Moreno* is about \$22,000,000.

GOVERNMENT. Argentina is a federal republic, with a constitution similar to that of the United States. The federal legislative power is vested in a congress of two houses, the Senate and the Chamber of Deputies. The Senate has 30 members, elected indirectly for nine years, two from each of the fourteen provinces and the Federal District; the Chamber has 120 members, elected directly for four years. The executive power rests with a president who is chosen for a term of six years by an electoral college and is ineligible for the next term; he is assisted by a responsible ministry of eight members. For the term ending October 12, 1916, president, Roque Sáenz Peña; vice-president, Victorino de la Plaza. The provinces elect their own governors and legislatures. The territories are administered by governors appointed by the president. Buenos Aires (Federal District) is administered by a mayor, whose appointment by the president is approved by the City Council (elected by popular vote) and by the Federal Senate.

ARMY. The army of Argentina consists of a regular army, a national guard, and a territorial army, the last two being organized by provinces. The effective strength provided for consists of 1449 officers, and 20,082 men. Mobilized for war the army of the republic should supply an effective strength of 2,600,000 men, of which about 220,000 have received military instruction. The active army was organized in ten brigades of two regiments each of infantry, nine regiments of cavalry of four squadrons each, in addition to a regiment of mounted troops of five squadrons for escort service, five regiments of field artillery, divided into two groups of two batteries each, one regiment of howitzers divided into three batteries of four pieces each, two regiments of mounted artillery divided into four batteries, one section of heavy artillery, five battalions of engineers divided into three companies each, of which one are pioneers, one bridge troops and one telegraph troops. One battalion of railway troops of three companies, and five companies of train. The

army is recruited by compulsory service between the ages of 20 and 45 years and the selection is on a territorial basis, the recruits being selected by lot. The duration of active service is one year, after which the men pass into the reserve until the age of 30. A portion of the reserve is designed to complete the war effective strength of the permanent units, while the remainder form the units of the second line. The reservists have two periods each month of instruction and once with rifle practice. The troops of the first line are armed with a new model Mauser rifle and a Krupp quick-firing field gun. In 1913 a second battalion was added to each of the even numbered infantry regiments. This decree further provided that the existing third companies of the first battalions both of even and odd-numbered regiments in each brigade would constitute the second battalion of even-numbered regiments. Consequently all of the 20 infantry regiments will have two battalions of two companies each.

HISTORY

THE PRESIDENT'S MESSAGE. The National Congress was opened on May 7. In his message to Congress, President Peña commented favorably on foreign relations, calling attention to the fact that survey monuments were being erected along the Chilean boundary, that the Paraguayan boundary survey had been resumed in the Chaco region along the upper reaches of the Pilcomayo River, and that the disputed Bolivian boundary was being surveyed in accordance with the protocol signed at La Paz, September 15, 1911. The president also stated that the revenues for 1912 had amounted to 405,237,115 pesos, thus giving a surplus of 2,398,476. Moreover, that revenues were steadily increasing was shown by the receipts for the first quarter of 1913, which exceeded those of the first quarter of 1912 by 16,034,911 pesos gold. The development of railways was emphasized. The total length of non-private railways, the president said, amounted to 32,624 kilometers on January 1, 1913.

CONGRESS. Among the foremost problems presented to Congress was the regulation of the packing industry. The exportation of meat had fallen under the control of a combination which employed such unfair methods of competition as selling livestock below cost in order to ruin competitors, and making and breaking agreements limiting the production of meats for England. As a partial remedy for this situation, the minister of agriculture presented a bill which would permit the slaughter for export of 4000 head of cattle and 30,000 sheep a week, but would levy a fine of 50 pesos a head for any above that number. The executive would be entrusted with power to raise or lower the limit as the exigencies of the moment required. This measure, together with the establishment of a general market for livestock, and the enactment of anti-combination laws discussed late in October, would, it was hoped, insure the stability and prosperity of the meat industry.

Finance and the construction and operation of railways were the subjects of lively debate, and occasioned a cabinet crisis. The difficulty was overcome by the reconstruction of the cabinet with three new ministers: Finance, Dr. Lorenzo Anadon; public works, Dr. Carlos

Meyer Pellegrini; and education and justice, Sr. Carlos Ibarguren. The ministry now presented a united front and could take up the railway question with more vigor. During the course of the discussion the Senate evolved an interesting proposition to rent the state railways out to private companies. In the Chamber a proposal of the *Cia. Regie Generale de Chemino de Fer et Travaux Publics* was heard; the company would construct 2320 miles of state railways at an estimated cost of \$105,474,700, to be worked 6 years under state control, and pay 80 per cent. of the profits to the state. Finally the minister of public works decided on a programme of railway construction which would involve the expenditure of 2,007,967 pesos for the remainder of 1913, and 5,000,000 pesos up to October 31, 1914. As far as the budget for 1914 was concerned, the receipts were estimated at 451,488,000 pesos and the expenditures at 451,439,000 pesos, of which 34 millions were for harbors, 20 for railways, and 63 for education. The policy of the government was explained by the minister of finance as a gradual abandonment of the protective tariff; and, as a step towards the accomplishment of this end, he proposed to lower the import duties on sugar.

Other markets under discussion by the congress were: A bill authorizing the national *Banco Hipotecario* to issue loans to public employes who wished to build or buy dwellings for themselves; and a bill to pension the staffs of state and private railways. A code of sanitary regulation and pure food laws was promulgated. A bill for the punishment of "white-slave dealers" was introduced by the Socialist deputy, Dr. Palacios (in the last elections the Socialists elected one senator and two deputies), and passed by both houses.

FOREIGN RELATIONS. On June 17 a protocol was signed with Bolivia for the immediate construction of a railway from Tupiza in southern Bolivia to Quiaca. The delimitation of the boundary along the Chilean, Paraguayan, and Bolivian frontiers has already been referred to under the president's message (*supra*). Benito Villanueva, vice-president of the senate, planned to sail for the United States on November 26, to repay the visit which Mr. Elihu Root, as Secretary of State, paid to Argentina several years ago; the date of Señor Villanueva's departure was delayed, however, by the trials of the new Argentine super-dreadnought *Rivadavia*.

In November Colonel Roosevelt, ex-President of the United States, visited the Argentine Republic. Although the numerous utterances of the colonel were quite unofficial, since he spoke as a private citizen, nevertheless great interest attached to his speech at the University of Buenos Aires in which he declared that the Argentine Republic, now capable of defending itself, should be considered as an equal of the United States, a co-guarantor of the Monroe Doctrine.

MISCELLANEOUS. The president was authorized to have a naval hospital constructed at Buenos Aires at a cost of 2,541,130 pesos. On June 8 a statue of ex-President Avellaneda was unveiled at Buenos Aires. In July the republic celebrated the ninety-seventh anniversary of its independence.

ARIZONA. POPULATION. The population

of the State in 1913, according to the estimates of the Census Bureau, was 230,808.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acres	Prod. Bu.	Value
Corn	1913	17,000	478,000	\$ 524,000
	1912	16,000	528,000	528,000
Wheat	1913	29,000	928,000	1,021,000
	1912	23,000	707,000	778,000
Oats	1913	7,000	301,000	150,000
	1912	6,000	268,000	188,000
Potatoes	1913	1,000	75,000	101,000
	1912	1,000	125,000	156,000
Hay	1913	135,000	540,000	5,940,000
	1912	113,000	384,000	4,608,000

a Tons.

MINERAL PRODUCTION. The production of gold, silver, copper, lead, and zinc in the State in 1913, according to estimates made by the United States Geological Survey, was valued at about \$71,000,000, an increase of nearly six per cent. over the value of 1912, which was \$67,050,784. The copper output was valued at nearly \$64,000,000; the gold at about \$3,948,000; the silver at more than \$2,263,000; the lead at \$612,000; and the zinc at \$510,000. The yield of gold in 1913 was more than 191,000 ounces, an increase of five per cent. over the output of 1912. The silver production increased about eight per cent., amounting to more than \$3,773,000. Arizona led all other States in 1913 in copper production. There was a mine production of about 414,593,000 pounds. This was an increase of nearly 49,000,000 pounds over the production of 1912. As the price of copper was slightly lower in 1913, the value of metal increased only about \$3,500,000. There were eleven active copper smelting plants in the State during the year.

In 1912 Arizona produced 359,322,096 pounds of blister copper, as compared with 303,202,532 pounds in 1911. The production of 1912 was the largest in the history of the State, or of any State, and about 29 per cent. of the total output of the country. The greater part of the production is from five districts—the Bisbee, the Morenci-Metcalfe, the Jerome, the Globe, and Mineral Creek districts. Other districts making important production of copper are the Big Bug and Copper Basin districts of Yavapai County, the Palmetto district of Santa Cruz County, the Pima of Pima County, and the Pioneer district of Pinal County.

The gold production of the State in 1912 was valued at \$3,762,201, compared with \$3,430,503 in 1911. The output of 1912 was the largest in recent years, and the increase was mainly due to greater production from the gold milling ores of Mohave County, and from the copper ores of Cochise County. In the output of gold, Mohave County again led, producing \$1,899,831, or half the total in 1911. Cochise County ranks second, with its largest output from the copper ores of the Warren district.

The silver output of the territory was 3,490,387 fine ounces, compared with 2,276,571 fine ounces in 1911. Of the total output, Cochise County produced 1,962,644 ounces, and Yavapai County 748,872 ounces. Of the total silver production in 1912, copper ores supplied 2,378,593 ounces.

EDUCATION. The total school population in 1913 was 46,681. The total enrollment in the public schools was 35,160, and the average daily attendance was 25,003. The number of male teachers employed numbered 149 and the female teachers 871. The average monthly salary of male teachers was \$107.92, and the female teachers \$83.40. The legislature of Arizona has passed many advanced measures relating to education. These include a teachers' retirement act, under which rewards are made to teachers who have attained the age of 65 years. The first session of the legislature revised the old school laws and enacted many new ones. New high schools were erected in 1912 and 1913 at Winslow, Glendale, Yuma, Bisbee, and Globe. The State university forms a part of the education system.

TRANSPORTATION. The total railway mileage in the State on July 1, 1913, was 2135. On that date the Southern Pacific Railway had 537 miles of track, the Atchison, Topeka, and Santa Fé (coast line), 408, the Arizona Eastern Railway Company, 375, the Santa Fé, Prescott, and Phoenix lines, 364, and the El Paso and Southwestern system, 183. The remaining mileage is that of smaller local roads. There was a small amount of construction during 1913.

FINANCE. There was a balance in the treasury on June 30, 1912, of \$411,441. The total receipts for the fiscal year ending June 30, 1913, amounted to \$3,825,367. The disbursements for the same period amounted to \$3,193,352, leaving a balance in the treasury at the end of the fiscal year of \$1,073,456. The chief receipts are from taxes of various kinds, and the chief disbursements are for education, State institutions, and for State officers. The county taxes collected in the fiscal year amounted to \$1,252,573. The funded debt of the State, which includes county and city indebtedness, funded by the issuance of bonds, amounted to \$2,098,302.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State, with their populations in 1913, are as follows: The State Prison at Florence, 430, the State Industrial School at Fort Grant, 133, the State Hospital for the Insane at Phoenix, 423, the Home for Aged and Infirm Arizona Pioneers at Prescott, 40, the Florence Crittenden Home at Phoenix, 9, the Arizona Children's Home at Phoenix, 15, St. Luke's Home, (a tubercular sanatorium adopted by the Protestant Episcopal Church), Phoenix, 42. During the year a new building for education and recreation was completed for the State prison. The industrial school was removed to Fort Grant, where buildings are being remodeled and some of the land cultivated. Several important measures relating to charities and corrections were passed by the legislature of 1913. Provision was made for a board of pardons and paroles, to replace the present board of commissioners of paroled prisoners.

POLITICS AND GOVERNMENT. The legislature met in 1913, and passed a number of important measures which are noted in the section *Legislation* below. There was no election for State officers during the year. The term of the governor expires on December 31, 1914, and the next State election is on November 3, 1914.

The discussion of the alien land laws in California generally obscured the fact that the legislature of Arizona passed measures much

more radical than those which resulted from a compromise in California. The bill passed corresponds closely to those measures which were abandoned in California, which directly prohibited aliens who have not declared their intention of becoming citizens from acquiring land. This bill was passed by the lower house of the legislature on May 5, and was approved by the Senate on May 12, and signed by the governor on May 16. Protests were made against the passage of the bill by the Japanese Association of Arizona. No active measures were taken by the United States government to influence the State legislature against this passage.

On November 4, the Arizona Bank and Trust Company was closed by the State bank examiner.

LEGISLATION. The legislature was in session in 1913 and many important measures were passed. These included acts putting into effect the woman suffrage amendment to the constitution, adopted at the election of November, 1912. This session also passed an inheritance tax law, a pure food law, an alien land law, similar to, but somewhat more stringent than, the California act, an eight-hour law for women, a \$.03 fare law, and laws carrying into effect the initiative, referendum, and recall provisions of the constitution.

STATE GOVERNMENT. Governor, Emmett O'Neal; Lieutenant-Governor, W. D. Seed; Secretary of State, Cyrus B. Brown; Auditor, C. B. Smith; Adjutant-General, J. B. Scully; Attorney-General, R. C. Brickell; Treasurer, John Purifoy; Superintendent of Education, W. F. Feagin; Commissioner of Agriculture, R. F. Kolb; ex-officio Commissioner of Insurance, Cyrus B. Brown—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, J. R. Dowdell; Associate Justices, Ormond Somerville, A. D. Sayre, John C. Anderson, Edward de Graffnried, J. J. Mayfield, and Thomas C. McClellan; Clerk, R. F. Ligon—all Democrats.

The State representatives in Congress will be found in the section *Congress*, article UNITED STATES.

ARIZONA, UNIVERSITY OF. A State institution for higher education, founded at Tucson, Ariz., in 1885. The number of students enrolled in all departments of the university in the autumn of 1913 numbered about 200. The faculty numbered about 45. A home economics department was added in 1913. The college received about \$9000 for the purchase of mining apparatus. The productive funds amount to about \$20,000, and the annual income to about \$150,000, of which \$100,000 comes from the State and \$50,000 from the United States government. The library contains about 18,000 volumes. The president is Arthur H. Wilde, Ph. D.

ARKANSAS. POPULATION. The population of the State in 1913 was 1,659,859, according to the estimates of the Bureau of the United States Census.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only:

		Acreage	Prod. Bu.	Value
Corn	1913	2,475,000	47,025,000	\$36,680,000
	1912	2,475,000	50,490,000	33,828,000
Wheat	1913	101,000	1,313,000	1,182,000
	1912	94,000	940,000	884,000

		Acreage	Prod. Bu.	Value
Oats	1913	240,000	6,360,000	3,371,000
	1912	175,000	3,482,000	1,741,000
Rye	1913	1,000	12,000	11,000
	1912	1,000	10,000	10,000
Rice	1913	104,700,000	3,769,000	3,392,000
	1912	90,800	3,405,000	3,201,000
Potatoes ...	1913	25,000	1,800,000	1,800,000
	1912	25,000	1,750,000	1,610,000
Hay	1913	320,000	a 384,000	5,184,000
	1912	286,000	352,000	4,224,000
Tobacco	1913	800	b 520,000	85,000
	1912	800	520,000	94,000
Cotton	1913	2,210,000	c 900,000	49,987,000
	1912	1,991,000	792,000	46,627,000

a Tons. b Pounds. c Bales.

MINERAL PRODUCTION. The total production of coal in 1912 was 2,100,819 short tons, valued at \$3,582,789. This was 5970 tons less than the production of 1911 and was due to the suspension of work on April 1, 1913. The prospect for the advancement of coal mining in the State was not bright. In addition to mining difficulties with which operators have to contend, competition with fuel oil and natural gas from the mid-continent field and with the more cheaply made coals of Alabama, Kentucky, Illinois, and Colorado, has restricted the markets for Arkansas to comparatively narrow limits. The labor market in 1912 was unusually short; the number of men being fewer by 1121 or 20 per cent. than in 1911, 4536, as compared with 5657. According to the United States Bureau of Mines, there were six men killed in the coal mines of the State in 1912. Five of these by falls of roof.

TRANSPORTATION. The railway mileage of the State in 1913 included 4,797.82 miles of main line, and 1364.44 miles of side track. There were ten companies operating electric railways, with a total mileage in the State of 113.72.

EDUCATION. The total school population on June 30, 1913, was 617,265. Of these 435,575 were white and 181,790 were negroes. The total enrollment in the public schools was 429,462, of whom 317,386 were white and 112,076 colored. The average daily attendance was 278,929; in the white schools, 208,490, and in the colored schools, 70,439. The total number of teachers was 10,234, of whom 8207 were white and 2027 were colored. The average annual salary paid teachers was \$327.40. The expenditures for public schools during the year was \$4,279,478.

FINANCE. The receipts for the fiscal year 1911-12 were \$6,899,247, and the expenditures were \$6,734,915. There was a balance at the end of the fiscal year of \$800,770. The chief source of income of the State is the direct tax on all property. The chief expenditures are for schools and charitable and State institutions. The debt of the State amounts to about \$1,250,000.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions in the State include the State Hospital for Nervous Diseases at Little Rock, Deaf Mute Institute at Little Rock, School for the Blind at Little Rock, Confederate Soldiers' Home at Sweet Home, the Arkansas State Penitentiary and State Farm, and the Arkansas Reform School at Little Rock. The charitable institutions are controlled by the board of trustees on charitable institutions, and the correctional institutions by the State penitentiary commissioner.

LEGISLATION. The legislature met in 1913 and the important measures passed include the

following: An employers' liability act was extended to all corporations. It was formally applicable to railroad corporations only. A commission form of government was made permissible in cities having population between 18,000 and 40,000. The method of executing the death penalty was changed from hanging to electrocution. A uniform negotiable instruments law was passed. Stringent anti-tipping acts and the severe white slave law was passed. The legislature also enacted a blue-sky law, patterned after the Kansas statute. The right of referendum was extended to municipal corporations. A corrupt practices act was passed. This prevents candidates for Congress, including United States senators, from expending more than the income of their office for one year. Other provisions restricted expenditures in primary elections. The anti-trust law was modified to permit fire insurance companies to join in the employment of a common rate expert. The anti-trust law of 1905 was amended. This law had been construed to prohibit corporations which were members of combinations elsewhere from doing business in the State, even though there were no showing of unfair practices within the State. As a result of this construction many large corporations like the International Harvester Company left the State. The law of 1905 also provided that prosecuting attorneys should receive twenty-five per cent. of the sums collected in the prosecutions. The amendment of 1913 abolished the twenty-five per cent. provision and permitted the attorney-general only to bring suits. It further amended the law to prohibit only acts done within the State, tending to carry into effect a conspiracy, and provided that doing business in a lawful manner within the State shall not be deemed such an act. It is believed that most of the large corporations which withdrew on account of the interpretation of the 1905 act will now return to the State.

POLITICS AND GOVERNMENT. In 1913 Arkansas had five governors, George W. Donaghey, whose term ended January 16; Joe T. Robinson, who was elected governor in September, 1912, and served from January 16 to March 8, when he resigned to take his seat in the United States Senate, to which he had been elected by the legislature; W. K. Oldham, who, as president of the Senate, succeeded Robinson and served from March 8 to March 23; J. M. Futrell, who was elected president of the Senate, succeeded Oldham as acting governor and served from March 23 to August 6; and George W. Hays, who was elected governor at the special election in July and took office August 6. For five days both Oldham and Futrell claimed the governorship. By agreement the disputed question, which was one of constitutional interpretation, was submitted to the Supreme Court, which decided in favor of Futrell. In 1913 Arkansas had four United States senators besides Senator James P. Clarke. These were: Jeff Davis, who died on January 2; J. N. Heiskell, editor of the *Arkansas Gazette*, who was appointed by Governor Donaghey and served from January 6 to January 29; W. M. Kavanaugh, who was elected by the legislature for the remainder of the short term and served from January 29 to March 4; and Joe T. Robinson, who was elected on January 30 by the legislature for the term beginning March 4. The State legis-

lature, which met in January, passed what is known as the Going law, which provides that before licenses can be granted for saloons in any municipality a petition must be presented to the county judge signed by a majority of the "adult white inhabitants." This includes white women and excludes negroes. Opponents of the Going law sought to have it taken before a referendum, but the Supreme Court decided that the "emergency clause" attached to the bill by the legislature was valid, the "emergency clause" having the effect of preventing the referendum being invoked against a law. At this time licenses have been granted on presentation of petitions in Hot Springs, Fort Smith, Helena, Argenta, and some smaller places, and hearings are in progress on petitions in other cities of the State.

STATE GOVERNMENT. Governor, George W. Hays; Lieutenant-Governor, Secretary of State, Earle W. Hodges; Treasurer, John W. Crockett; Auditor and Insurance Commissioner, L. L. Coffmann; Attorney-General, W. L. Moose; Superintendent of Education, Geo. B. Cook; Commissioner of Agriculture, J. H. Page; Commissioner of Public Lands, R. G. Dye—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Edgar A. McCulloch; Justices, F. G. Smith, C. D. Wood, William F. Kirby, and Jesse C. Hart; Clerk of the Court, P. D. English—all Democrats.

STATE LEGISLATURE, 1913. Democrats: Senate, 33; House, 96; joint ballot, 129. Republicans: Senate, 1; House, 4; joint ballot, 5. Progressives: Senate, 1; joint ballot, 1. Democratic majority: Senate, 31; House, 92; joint ballot, 123.

The representatives in Congress will be found in the article UNITED STATES, section *Congress*.

ARKANSAS. UNIVERSITY OF. A State university for the higher education, founded at Fayetteville, in 1871. The students enrolled in all departments of the university in 1913 numbered 1180. There were 156 members of the faculty. The productive funds amount to about \$130,000, and the annual income, most of which is furnished by the State, to about \$20,000. The library contains about 25,000 volumes. The president is J. C. Futrell, M. A.

ARBOL, SIR WILLIAM. A Scotch engineer, died February 20, 1913. He was born in 1839 at Houston in Renfrewshire. At the age of fourteen he began his apprenticeship in a blacksmith shop, at the same time studying in the evening schools. For five years he was a foreman in the boiler works of Messrs. Laidlaw & Sons, Glasgow, and then engaged in business for himself. His first undertaking was the construction of boilers, to which he soon added steel work, bridges, workshops, etc. He introduced many new and radical methods of construction. He built the Caledonian Railway Bridge in 1875; the Forth Bridge, 1882-1887; the Tay Viaduct, during the building of the Forth Bridge; and the steel work of the Tower Bridge in London, 1886-1894. Many of the bridges over the Manchester Canal are his work.

He secured the contract for the bridge over the Nile at Cairo. These accomplishments, with many others, entitle him to rank as one of the greatest bridge builders of his day. In 1896 he was elected to the House of Commons, and continued in Parliament until 1906, when he retired.

ASBESTOS. The production of asbestos in the United States in 1912 was obtained from three States, Georgia, Vermont, and Wyoming. The relative quantity produced is small. In 1912 it was 4403 short tons, valued at \$87,959, a considerable decrease over the production of 1911, which was 7604 short tons, valued at \$119,955. By far the larger part of the asbestos used in the United States is imported from Canada. In 1912 this amounted to 71,426 tons, valued at \$1,441,475. The total value of the imports in asbestos in 1912 was \$1,456,012. Asbestos has been found in Arizona in considerable quantities, but difficult access has as yet made its production unprofitable. Vermont is by far the most important producer of chrysotile asbestos. The total output of asbestos in Canada in 1912 was 97,816 tons.

ASHANTI. See GOLD COAST.

ASHBOURNE, EDWARD GIBSON, first baron. A British jurist, died May 28, 1913. He was born in Dublin in 1837; educated at Trinity College; in 1860 admitted to the bar, and in 1877 made a bencher of the King's Inns. In 1874 he stood for Parliament as a Unionist, but was defeated. A year later he was more successful and was returned for Dublin University. He was appointed attorney-general in the cabinet, an office which he held until 1880. On the accession of his party to power in 1885 he was appointed Irish lord chancellor, and shortly afterwards raised to the peerage, with the title of Baron Ashbourne. After the general elections of 1886 and 1895 he resumed his office and reentered the cabinet.

ASIA MINOR, EXPLORATIONS IN. See ARCHEOLOGY.

ASPHALT. The total quantity of asphaltic materials produced in the United States in 1912 was 449,510 short tons, valued at \$4,620,731. This included all the varieties of asphalt and also sandstone and limestone impregnated with asphalt. The production in 1911 was 364,266 short tons, valued at \$3,991,109. California is the most important producer of asphalt. In 1912 the production in that State was 249,331 tons, valued at \$2,180,403. In Texas there were produced 945,532 tons, valued at \$1,404,266; in Oklahoma, 65,717 tons, valued at \$341,373; and in Utah, 39,930 tons valued at \$688,689. The chief increase in 1912 was in oil asphalt in Texas and California. The United States is the largest producer of asphalt and is followed by Trinidad, which in 1912 produced 189,496 tons. It is also pro-

duced in Germany, France, Italy, Spain, Austria, Russia, and Venezuela. Exports of asphalt in 1912 were valued at \$1,170,882. This includes both manufactured and non-manufactured asphalt.

ASTRONOMY. The year 1913 showed steady progress in observational astronomy and astrophysics. At the conference of the International Union for Solar Research, which was held at Bonn, Germany, from July 30 to August 5, important steps were taken to add to the present efficiency of those departments of solar research in which international coöperation is found to be necessary. No striking discoveries marked the year, but the number of minor planets announced as new showed an increase over the numbers recorded during the past few years, almost reaching the century mark. Westphal's Comet, last seen in 1852, reappeared, and, while its return did not arouse the interest of the general public to the same extent as did Halley's Comet in 1910, it received considerable attention from astronomers. Five other comets were seen, only one of which—Giacobini's—had been recorded previously.

MOUNT WILSON SOLAR OBSERVATORY. Professor Hale, in his report of the work carried on by himself and his associates during 1912 at the Mount Wilson Solar Observatory, called attention to the valuable results obtained from coöperation with distinguished astronomers from other observatories who had found the instrumental facilities afforded by the observatory eminently adapted to the furtherance of their investigations. Among them may be mentioned Professor E. E. Barnard, of the Yerkes Observatory, who made a series of both visual and photographic observations of the planets Mars and Saturn with the 60-inch reflecting telescope; the surface of the former planet showed immense complexity of detail, but he was unable to detect any trace of the system of fine lines drawn by Lowell. Professor Kapteyn of Groningen made an extensive series of observations on the radial velocities of the helium stars of his Star Streams I. and the A stars of his Streams I. and II., and obtained greatly improved data for the positions of the vertices of both streams. Professor Hertzsprung, of the Potsdam Astrophysical Observatory, spent four months at Mount Wilson for the purpose of measuring the effective wave-lengths of faint stars. Professor Carl Störmer, of Christiania, who had for some years devoted himself to a study of the aurora borealis, investigated the theory of the sun's general magnetic field with view to its application to his own and Birke-land's hypotheses as to the nature of the aurora and the form of the coronal streamers.

SUN-SPOTS. In 1908, soon after he had established the existence of intense magnetic fields in the sun-spots, Professor Hale made an attempt to observe the Zeeman effect due to the

general magnetic field of the sun, but was not successful in detecting it. With the resumption of his duties as director of the observatory he again took up the problem, which, owing to the absence of sun-spots and other disturbing influences likely to mask the slight effect expected, seemed more hopeful of solution. Comparatively few of the lines selected showed any displacement; those which did, however, suffered displacement of opposite sign in the two hemispheres of the sun, decreasing in magnitude from a maximum near latitude 45° to about zero at the solar equator. Although the results could not be said to be conclusive, they were considered of sufficient importance to warrant the continuance of the investigation. As a guide to further research, Professor Hale proposed the following tentative working hypothesis of sun-spots: As the result of an eruption or some other cause tending to produce rapid convection, a column of gas is projected upward from within the sun toward the surface of the photosphere. As this rises, differences in the velocities of adjacent surfaces give rise to vortex motion, the circulation being vertically upward and then outward along the surface of the photosphere. Owing to expansion, cooling takes place at the centre of the vortex, and the central dark cloud or umbra results. Negative ions now flow in rapidly from the hot gases outside to the cooler gases in the centre, and, partaking of the vortical motion, give rise to a magnetic field. The hydrogen gases in the higher atmosphere of the sun are drawn in toward the pole of the magnet along the lines of force. If the spot is bipolar—and this is the usual form—its polarities are opposite, and the hydrogen flocculi are arranged in lines resembling the lines of force due to a bar magnet. The two poles may be regarded either as the ends of a single vortex of horseshoe shape or of two distinct, straight vortices with their axes coinciding with radii of the sun, and hence nearly parallel. Further study of bipolar groups will be necessary in order to decide between these two hypotheses of the constitution of a bipolar sun-spot.

REFLECTING TELESCOPE. The construction of the 100-inch reflecting telescope was delayed through the unsatisfactory character of the disk supplied from the St. Gobain works. The great difficulty of obtaining a disk of the requisite diameter and thickness free from internal flaws induced Professor Hale to put in hand the grinding of the disk supplied to the observatory some years ago, with the result that it seems probable that it can be used ultimately. The completion of the 150-foot tower telescope and the 75-foot combined spectrograph and spectroheliograph was reported. Both instruments were thoroughly tested and found to be entirely satisfactory.

THE ROTATION OF THE SUN. In the *Astrophysical Journal*, Plaskett and De Lury gave the results of an investigation of the rotation of the sun which they conducted at the Dominion Observatory at Ottawa in 1911. The special region of the spectrum allotted to the Ottawa observers was in the yellow-green at the Solar Research Conference at Mount Wilson in 1910 from $\lambda 5500$ to $\lambda 5700$. The values obtained were in substantial agreement with those published previously by Duner and

Adams, the linear velocity at the solar equator being 1.536 kilometers per second.

RADIAL MOTION IN SUN-SPOTS. St. John, in the *Astrophysical Journal*, discussed the distribution of the elements in the solar atmosphere. The relative levels of the lines of 26 elements were determined by comparing their displacements with those of the lines of iron of equal intensity and in the same spectral region. A striking resemblance to the state of the terrestrial atmosphere was found. In the lower solar atmosphere, the region including the lowest levels of the reversing layer and especially the underlying gases, is the region of tremendous disturbance. Storms and convection currents tend to keep the composition sensibly uniform, and the elements present are neodymium, barium, lanthanum, lead, cadmium, ytterbium, niobium, and cerium. The motion is outward from the centre of the sun-spot vortex, and is greater the lower the level at which it takes place. Above this turbulent region is the general reversing layer, a region in which there is more stable equilibrium with a preponderance of inward motion, and in which sodium, magnesium, aluminum, and iron are present. From this region the chromosphere is quite sharply differentiated both in its composition and the movements of the constituent gases in the neighborhood of the sun-spots. The motion is inward toward the core of the vortex and increases as the surface is approached, while the gases involved are hydrogen and those forms of gaseous calcium which give rise to the H and K lines. It was suggested that possibly the study of solar storms which are viewed from above might afford some help in understanding the circumstances attending terrestrial storms which are viewed from below.

INTERNATIONAL UNION FOR COÖPERATION IN SOLAR RESEARCH. The fifth congress of this body met at Bonn from July 30 to August 5, and was attended by about a hundred delegates from Europe and America. A number of important resolutions tending toward the unification and systematization of the work to be accomplished by international coöperation were adopted on the recommendation of the various committees. Among them may be mentioned the precise specification of the length of the arc, the part of the arc, and the strength of current to be used in the determination of standards of wave length; the provisional use of the Harvard modification of the Draper system in the classification of stellar spectra; and the continuance of systematic visual observations on the umbral spectrum for at least another three years so as to complete a sun-spot cycle. In view of the systematic differences to be found in the value of the solar rotation obtained by different observers, the committee on determination of the solar rotation recommended that the programme laid down in 1910 should be temporarily abandoned, and that work in this field should be concentrated on a search for the sources of error; for this purpose it was recommended that determination of the velocity at solar equator should be made by as many different methods as possible. The committee on work with the spectroheliograph was reorganized as the committee on solar atmosphere so as to include and unify all the observations on the solar atmosphere visual and photographic, ex-

cept those associated with eclipses. The committee was further divided into two sub-committees, one of which will confine its attention to the visual observation of prominences and related phenomena, while the other will concern itself with the photography of the forms and the determination of the velocities manifested in the solar atmosphere both of the disk and limb.

SOLAR CONSTANT. In the annals of the Astrophysical Observatory of the Smithsonian Institution, Abbot published an exhaustive account of the investigations undertaken by himself and Fowle between 1902 and 1913. Observations were conducted at four stations, namely, at Washington, from 1902 to 1913; at Mount Wilson, California, from 1905 to 1912; at Mount Whitney, during 1909-10; and at Bassour, Algeria, during 1911-12. The altitudes of the stations ranged from thirty-one feet above sea-level at Washington to 14,500 feet on Mount Whitney. It was found that the effective radiating layer of the sun is roughly comparable with a black body at 6000° abs. C.; in general, however, the prevailing solar radiating temperatures were greatly in excess of 6000°, and at times even exceeded 7000° abs. C. The investigation proved conclusively that the solar radiation is subject to a variation of irregular period and amplitude, the period being from a week to ten days, while the variation in amplitude is small, not exceeding seven per cent. as a rule. Besides this short period variability of the sun, there were indications of an intimate relation between the intensity of the solar radiation and the sun-spot frequency. An increase in the number of sun-spots is accompanied by an increase in the radiation intensity, but further investigation is needed to establish the exact relation. The mean value of the solar constant deduced for the epoch 1902-13 is 1.932 calories (15°C.) per sq. cm. per minute.

THE ALBEDO OF THE EARTH. In the *Astronomische Nachrichten*, Very published the results of his investigation of the earth's albedo, that is, the ratio of the light reflected from the earth to the light received. A comparison of the earth shine on the moon and the light from similar sun-illuminated areas on the lunar surface was made by visual photometric methods. It was found that the ratio of moon-light to earth shine was 2497 to 1, and from this it was estimated that the albedo of the earth is .89, or practically the same as the albedo of Saturn, as estimated by Muller.

STELLAR TEMPERATURES. Two independent researches on the effective temperatures of the stars were reported by Rosenberg and Nordmann. The determinations of the former were based on the intensity of the photographic spectrum, while the latter derived his results from observations on the visual rays with the aid of his heterochromatic photometer. The following table shows the temperatures in a number of cases where the same star was measured:

Star	Effective temperature in degrees absolute		Lockyer's spectral type
	Nordmann	Rosenberg	
δ Persei	18,500	15,500	Algol
Algol	13,300	12,000	Algol
Vega	12,200	22,000	Sirius
α Persei	8,300	6,500	Polaris

Star	Effective temperature in degrees absolute		Lockyer's spectral type
	Nordmann	Rosenberg	
Procyon	6,800	7,000	Procyon
Polaris	8,200	5,200	Polaris
γ Cygni	5,620	5,100	Polaris
Sun	5,320	4,950	Arcturus
Capella	4,720	4,500	Arcturus
β Andromedæ	3,700	2,650	Antares
Aldebaran	3,500	2,150	Aldebaran

Except in the case of Vega, the agreement may be considered fairly good. The great difference in the estimated temperatures of this star may perhaps be attributed to selective absorption in its atmosphere. In general, it may be said that the figures obtained by both investigators confirm Lockyer's thermal classification, the temperature increasing as we ascend from the red stars of the classes typified by Aldebaran and Antares to the white Sirian and Algolian stars.

THE STRUCTURE OF THE UNIVERSE. Professor Kapteyn delivered an address before the National Academy of Sciences in which he summarized the most modern views on this subject. Taking for convenience a modified form of Secchi's classification of the stars into four spectral classes, in which the fourth type is neglected on account of the paucity of its representatives while the helium stars are removed to form a separate group, he argued that there was much evidence to show that the classification is a natural one, that is, it gives the order in which the stars have been evolved. The youngest or helium stars constitute the first stage of development from primordial matter. Passing from type to type in Secchi's order, we arrive at older and older stars. Stars now of the first type were formerly helium stars, and at some remote period in the past must have been evolved from some primordial matter, which was probably in the form of nebulous matter possessing little internal motion. Hence groups like the Hyades and Ursa Major must at one time have been full of nebulae, although there are no traces of such formations now. The absence of helium stars from Kapteyn's second stream, or cloud, of stars is therefore due to the exhaustion of nebulous matter in the cloud, whereas his first stream, which is rich in such stars, has not yet been exhausted of its nebulous matter, or, if so, only at a very recent period.

A NEW CLASS OF VARIABLE STARS. Many explanations have been offered to account for the fluctuations in brightness which are observed in variable stars. In the case of non-periodic variables, we have in a very few cases a slight but continuous diminution in brightness which is probably due to the slow but steady cooling of the star; or there may be irregular variability, so that the star flashes forth from time to time at irregular intervals. For the latter phenomenon no satisfactory explanation has been found. In the case of periodic variables, however, it has been possible to classify them into long and short period variables. The type of the first class is that star in the constellation of the Whale, which was the first variable to be recognized as such, and to which Hevelius gave the name Mira, or "The Wonderful." Its brightness shows a steady increase followed by a diminution, the cycle of change extending over a somewhat irregular period of about eleven months. The periods

of stars of this type vary from a couple of months to about two years, but the majority resemble Mira in having periods of about a year. Their light changes, when plotted on a chart, give curves resembling those showing sun-spot frequency to such an extent that it is not surprising that astronomers have considered that in these stars there occurs a development of spots which is quite analogous to that which takes place in the sun. It is found that the maxima and minima of light intensity correspond to the maxima and minima of spot numbers, so that it cannot be that the spots cut off the light by diminishing the luminous surface of the star, as was once thought to be the case, but rather that, as in the sun, the occurrence of the spots is associated with a great increase of energy which is made evident by the increase of luminosity. The other class, namely, that of the short period variables, is divided into two groups, typified by Algol and β Lyrae. In these two groups just referred to the variations of luminosity are explained by the presence of two stars in revolution about each other, in such a way that periodical eclipse takes place. In the Algol type, one of the stars is luminous, and the other dark, so that when the dark star is passing in front of the luminous one, there is a brief period during which a diminution of luminosity occurs. In the other type—the β Lyrae type above mentioned—both stars are luminous, but as a rule they are not equally so.

Still another type of periodic variable has recently come to light. Observations made at Princeton during the past two years showed that the light changes of S Antilæ, SZ Tauri, and RU Camelopardalis could be most satisfactorily explained on the hypothesis that they are isolated rotating ellipsoids, and not binary systems. Shapley, in a discussion of a large number of photometric measurements on the third of these stars, arrived at the conclusion that its light variations could be accounted for by supposing it to be a single uniformly illuminated ellipsoidal body rotating in a period of 44,344 days. The discussion of the results for the two other stars is promised and will be awaited with interest.

PRESENT MAGNITUDES OF NOVÆ. Professor Barnard reported his observations on the present magnitudes of many of the "novæ" or temporary stars which have blazed forth during the heavens during the past half century. The constellations in which the stars appeared, and the present magnitude of the stars are given in the subjoined table:

Constellation	Discoverer	Date of discovery	Present magnitude
Corona borealis	Birmingham	1866	9.4
Cygnus	Schmidt	1876	15.0
Andromeda	Hartwig	1885	invisible
Auriga	Anderson	1891	14.0
Sagittarius	Mrs. Fleming	1898	15.0
Perseus	Anderson	1901	12.4
Gemini	Turner	1903	16.0
Aquila	Mrs. Fleming	1905	invisible
Lacerta	Espin	1910	12.5
Gemini	Enebo	1912	8.3

It will be noticed that most of them are now beyond the power of all but the most powerful telescopes, while Nova Andromedæ and Nova Aquilæ have dwindled until they are

of less than the 17th magnitude. The celebrated Nova in Cassiopeia, the appearance of which startled Tycho Brahe in 1592, was also under observation, and was found to be slightly fainter than a star of the eighth magnitude.

MINOR PLANETS. The number of minor planets announced as new each year for the past three years has been comparatively small, but in 1913 it again approached the century mark. Since the issue of the YEAR BOOK for 1912, ninety-two of these bodies had been reported, and have received provisional designations ranging from 1913 QC to 1913 TQ, with 1906 WF and WF. The last two were detected on the reëxamination of some old negatives taken by Kopff at Heidelberg in 1906. The ten planets designated by the letters QC to QM belong strictly to 1912, but were not reported until well into 1913. Six, reported from Heidelberg, were identified more or less completely with bodies previously known; these are QN, doubtfully identified with 396 (Æolia); QO, with 1908 CF; QF, with 584 (1906 SY); QQ, doubtfully with 496 (Gryhia); QV, with 1908 CA; and RA, with 14 (Irene). In addition, QT, reported from Winchester, Mass., proved to be identical with 1909 GU; and two, RF and RM, discovered at Simëis have been identified, the former with 1910 KO, the latter with 1907 AZ and 1909 GG. The total number of minor planets discovered in 1913, and not yet identified with bodies already known, is therefore 82. As usual, the lion's share falls to the observers of the Königstuhl Observatory at Heidelberg, where 23 were found; of these, 17 were discovered by Kaiser, and two each by Wolf, Kopff, and Massinger. This number is followed closely by the twenty-two reported from Winchester, Mass., by the Rev. Joel Metcalf, his total being the largest credited to a single individual during the year. The increased activity in the search for minor planets displayed at the Simëis Observatory resulted in the discovery of 17, of which 13 were found by Neujmin and 4 by Neujmin and Mme. Belawsky jointly. Of the remaining 20, 9 were discovered by Arndt at Neuchatel, 6 by Wood at Johannesburg, 4 at Vienna (3 by Rheden and 1 by Palisa), and one by Pokrowski at Dorpat.

Permanent numbers were assigned to the following minor planets for which definitive elements have been computed:

Number	Temporary designation	Discoverer	Date of discovery
733	PF	Wolf	1912—Sept. 16
734	PH	Palisa	Oct. 11
735	PY	Vogt	Dec. 9
736	PZ	Metcalf	Nov. 16
737	QB	Metcalf	Dec. 7
738	QO	Kaiser	1913—Jan. 7
739	QR	Metcalf	Feb. 7
740	QS	Metcalf	Feb. 10
741	QT	Metcalf	Feb. 10
742	QU	Kaiser	Feb. 23
743	QV	Kaiser	Feb. 25
744	QW	Rheden	Feb. 26
745	QX	Kaiser	March 1
746	QY	Kaiser	March 1
747	QZ	Metcalf	March 7
748	RD	Neujmin	March 14
749	RF	Neujmin	April 5
750	RG	Palisa	April 28
751	RK	Neujmin	April 28
752	RL	Neujmin	April 30
753	RM	Neujmin	April 30
754	UT	Kopff	1906—Aug. 22

In a communication to the *Astronomische Nachrichten*, Dr. Fritz Cohn called attention to the inconvenience and the possibility of confusion connected with the literal designation of the minor planets, and suggested the advisability of naming as many as possible. He therefore submitted a list of feminine names, chosen mainly from mythology and history, to the discoverers, and, with their approval, published a set of names for all the previously unnamed planets from 570 (1905 QX) to 727 (1912 NT). The names assigned show a striking catholicity of taste, and, in some cases, obvious appropriateness; for example, 697 is named Galilea on account of its having been discovered on the 300th anniversary of Galileo's discovery of the satellites of Jupiter, and in the name Melitta assigned to 676, one is inclined to suspect a play on the name of the discoverer, Melotte. In another paper, Dr. Cohn emphasized the necessity of more systematic observation of newly discovered planets, and increased coöperation in such work. Some are observed repeatedly at opposition after opposition, but many discovered at the more remote observatories fail to receive attention, and consequently there is delay in obtaining the necessary data for the computation of their orbits.

COMETS. The periodic comets due to return in 1913 were Westphal's (1852 IV.), Finlay's (1886 VII.), Holmes's (1892 III.), Swift's (1894 IV.), and Kopff's (1906 IV). Of these, Westphal's only was discovered. It was first detected by Delavan at the La Plata (Argentina) Observatory on September 26. It is the fourth member of the group of long period comets associated with the planet Neptune to be observed at a second appearance, the others being the comets of Halley, Pons, and Olbers. Westphal's comet has a shorter period—61.12 years—than any other member of the group; its last perihelion passage occurred on October 12, 1852. When first seen at this apparition, it was of the tenth magnitude, and had a distinct nucleus and a broad tail about 4° long. It gained slightly in brightness at first, but never became a naked-eye object. It passed through perihelion on November 26.

Finlay's comet, discovered at the Cape of Good Hope in 1886, was due at perihelion on March 24, but as it passed very close to Jupiter during the summer of 1910, it was expected that its period would be shortened so as to bring it to perihelion about six weeks earlier. As it would have been behind the sun at that time, it may have failed of detection on account of its unfavorable position. It was observed in 1893 and 1906.

Holmes's comet, with a period of 6.86 years, was due to return to perihelion in January, but it was not favorably placed for observation and escaped detection, although it has been seen at each return since its discovery in 1892.

Besides Westphal's comet, another periodic—Giacobini's (1900 III.)—reappeared. It was discovered by Zinner on October 23. For some as yet undiscovered reason, it was six months ahead of time, so that its period, originally estimated at 6.76 years, has apparently been shortened to 6.44 years. It passed through perihelion on November 2. Since the last issue of the YEAR BOOK, five other comets have been reported. These are:

1912 d, discovered on December 31, 1912, by Lowe at Laura, South Australia. Owing to delay in announcing its discovery, and an error in its position, as originally given, it could not be found again, and no data were available for the computation of its orbit.

1913 a, discovered by Schaumasse at Nice on May 6. It passed through perihelion on May 15.

1913 b, discovered by Metcalf at South Hero, Vermont, on September 1. It was a faint object of about the tenth magnitude, and was thought at first to be Westphal's comet, as it was situated very near the place where that comet was expected.

1913 c, discovered by Neujmin at Simëis on September 3, had a stellar nucleus, and was at first thought to be a minor planet. Its envelope underwent a series of curious changes, alternating between visibility and invisibility. Early in October, the comet could no longer be found. It passed through perihelion on September 23. Its orbit was found to be elliptical, with a period of about nine years.

1913 f, discovered by Delavan at La Plata on December 17. It should pass through perihelion on March 2, 1914.

STANDARD TIME. Brazil has now adopted standard time. For this purpose, the country is divided into four zones, in the most easterly of which the legal time will be reckoned two hours slow on Greenwich. This zone includes the islands of Fernando Noronha and Trinidad (Brazilian). The second zone includes the eastern portion of the mainland, and extends to the River Xingu, which, coinciding roughly with the meridian of 52½° west of Greenwich, forms its western boundary. The third zone takes in the western half of Brazil with the exception of the extreme western portion of the state of Amazonas, the territory of Acre, and the other territory ceded by Bolivia under the terms of the treaty of Petropolis which was signed in 1903.

OTHER EVENTS. The Bruce medal of the Astronomical Society of the Pacific was awarded to Professor J. C. Kapteyn of Groningen, in recognition of his services to astronomy in the study of the proper motions of the stars. The Canadian government made the necessary appropriation for the establishment of an observatory, which, it is expected, will be located at some place in the Canadian Rockies. The observatory is to be equipped with a 75-inch reflecting telescope, which will be second only in size to the 100-inch instrument now in process of construction for the Mount Wilson Solar Observatory.

BOOKS. Among the more important works on Astronomy published in 1913 may be mentioned: Campbell, *Stella Motions* (New Haven); Heath, *Aristarchus of Samos, The Ancient Copernicus* (Oxford); Jacoby, *Astronomy* (New York).

ATHLETICS, TRACK AND FIELD. The year 1913 was a memorable one in athletics. The Olympic games of 1912 had served to stimulate a world-wide interest in track and field events,

and countries which had never before paid much attention to these branches of sport began the development of teams to represent them in the Olympic meet to be held in Berlin in 1916.

In the United States eight names stand out prominently. John Paul Jones, the Cornell runner, wound up his remarkable career as an athlete by lowering his world's record time for the mile to 4 minutes 14½ seconds in the Harvard stadium. Hannes Kolehmainen, the Finn, who had distinguished himself in the Olympic games and who now represents the Irish-American A. C. of New York, broke every American outdoor record from 3½ up to 10 miles in the ten-mile championship run of the A. A. U., J. L. Wendell of Wesleyan University equaled the world's record of 23¾ seconds for the 220-yard dash low hurdles in the Harvard Stadium. J. E. Meredith of the University of Pennsylvania broke the 600-yard run indoors by covering the distance in 1 minute 13¾ seconds. F. W. Kelly, of the University of Southern California, equalled the world's record of 15½ seconds for the 120-yard high hurdles, held by A. B. Shaw. Patrick Ryan of the Irish-American A. C. established two new marks with the hammer. He threw the sixteen-pound hammer 189 feet 3 inches, and the twelve-pound hammer 213 feet 9½ inches. Leo Gehring of the Mohawk A. C., New York, set a new record for the standing high jump—5 feet 5¾ inches. A. R. Kiviat ran the mile indoors in 4 minutes 18¾ seconds.

The senior championships of the A. A. U. were held at Chicago, July 5, the Irish-American A. C. winning for the fourth successive year with a total of 44 points. The Chicago A. A. was second with 27 points. Other teams entered and their scores were: Boston A. A., 21; New York A. C., 18; Illinois A. C., 13; Missouri A. C., 11; Springfield High School, 10; University of Southern California, 8; Mohawk A. C., 5; unattached, 2; Kansas City A. C., 2; Long Island A. C., 1. In the junior championships the Chicago A. A. was victor, its score being 42. The Irish-American A. C. was second with 22 points, and the New York A. C. third with 19 points. The all-round championship was won by F. C. Thompson of Princeton University with 7418½ points. Thompson, earlier in the year, made a new world's record in this event, scoring a total of 7499 points. The senior indoor championships were won by the Irish-American A. C. (30), with the New York A. C. (25) second, and the Boston A. A. (13) third. In the junior events the Irish-American A. C. (22) finished first, the New York A. C. (20) second, and the Long Island A. C. (8) third.

The thirty-eighth annual track and field meet of the I. C. A. A. was held in the Harvard Stadium at Cambridge, Mass., May 30-31. John Paul Jones of Cornell was the only athlete to create a new record—4 minutes 14¾ seconds for the mile. The University of Pennsylvania won the championship, scoring a total of 24 points. Harvard was a close second with 21½ points. The standing of the other colleges was: University of Michigan, 19; Cornell, 17½; Dartmouth, 14½; Yale, 10½; California, 10; Wesleyan, 10; Princeton, 6; Columbia, 4; Brown, 3; Pennsylvania State, 1.

The University of Illinois won the annual

games of the conference colleges of the West held at Madison, Wis., June 6-7, scoring 47½ points. The University of Wisconsin finished second with 28½ points, and the University of Chicago third with 17½ points. California, the 1912 winner, was fourth with 15 points. Other scores were: Missouri, 14½; Northwestern, 9½; Minnesota, 8; Purdue, 8; Ohio State, 4; Iowa, 3½; Kansas, 3; Notre Dame 2.

In the New England intercollegiate championships held at Cambridge, Mass., May 24, Dartmouth won for the second successive year, scoring 20 points. The New York intercollegiate championships were won by Colgate with 69½ points. The more important dual college meets resulted as follows: Yale 56, Harvard 48; Yale 60½, Princeton 56½; Princeton 79½, Columbia 37½; Harvard 63, Cornell 54; Michigan 55½, Syracuse 21½; and Michigan 80, Syracuse 42; Southern California 62, Stanford 60; Southern California 67, California 55; Missouri 88, Minnesota 20½; Johns Hopkins 60, Naval Academy 28; Pennsylvania 64, Virginia 35; Stanford 61½, California 60½; Wisconsin 93, Ohio State 33; Rutgers 64, Swarthmore 48; Haverford 64½, New York University 39½; Williams 64, Wesleyan 62; Cornell 85, Michigan 32; Maine 71, Trinity 55; U. S. Naval Academy 76, Dickinson 9; Syracuse 80½, Brown 36½; Lehigh 72½, Bucknell 38½; Rutgers 72, New York University 33; Brown 68, Wesleyan 58; Dartmouth 70½, Pennsylvania 46½; Amherst 76½, Williams 49½; Bowdoin 74, Trinity 52; Bates 68, Maine 58; Illinois 86, Purdue 31; Swarthmore 67½, Lafayette 44½; Lehigh 71½, Haverford 39½; Chicago 74, Northwestern 52; U. S. Naval Academy 57½, Georgetown 27½; Notre Dame 96, Northwestern 30; Purdue 87, Indiana 30; Missouri 62, Kansas 47; Union 61, Hamilton 56; Lehigh 72, Swarthmore 40; Illinois 78½, Chicago 47½; Wisconsin 108, Minnesota 18; Andover 40, Exeter 40.

The English championships were held at Stamford Bridge, London, July 4. W. R. Applegate made the best individual showing, winning both the 100 and the 220-yard dashes. A team of Swedish athletes competed, capturing several events. The Oxford-Cambridge dual meeting resulted in a tie, each college scoring five firsts.

AUCKLAND ISLANDS. A dependency of New Zealand (q.v.)

AUGUSTE, TANCREDE. President of Haiti, died May 3, 1913. He succeeded Cincinnatus Leconte as president of the republic on August 9, 1912. See HAITI.

AUSTIN, ALFRED. The British poet laureate, died June 2, 1913. He was born at Headingley, Leeds, in 1835. His father was a merchant. Educated at Stonyhurst and at London University, he graduated from the latter institution in 1853; then studied law, and in 1857 became a barrister of the Inner Temple. On the death of his father in 1861 he gave up the law and devoted himself to foreign travel and to literary work. His first published book of verse, *The Seasons: a Satire*, appeared in 1861, and was followed, between that date and 1902,

by other poetical works, including *The Golden Age*; *Interludes*; *Madonna's Child*; *The Tower of Babel*; *The Human Tragedy*; *Savoranola*; *Lyrical Poems*; *Narrative Poems*; *Prince Lucifer*; *Alfred the Great*; *England's Darling*; *A Tale of True Love* (1902); *Flodden Field* (1903); *The Door of Humility* (1906); *Sacred and Profane Love* (1908); and *Love Poems* (1911). Mr. Austin's poetry except in rare instances had never risen much above mediocrity and his appointment as poet laureate by Queen Victoria in 1896 created not a little surprise and considerable amusement. He was handicapped from the beginning by the fact that Lord Tennyson had been his predecessor in the post. It was generally considered that either Swinburne or Kipling was far better fitted for poet laureate than Austin. He industriously performed the duties of his office and undertook the task of writing odes suggested by imperial incidents, the winning of a battle, the death and succession of a ruler, and other events of national interest. Although his poems breathed a spirit of patriotism, they were not considered to rank high as poetry.

He was critic as well as poet, and in his *Poetry of the Period* (1870) was extremely severe on Swinburne, Tennyson, William Morris, Matthew Arnold, and Browning. He went so far as to declare that in his opinion Tennyson would not even be at the head of the poets of the third rank. He wrote much for the *Standard* and the *Quarterly Review*. The former he represented as a special correspondent at the sittings of the Ecumenical Council at the Vatican, and at the headquarters of the king of Prussia in the Franco-Prussian War. In 1883, with W. J. Courthope, he founded the *National Review*, which he continued to publish until 1893. Among his prose works are: *The Garden That I Love*; *In Veronica's Garden*; *Lamia's Winter Quarters*; *Spring and Autumn in Ireland* (1900); *Haunts of Ancient Peace* (1902); *A Lesson in Harmony* (1904); *The Bridling of Pegasus* (1910); and *Autobiography* (1911).

AUSTRALIA, COMMONWEALTH OF. A self-governing dominion of the United Kingdom, from January 1, 1901. It consists of the states of New South Wales, Victoria, Queensland, South Australia, Western Australia, and Tasmania, and the Northern Territory, and the Federal Capital Territory. The temporary seat of the federal government is Melbourne, capital of Victoria. The permanent capital (see ARCHITECTURE) will be Canberra, founded in 1913, in the Federal Capital Territory, which lies within the state of New South Wales.

AREA AND POPULATION. The estimated area and the population according to the census of March 31, 1901, and April 3, 1911, are as follows:

	Sq. m.	Pop. '01	Pop. '11
New South Wales...	309,460	1,354,848	1,646,734
Victoria	87,884	1,201,070	1,315,551
Queensland	670,500	498,129	605,813
South Australia....	380,070	358,346	408,558
Western Australia..	975,920	184,124	282,114
Tasmania	26,215	172,475	191,211
Northern Territory..	523,620	4,811	8,310
Federal Capital Ter.	912	1,714
Commonwealth	2,974,581	3,778,801	4,455,005

* Including population of the present Federal Capital Territory.

The Australian census returns do not include full-blooded aborigines. However, the full-blooded aborigines regarded as civilized or semi-civilized, that is, those who were in the employ of whites or were living in contiguity to the settlements of whites, were enumerated, numbering in 1911, 19,939. The total number of aborigines is unknown. It has been generally supposed that there are about 150,000, but this figure now appears to be excessive. In his 1910 report the Queensland chief protector of aborigines estimates the total at 74,753, distributed as follows: New South Wales, 6897; Victoria, 256; Queensland, 20,000; South Australia (including the Northern Territory), 20,000; Western Australia, 27,000. A somewhat similar estimate, made by a former chief protector of aborigines in Queensland, gave Queensland at least 18,000, Western Australia at least 24,000, and the Northern Territory from 20,000 to 22,000. In view of these figures it would appear that the number of aborigines is not more than 100,000.

The 1911 census returned 2,313,035 males and 2,141,970 females, or 107.99 males per 100 females. Classification by occupation in 1911: Professional, 144,611; domestic, 201,366; commercial, 286,687; transport and communication, 157,391; industrial, 562,337; primary producers, 586,148; indefinite (of independent means), 23,055; dependents, 2,449,986 (including 2,441,047 dependent on natural guardians, 8587 supported by voluntary and state contributions, and 352 criminals under legal detention); unspecified, 43,424.

A feature of the distribution of population in Australia is the excessive tendency to accumulate in towns, especially the capital cities. In 1911 the population of Sydney, N. S. W., and its suburbs that is, approximately the area within a ten-mile radius) was 629,503, or 38.19 per cent. of the total population of the state; Melbourne, Vict., 588,971, or 44.82 per cent.; Brisbane, Qld., 139,480 or 23.03 per cent.; Adelaide, S. Aust., 189,646, or 46.06 per cent.; Perth, W. Aust.; 106,792, or 37.86 per cent.; Hobart, Tas., 39,937, or 20.87 per cent. Thus the total metropolitan population was 1,694,329, or 38.05 per cent. of the population of the commonwealth. The total increase from 1901 to 1911 was 681,204 (18.05 per cent.), of which the metropolitan increase was 357,751 and the increase in the rest of the country 323,453; and most of the increase shown by the latter figure was in towns rather than rural districts. Many rural counties showed a decrease from 1901 to 1911.

Figures for the population of Australian towns and cities are confusing, because they often relate to different areas. A population figure may include the inhabitants of the town proper and of its suburbs, persons living within a ten-mile or sometimes a five-mile radius; it may relate to the "locality," in which case no clearly defined boundaries exist and the population given represents the number of persons who returned themselves as belonging to that locality; again, it may relate to the "local government area," or the district incorporated for municipal purposes and variously known in the several states as city, town, borough, municipality, and corporation. Thus, according to the census of 1911, the population of Sydney with suburbs was 629,503; the "locality" Sydney,

107,133; "the local government area" (city) Sydney, 112,021. The following figures show for other large places the 1911 population by locality and local government area respectively: Melbourne, Vict., 36,293 and 103,593; Melbourne South, Vict., 46,016 and 46,190; Ballarat, Vict., 38,686 and 22,017; Richmond, Vict., 38,559 and 40,442; Fitzroy, Vict., 34,141 and 34,283; Sydney North, N. S. W., 32,764 and 34,646; Adelaide, S. A., 32,981; Brunswick, Vict., 32,201 and 32,215; Balmain, N. S. W., 31,961 and 32,038; Perth, W. A., 31,300 and 35,767; Broken Hill, N. S. W., 30,953 and 30,972; Hobart, Tas., 27,550 and 27,526; Carlton, Vict., 27,476, not a local government area; Newtown, N. S. W., 26,427 and 26,498; Marrickville, N. S. W., 25,093 and 30,653; Prahran, Vict., 25,489 and 45,367; St. Kilda, Vict., 25,449 and 25,334; Redfern, N. S. W., 24,275 and 24,427; Hawthorn, Vict., 24,353 and 24,450; Paddington, N. S. W., 24,150 and 24,317; Leichhardt, N. S. W., 24,139; Footscray, Vict., 21,933 and 24,254; Geelong, Vict., 21,630 and 13,618; Glebe, N. S. W., 21,444 and 21,943; Brisbane South, 21,332 and 34,478; Launceston, 20,937 and 20,754; Petersham, N. S. W., 20,407 and 21,712; Collingwood, Vict., 20,254 and 34,190; Waverly, N. S. W., 18,961 and 19,831; Bendigo, Vict., 17,883 and 28,530; Melbourne North, Vict., 17,750, not a local government area; Brisbane, Qld., 17,715 and 35,491; Northcote, Vict., 17,491 and 17,519; Toowoomba, Qld., 16,161 and 13,119; Randwick, N. S. W., 15,793 and 19,463; Rockhampton, Qld., 15,451 and 15,456; Malvern, Vict., 15,319 and 15,969; Charters Towers, Qld., 15,037 and 4,262; Townsville, Qld., 13,678 and 10,636; Kalgoorlie, W. A., 13,488 and 12,061; Port Melbourne, Vict., 13,471 and 13,515; Boulder, W. A., 12,833 and 10,824; Woolahra, N. S. W., 12,816 and 16,989.

The increase of population in Australia has been far more due to excess of births over deaths than to immigration. In the period 1861-1911, the excess of arrivals over departures was 876,099, while the excess of births over deaths was 2,547,023; that is, 25.59 per cent. of the gain in population was due to net immigration and 74.41 per cent. to natural increase. Net immigration in 1911 was 69,300; in 1912, 83,741 (166,958 arrivals and 83,217 departures), of whom 48,050 were credited to New South Wales, 22,252 to Victoria, and 6594 to Western Australia. Excess of births over deaths in 1911 was 74,324; in 1912, 80,911. The birth rate per thousand in 1912 was 28.65; marriage rate (rate of marriages, not persons married), 9.07; death rate, 11.23. The percentage of illegitimate to total births in 1910 was 5.75 and in 1911, 5.79. Estimated population (exclusive of full-blooded aborigines) December 31, 1911, 4,568,707; December 31, 1912, 4,733,359. The latter figure was composed as follows: New South Wales, 1,777,534; Victoria, 1,380,561; Queensland, 636,425; South Australia, 430,090; Western Australia, 306,129; Tasmania, 197,205; Northern Territory, 3475; Federal Capital Territory, 1940.

The Northern Territory, under the jurisdiction of South Australia from 1863, was transferred to the commonwealth January 1, 1911. In 1905 the commonwealth assumed the administration of Papua (q.v.). The Federal Capital Territory, including a small area at Jervis Bay, was taken over by the commonwealth from New South Wales, January 1, 1911. The site

for the new federal capital is 204 miles distant from Sydney, 429 from Melbourne, 912 from Adelaide, and 929 from Brisbane. In 1912 the design for the laying out of the capital city was approved, and in 1913 the survey and other operations, including roads and engineering works, was being carried forward. A survey for the federal railway between Jervis Bay and the capital was in progress. On March 12, 1913, the official ceremony to mark the initiation of operations in connection with the establishment of the seat of government was carried out. Foundation stones were laid by the governor-general, the prime minister, and the minister for home affairs. At the ceremony the selection of *Canberra* as the name of the capital city was announced by Lady Denman, wife of the governor-general.

EDUCATION. According to the 1911 census, persons able to read and write English numbered 3,650,030; read only, 15,009; read and write a foreign language only, 26,210; read only, 2647; not stated, 95,727; unable to read, 665,382. Of the latter number, 525,633 were under five years of age and 76,300 from five to nine years. Of persons aged twenty and upwards only about 2¼ per cent. were unable to read. In respect of children six to thirteen years of age, the census returned the number being educated at state schools (primary and secondary inclusive) as 496,163 (257,609 male, 238,554 female); at private schools, 106,663 (48,583 and 58,080); at home, 17,151 (7720 and 9431); number recorded as "scholar," but class of school not stated, 15,708 (7917 and 7791); number not indicated as receiving instruction, 64,426 (31,669 and 32,757); total, 700,111 (353,498 and 346,613). Public instruction is under control of the states. Primary instruction is free and compulsory. The following statistics for the total commonwealth and the several states relate to 1911:

	Cmlth.	N. S. W.	Vic.
State schools.....	8,083	3,125	2,061
State teachers.....	16,971	5,980	5,155

Expenditure:				
Maintenance..	£351,942	£198,979	£187,801	£87,317
Building	£ 53,953	£ 35,581	£ 58,406	£16,548
Private schools	141	176	123	114
Priv. teachers.	729	665	421	349
Enrollment	16,100	11,650	9,000	7,133
Av. attendance	13,560	9,895	8,015	5,009

In the foregoing table the figures for the commonwealth include those for the Northern Territory, which had four schools, with 135 pupils enrolled. Private schools include the schools not wholly under state control; hence the term "private," though popularly applied, is in some degree a misnomer. There are various superior

and technical schools. The number of students attending lectures at the universities in 1911 are reported as follows: Sydney, 1407; Melbourne, 1129; Adelaide, 621; Tasmania, (Hobart), 147; Queensland (Brisbane), 83.

MINERALS. The large mineral production of Australia is now considerably less than the agricultural or the pastoral. The following table shows the value of the most important minerals, and the total for all minerals, produced in 1911, and the grand total of production from the beginning of mining in Australia to the end of that year (the totals, however, are exclusive of returns relating to building stone, sand, brick clays, lime, cement, slates, etc.):

	Gold £	Coal £	Copper £	*Sil.-ld. £

* Silver and lead.

To the end of 1911 the total output of gold, the most important mining product, was valued at £536,106,981. The value of the 1912 output was £9,879,927, as compared with £16,204,684 in 1903, the record year for Australian gold production. The output in 1902, 1907, and 1912 and the total production to the end of 1912 are shown below:

	1902 £	1907 £	1912 £	Total £
N. S. W.	684,970	1,165,013	702,129	59,462,975

Cmlth.	14,811,947	15,550,910	9,879,927	546,076,908

The record of gold mining begins for New South Wales and Victoria with 1851, Queensland 1860, South Australia 1856, Western Australia 1886, Tasmania 1867, and the Northern Territory 1881. The greatest outputs of gold have been: New South Wales, £2,660,946 in 1852; Victoria, £12,214,976 in 1856; Queensland, £2,871,578 in 1900; South Australia, £76,025 in 1904; Western Australia, £8,770,719 in 1903; Tasmania, £327,545 in 1899; Northern Territory, £111,945 in 1881. In the period 1902-

1911 Western Australia was credited with 53.53 per cent. of the gold production, Victoria, 21.07, Queensland 16.26, and New South Wales 6.94.

AGRICULTURE. In the year 1911-12, the areas under crop and under artificially sown grasses respectively were 12,107,017 and 2,869,866 acres, as compared with 11,893,838 and 2,714,691 in 1910-11, and 8,414,054 and 1,007,115 in 1901-02. Share of the states in the 1911-12 acreage: New South Wales, 3,628,513 acres under crop and 1,119,738 under artificially sown grasses; Victoria, 3,640,241 and 1,041,772; Queensland, 528,388 and 166,175; South Australia, 2,965,338 and 30,431; Western Australia, 1,072,653 and 5760; Tasmania, 270,000 and 505,940; Federal Capital Territory, 3500 and 50; Northern Territory, 375 and 18. A very large part of the hay crop is cereal grasses, chiefly wheat and oats; of the 860,205 acres of hay in Victoria, 304,388 were wheaten and 555,146 oatens. The area under barley in 1911-12 was 116,466 acres, and the yield 2,056,836 bushels; potatoes, 130,463 acres and 301,489 tons. Crop values for the commonwealth in 1911-12 (exclusive of value of straw in the case of cereal crops): Wheat, £13,303,326 (£1 7s. 10d. per acre); oats, £1,463,780 (£2 7s. 6d.); corn, £1,637,692 (£4 16s. 4d.); barley, £483,151 (£4 3s.); potatoes, £2,296,797 (£17 12s. 1d.); hay, £10,288,960 (£3 11s. 9d.); green forage, £1,217,000 (£2 17s. 4d.). The area under sugar cane in 1911-12 was 144,283 acres, of which Queensland had 95,766 acres of productive and 34,610 acres of unproductive cane, and New South Wales 5244 and 8663. Total yield of cane, 1,682,250 tons; sugar, 187,761 tons, of which 17,299 in New South Wales and 170,462 in Queensland (18,828 and 207,182 in 1910-11). Area and production of the leading crops in 1911-12:

	Wheat Acres	Bu.	Oats Acres	Bu.

LIVESTOCK. The average annual increase from 1860 to 1911 was: Horses, 3.32 per cent.; cattle, 2.17; sheep, 3.15; swine, 2.38. The numbers of livestock attained their maxima as follows: Horses in 1911, 2,279,027; cattle in 1894, 12,311,617; sheep in 1891, 106,421,068;

swine in 1911, 1,110,721. Livestock in 1911 were as follows:

	Horses	Cattle	Sheep	Swine
N. S. W.	687,242	3,185,824	44,722,523	370,700
Victoria	507,813	1,647,127	13,857,804	348,069
Queensl'd	618,954	5,073,201	20,740,981	173,902
S. Aust.	259,719	393,566	6,171,907	93,130
W. Aust.	140,277	843,638	5,411,542	55,635
Tasmania	41,853	217,406	1,823,017	67,392
N. Ter.	21,407	459,780	50,983	1,500
F. C. Ter.	1,762	8,412	224,764	393
Cmlth.	2,279,927	11,828,954	98,008,521	1,110,721
1910	2,165,866	11,744,714	92,047,015	1,025,850
1901	1,620,420	8,491,428	72,040,211	931,309

The cattle (including calves) slaughtered in 1911 numbered 1,545,548, compared with 1,363,074 in 1910 and 1,110,157 in 1901; sheep (including lambs), 14,267,327, compared with 15,679,915 and 8,972,169. Australia has more sheep than any other country in the world. The estimated wool production, stated as in the grease, was 768,572,533 pounds in 1911, against 792,868,466 pounds in 1910 and 600,139,012 pounds in 1907. More than half of the wool is produced in New South Wales.

MANUFACTURES. A manufactory in Australia is defined as any factory, workshop, or mill where four or more persons are employed or power is used. The following table shows for 1911 the number of manufactories, the average number of employes, salaries and wages paid (exclusive of amounts drawn by working proprietors), and value of output (including the value of raw materials used):

	Mft.	Empl.	Wages	Output
N. S. W.	5,039	108,684	£10,061,161	£ 54,340,011
Victoria	5,126	111,948	8,911,019	41,747,863
Queensl'd	1,657	37,156	3,113,835	15,675,662
S. Aust.	1,814	27,907	2,645,388	12,580,851
W. Aust.	710	15,799	1,982,883	5,311,086
Tasmania	609	10,298	827,592	3,525,087
Cmlth.	14,455	311,772	£27,531,876	£133,186,560
1910	13,852	286,963	£23,870,540	£120,860,158
1907	12,555	248,859	18,323,977

The difference between the value of total output and raw materials used was £54,144,084 in 1911 and £48,063,922 in 1910.

COMMERCE. The recent development of Australian commerce may be seen in the following table, which shows: Total exports; domestic exports, or exports of Australian produce; re-exports, or exports of foreign produce; total exports:

	Tot. Imp.	Dom. Exp.	Re-exp.	Tot. Exp.
1901...	£42,433,811	£47,741,776	£1,954,396	£49,696,172
1906...	44,744,912	66,299,874	3,437,889	69,737,763
1910...	60,014,351	71,836,195	2,654,955	74,491,150
1911...	66,967,488	76,205,210	3,277,048	79,482,258

Specie and bullion included in above figures:

1901...	£ 934,864	£14,433,398	£ 846,921	£15,270,219
1906...	2,330,017	15,584,836	2,125,097	17,709,933
1910...	1,331,960	2,587,201	1,048,076	4,635,277
1911...	1,969,581	10,403,796	1,643,290	12,047,086

The table below shows imports and exports according to the official classification: *a* animal foodstuffs, etc.; *b* vegetable foodstuffs, etc.; *c* non-alcoholic beverages; *d* spirits and alcoholic liquors; *e* tobacco; *f* live animals; *g* ani-

mal non-foodstuff substances; *h* vegetable substances and non-manufactured fibres; *i* apparel, textiles, and various manufactured fibres; *j* oils, fats, and waxes; *k* paints and varnishes; *l* stones and minerals, used industrially; *m* specie; *n* metals (unmanufactured) and ores; *o* metals (partly manufactured); *p* metals (manufactured), including machinery; *q* leather and rubber and their manufactures; *r* wood and wicker, both raw and manufactured; *s* earthenware, stoneware, china, glass, and cements; *t* paper; *u* jewelry, timepieces, and fancy goods; *v* optical, surgical, and scientific instruments; *w* drugs, chemicals, and fertilizers; *x* miscellaneous; *y* total. Trade by classes, in 1910 and 1911, in thousands of pounds sterling:

	Total Imp.		Dom. Exp.		Total Exp.	
	1910	1911	1910	1911	1910	1911

Wool exports in 1910 and 1911 respectively were: Wool in grease, 587,093,269 pounds and 578,823,623 pounds; scoured and washed wool, 78,178,300 pounds and 71,770,640 pounds; total value for the two years £28,777,283 and £26,071,103 (total value for the five years ended 1911, £132,137,652). The values of the net exports of wool in 1910 and 1911 were £28,769,504 and £26,061,687. Other net exports of pastoral products in 1910 and 1911 were: Tallow, £1,888,796 and £1,934,009; frozen mutton and lamb, £2,161,495 and £1,633,597; sheepskins, £2,003,810 and £1,603,718; frozen beef, £1,179,060 and £1,101,914; rabbit and hare skins, £566,739 and £498,037; hides, £286,274 and £467,304; preserved meats, £802,880 and £756,148; rabbits and hares, £486,592 and £407,034. The wheat exports in the two years were 47,761,895 bushels and 55,147,840 bushels; flour, 139,946 tons and 175,891 tons, representing 6,997,300 bushels and 8,794,550 bushels; so that the total wheat exports expressed in bushels were 54,759,195 and 63,942,390, the net exports being 54,750,270 and 63,930,127.

Total imports and total exports by countries in 1910 and 1911 were valued as follows in thousands of pounds sterling:

	Imports		Exports	
	1910	1911	1910	1911
United Kingdom.....	36,646	39,499	37,698	35,310
United States.....	6,495	7,748	1,599	1,464
Germany	3,779	4,437	7,340	6,643

	Imports		Exports	
	1910	1911	1910	1911

Sweden	361	539	2	2
Total, incl. other.	60,014	66,967	74,491	79,482

Total imports from the United Kingdom and British possessions in 1910 and 1911 were valued at £44,512,090 (74.17 per cent.) and £48,111,453 (71.84 per cent.); exports thereto, £46,021,798 (61.78) and £51,135,433 (64.33).

Over-sea shipping entered and cleared at the ports in 1911, 4174 vessels, of 9,984,801 tons, as compared with 4048 vessels, of 9,333,146 tons, in 1910; 4028 vessels, of 8,541,991 tons in 1901; 3719, of 5,894,173 tons in 1900.

COMMUNICATIONS. The table below shows the railway mileage, exclusive of sidings and cross-overs, of a government railways, b private railways open for general traffic, c total open for general traffic, d private lines used for special purposes only; e grand total. The figures relate chiefly to 1912, those for the government railways being of June 30, 1912, private railways for general traffic December 31, 1911, and private railways for special purposes December 31, 1910.

* Including the mileage (473) of the Port Augusta-Oodnadatta line leased to the South Australian government by the commonwealth government January 1, 1911.

Government railways under construction June 30, 1912, 3161 miles (of which 1596 in Queensland and 671 in New South Wales); authorized, 1310 miles (617 and 221). Construction of the transcontinental (Port Augusta-Kalgoorlie) line was begun in September, 1912. The route, via Tarcoola, is 1063 miles in length and the estimated cost of the lines, including equipment, is £3,988,000. The cost of construction and equipment of the 16,898 miles of government railway to June 30, 1912, was £160,557,160, or £9502 per mile open for traffic. For the year ended on that date the gross earnings were £19,101,000; total working expenses, £12,471,000; percentage of working expenses to gross earnings, 65.29, as compared with 61.94 in 1910-11 and 67.92 in 1901-2.

Telegraphs (exclusive of railway telegraphs), December 31, 1911: Lines, 44,013 miles; wire, 97,053 miles; offices, 4041. The total length of line in New South Wales was 15,057 miles; Victoria, 4055; Queensland, 10,568; South Australia, 5713; Western Australia, 6914; Tasmania, 1706. Under an act of 1905 the post-master-general is empowered to establish wireless telegraphy stations. Up to the end of 1912

approval was given for the erection of nineteen stations at or near the following localities: Port Moresby (Papua), Thursday Island, Cooktown, Townsville, Rockhampton, Brisbane, Sydney, Gabo Island, Melbourne, Hobart, Mount Gambier, Adelaide, Esperance, Perth, Geraldton, Broome, Roeburne, Wyndham and Darwin. It is intended eventually to increase the number to thirty-two.

The number of post offices and receiving offices increased from 4994 and 1393, respectively, at the end of 1901 to 5506 and 2328 in 1910 and 5664 and 2390 in 1911. Of the post offices at the end of 1911, New South Wales had 1948, Victoria 1720, Queensland 576, South Australia 662, Western Australia 372, and Tasmania 386.

In 1912 the 1061-mile line of the Trans-Australian railway was begun, and during 1913 contracts were let and material collected for the vigorous prosecution of the work. Fills, cuts, gradings, etc. were in active construction and road-bed and other material were being assembled along the route. A section from Port Augusta, at the eastern end of Euro Bluff, was put under way. Construction problems attending this great enterprise were of unusual interest, as the various states of the commonwealth were participating actively in the work. Of the 700 miles of rails contracted for, 12,666 tons were being manufactured in Australia and the state of Western Australia itself was a contractor for a large quantity of the sleepers. The state of New South Wales undertook the construction of the commonwealth line from Queanbeyan to the new federal capital. Surveys made of the north and south transcontinental connection brought out the curious fact that its length, 1061 miles, was exactly the same as the east and west lines, and further, that its construction would not be attended with serious difficulties.

FINANCE. The following table shows the commonwealth revenue and expenditure in fiscal years ended June 30:

Revenue, 1912		Expenditures, 1912	
Customs	£12,071,434	Posts	£ 4,330,896
Excise	2,638,702	Treasury	2,308,506
Posts	3,916,254	Defense	2,128,649
Land tax....	1,366,457	Customs	1,024,389

* Including other items.

Of the treasury expenditure in 1912, £2,143,212 was for invalid and old-age pensions; of the trade and customs expenditure, £301,278 for ordinary customs and £543,503 for sugar bounties. The first commonwealth indebtedness was contracted at the beginning of 1911, when the federal government assumed the outstanding liabilities of the Northern Territory and the Port Augusta-Oodnadatta railway. These debts on June 30, 1912, amounted to £3,431,836 and £2,240,011 respectively; in April, 1912, a loan of £700,000 was issued; total debt, £6,71,847.

The consolidated revenue, and the expenditure from consolidated revenue funds of the states, for the year ended June 30, 1912, and the state outstanding debts at that date were as follows:

	Revenue	Expend.	Debt
N. S. W.....	£15,776,816	£15,277,001	£100,052,635
Victoria	10,009,796	9,999,342	60,737,216
Queensland	5,989,347	5,965,692	47,068,186
S. Australia...	4,450,739	4,450,739	* 31,680,124
W. Australia...	3,966,673	4,101,082	26,283,523
Tasmania	1,084,663	1,064,725	11,302,411
Total	41,278,034	40,858,581	277,124,095
1911	37,365,653	37,249,315	267,127,283
1910	36,956,812	35,373,254	257,623,663
1909	34,457,640	33,983,842	251,773,533
1908	34,867,646	32,502,163	243,835,489
1903	28,672,622	28,959,238	222,871,765

* Including Port Augusta-Oodnadatta railway debt, £2,240,011.

In 1912 the aggregate sinking funds against total state debt amounted to £5,701,767, so that the net debt was £271,422,328, or £58 10s. 3d. *per capita*. Of the debt, 69.35 per cent. was floated in London, and 30.65 per cent. in Australia. Details of total state revenue in fiscal year 1912: Public works and services, £23,690,269 (57.39 per cent.); commonwealth subsidy, £5,858,744 (14.19); taxation, £5,419,668 (13.13); land, £3,954,192 (9.58); miscellaneous, £2,355,161 (5.71); total, £41,278,034. Details of state expenditure from consolidated revenue funds: Railways and tramways (working expenses), £13,665,906 (33.45 per cent.); public debt (interest, sinking fund, etc.), £10,869,267 (26.60); education, £3,593,620 (8.79); medical and charitable, £1,821,298 (4.46); police, £1,331,153 (3.26); justice, £866,255 (1.63); penal establishments, £206,571 (0.51); all other expenditure, £8,704,511 (21.30); total, £40,858,581.

In addition to above expenditure is state loan expenditure, which in the fiscal year 1912 amounted to £16,325,177 (of which £10,232,261 for railways and tramways). The total state loan expenditure up to June 30, 1912, was £275,508,261 (of which £168,146,283 for railways and tramways, £36,757,148 for water supply and sewerage, and £28,580,611 for harbor and river improvement, etc.).

NAVY. In 1911 the commonwealth government adopted a programme of naval construction covering a period of twenty-two years and providing for a fleet of 8 battle cruisers, 10 protected cruisers, 18 destroyers, 12 submarines, and other vessels. The vessels serving in the Royal Australian navy at the end of 1913 were: One battle cruiser (*Australia*), 4 protected cruisers, 3 destroyers, 2 torpedo boats, 2 gunboats, and 2 training ships. The *Australia*, built at Clydebank, was launched October 25, 1911, and commissioned June 21, 1913. Rear-Admiral Sir George E. Patey was appointed to her command and to that of the Australian navy. The battle cruiser proceeded to Australia, accompanied by the protected cruiser *Sydney*, which was completed at Glasgow in June. The protected cruiser *Melbourne*, which was launched at Birkenhead in May, 1912, was commissioned in January, 1913, and soon left for Australia. At the end of 1913 there were under construction for the Australian navy the protected cruiser *Brisbane* and the destroyers *Scan*, *Derwent*, and *Torrens*, all at the navy yard at Sydney, where their keels were laid in February; and two submarines at the Vickers yard, Barrow. On July 1, 1913, the responsibility for Australian naval defense, and for the maintenance of the naval establishments at

Sydney and elsewhere, was entirely assumed by the commonwealth government.

ARMY. The Australian defense act was extended in 1910 to provide universal military training up to the age of 25 years and came into force June 1, 1911, training beginning the following month. On April 1, 1910, there were 22,382 militia and volunteers, while on January 1, 1913, there were 34,271. On April 1, 1910, there were under training 10,597 senior cadets; on January 1, 1913, 89,100. By 1919 it was expected that there would be 100,000 senior cadets in training and 128,000 militia between the ages of 18 and 26 years. The citizen forces who receive pay for attendance at parades receive 16 days' training in the case of the infantry and 25 days in the case of the artillery. The senior cadets undergo 64 hours' training annually, but do not go into camp. The permanent force was increased from 1510 on April 1, 1910, to 2354 on January 1, 1913, and three permanent field batteries had been provided, as well as a re-armament of the fixed defenses being undertaken. A war railway council consisting of army, navy, and military officers of the commonwealth was formed, while a royal military college to educate candidates for commissions in the permanent force had been established with 95 Australians and 17 New Zealanders in attendance. Within three years 1500 horses for the field artillery had been purchased and all of the troops equipped with accoutrements. Manœuvre grounds had been secured at Liverpool, N. S. W., and Tamin, Western Australia.

GOVERNMENT. The executive power is vested in the British sovereign and is exercisable by his representative (and appointee), the governor-general, who is advised by a responsible ministry, the executive council. The legislative power is vested in a parliament of two houses, the Senate and the House of Representatives. The Senate has 36 members, 6 from each state. The House has 75 members, representing the states in proportion to population. Members of both houses are elected by universal adult suffrage. The governor-general in 1913 was the Rt. Hon. Thomas Baron Denman, who succeeded the Rt. Hon. William Humble, Earl of Dudley, July 31, 1911. The ministry in 1913 (formed April 29, 1910) was constituted as follows: Prime minister and treasurer, Andrew Fisher; attorney-general, William Morris Hughes; external affairs, Josiah Thomas; postmaster-general, Charles Edward Frazer; defense, George Foster Pearce; trade and customs, Frank Gwynne Tudor; home affairs, King O'Malley; vice-president of executive council, Gregor McGregor; honorary ministers, Edward Findley and Ernest Alfred Roberts. The constitution of the new ministry is given below, under **HISTORY, The Cabinet Crisis**.

The governor of each state is appointed by the crown and is assisted by a responsible ministry. Each state has a bicameral parliament elected by universal adult suffrage. Members of the upper and of the lower house respectively, are as follows: New South Wales, 57 and 90; Victoria, 34 and 65; Queensland, 43 and 72; South Australia, 18 and 40; Western Australia, 30 and 50; Tasmania, 18 and 30. Governors and prime ministers in 1913: New South Wales, Sir Gerald Strickland and J. S. T. McGowen (succeeded by W. A. Holman); Victoria, Sir John Michael Fleetwood Fuller

and W. A. Watt; Queensland, Sir William MacGregor and D. F. Denham; South Australia, Admiral Sir Day Hord Bosanquet and A. H. Peake; Western Australia, Maj.-Gen. Sir Harry Barron and T. H. Bath; Tasmania, Sir Elliston Macartney and A. E. Solomon.

HISTORY

THE OPPOSITION LEADER. Early in January Mr. Deakin resigned the leadership of the federal Opposition, alleging ill health as a reason for his retirement. He was succeeded on January 20, by Mr. Joseph Hume Cook, member for Parramatta. Mr. Cook, who had been Liberal whip during the first Deakin ministry (1905-1908) and had been recognized as one of the leading Liberal politicians of the last decade, infused fresh life into the Opposition and carried on a vigorous campaign against the government.

THE GENERAL ELECTIONS. A variety of circumstances contributed to make the elections for the commonwealth parliament, held on May 31, much more interesting than usual. In the first place, it was uncertain whether the electorate would renew the mandate of the Labor government. During its term of office the Labor party had enacted the property-tax on large estates, and had pushed with vigor a comprehensive scheme of military and naval defense; its tariff proposals (see last YEAR BOOK, p. 66), however, had been unfavorably received, its referenda had stirred up opposition, and the party did not add to its popularity by deciding to press these measures, despite their defeat in 1911. The rural districts especially were disaffected and fear of the rural workers' demands consolidated the opposition to the Labor party in the farming country of New South Wales and Victoria. The situation was clearly revealed in the vote. In the suburban and mining districts, the Laborites held their own. In the agricultural constituencies, and among the middle classes, however, the Liberals won a decisive victory. Of its 44 seats in the lower house, the Ministerial party lost 7; the control of the house therefore passed to the Liberal party which now counted among its members 38 of the 75 representatives. Matters stood differently with the Senate, however. By the constitution, only half of the 36 senators are elected at the regular triennial election; moreover, in the senatorial elections the vote is counted by states, whereas in the elections to the house the states are split up into separate constituencies. The effect of this different grouping of the vote was to give a majority in the house to the Liberals and in the senate to the Laborites. Although the Liberals and Laborite voters were almost equal in number—slightly more than 900,000 each—the labor vote was so massed in the towns of the smaller states as to overwhelm the country (Liberal) vote, and to give the Labor party 11 of the 18 senators elected.

THE REFERENDA. Additional interest was lent to the elections by the fact that the important referenda defeated in 1911 were again submitted for the approval of the electorate. The referenda (as noted in the YEAR BOOK of 1911) were the embodiment of constitutional amendments passed by the parliament in November, 1910, under the auspices of the labor

government, and submitted for ratification to a popular vote in accordance with the constitutional provision that amendments must be approved by the people as well as by the federal parliament. The amendments consisted of six fairly well-defined measures.

(1) The first would extend the power of the commonwealth over trade and commerce by removing the restriction clause "with other countries and among the states"; although commerce carried on within one state over the state railways was still exempted. (2) The second, while leaving partnerships, under state jurisdiction, would put both inter-state and intra-state corporations under federal control. (3) The third would give the commonwealth parliament power to legislate on the terms and conditions of labor in any trade, industry, occupation, or calling, on the rights and obligations of employers, and on all matters connected with industrial disputes. The object of this provision was to enable the government to extend the functions now exercised in a very small way by the Industrial Arbitration court. (4) The fourth would give the commonwealth power to pass laws for industrial conciliation and arbitration in relation to the state railways. This measure met with very strong objections at the hands of state-rights orators, who pointed out that while the commonwealth would be empowered to fix the wages of the state railway employees, the state would have to pay them. (5) The fifth would empower the commonwealth to make laws with respect to trusts, combinations, and monopolies. (6) The last would authorize the government to acquire "on just terms" any business which should be affirmed by resolution of both houses of parliament to exercise monopolistic power.

In 1911 the referenda were defeated by a powerful reaction in favor of state-rights as opposed to the increased power which would have been given the federal government and by an energetic opposition to "ruthless and reckless Socialistic" experiments. Moreover, all the proposals had to be approved, or all rejected, and many voters, disliking one measure, vetoed all. Nor did the referenda have the official sanction of the Labor Conference (party convention). Before the election of May 31, 1913, however, the referenda were adopted as the programme of the Labor party; a pamphlet was issued to explain them to the voters; an energetic campaign was waged to get a large number out to the polls; and the proposals were submitted as six separate referenda, which could be passed on individually. The result of these precautions was seen in a greatly increased affirmative vote; but the referenda were all rejected by small margins encountering the liveliest opposition in New South Wales, Victoria, and Tasmania. The vote on the six measures was as follows:

	Yes	No	Defeated by
(1)	923,249	955,699	16,225
(2)	924,153	961,041	18,445
(3)	925,230	960,401	17,586
(4)	921,736	965,037	21,651
(5)	931,858	949,013	8,578
(6)	882,414	917,480	17,534

Only 8578 votes out of almost two millions would have changed the results on (5); and the narrowness of the margin enabled the Labor

party to assume a tone of confidence for the future. In the present campaign, labor had been opposed by the press; in the next trial of strength, whenever that should be, labor would have a journal to plead its cause; and the conviction would be forced home upon the country that the present powers of the commonwealth were wholly inadequate to the establishment of peaceful, prosperous, and just industrial conditions, and that new weapons—the weapons offered by the referenda—were needed in the fight against the trusts.

THE CABINET CRISIS. As soon as the result of the elections of May 31 made it certain that the Labor party could not hope to control the House, Mr. Andrew Fisher tendered the resignations of the Labor ministry, and Mr. Joseph Hume Cook formed a Liberal cabinet on June 24, constituted as follows: premier and minister for home affairs, Mr. Cook; treasurer, Sir J. Forrest; attorney-general, Mr. W. H. Irvine; minister of defense, Senator E. D. Millen; minister for external affairs, Mr. P. M. Glynn; minister for trade and customs, Mr. L. E. Groom; postmaster-general, Mr. A. Wynne; vice-president of the executive council, Senator J. H. McColl; minister without portfolio, Mr. W. H. Kelley and Senator J. S. Clemons; Liberal leader in the Senate, Senator Millen.

The difficult position of the new ministry, which could carry the lower house only by the speaker's casting vote, and the upper house not at all, was clearly apparent in July, when the new parliament met for the first time. The Liberal majority in the lower house elected Mr. Johnson to the speaker's chair; in the Senate, the Laborites prevailed and Mr. Givens was elected president. No legislation was attempted, with the exception of a supply bill, designed to provide for finances until the government became settled. Parliament was then adjourned to August 12; just what Mr. Cook would do, no one seemed to know. Rumors were current that he intended to break the deadlock by calling new elections for the lower house. The Laborites, indeed, would have welcomed an opportunity to regain their majority in the lower house. On the other hand, both houses of parliament might be dissolved in accordance with the constitutional provision which allows dissolution after the Senate has rejected a measure passed twice by the House in an interval of not less than three months,—if both houses were to be reelected, the Liberals might hope for a complete victory. It was therefore expected that Mr. Cook would endeavor to bring about a dissolution of both houses. This expectation, by the way, was further confirmed in December, when two bills passed by the House—the civil service bill and the postal voting bill—were rejected by the Senate.

THE LIBERAL PROGRAMME. When after five weeks of adjournment, parliament reassembled on August 12, it was noticed with interest that the wig, gown, and mace—traditional emblems of the speaker's authority, discarded by the Labor government in 1910—had been restored by Mr. Johnson, the new Speaker of the House. During the adjournment of parliament, the new ministry had prepared their legislative programme and Mr. Cook was now able to lay on the table a memorandum outlining the plans of the government. As was to be expected, the

Liberal ministry simply ignored the nationalization of monopolies. (1) It did, however, propose to take up the question of industrial disputes and so amend the conciliation and arbitration law as to exempt rural workers and to prevent the courts from showing favoritism to trade unions or other organizations, any part of whose funds was directly or indirectly available for political purposes. (2) The protective tariff was to be maintained against Laborite attacks; although arrangements would be considered whereby trade reciprocity might be promoted with other dominions of the empire. (3) No less important was the promise that a comprehensive scheme was being prepared for national insurance on a contributory basis, together with super-annuation and pension provisions for the civil service and naval and military forces. In dealing with old age and invalid pensions, the government would give the greatest consideration to the liberty of the pensioners. (4) Another group of measures was in direct criticism of the Labor government's financial and civil service policies. The civil service, Mr. Cook declared, would be freed of favoritism. The contract system for public works would be restored and a general works department would be created for the purpose of supervising public expenditure. The banking system would be thoroughly overhauled and the present duplication of savings-banks throughout the country would be discontinued. It was possible also that the public debts of the individual states would be taken over by the federal treasury. Much controversy was awakened by these announcements of the Liberal government; for financial questions played a leading rôle in the elections and the Liberals have so vehemently condemned the measures of the Labor government that their own constructive programme was expectantly awaited. (5) Another section of Mr. Cook's memorandum dealt with the electoral law. The postal vote was to be restored; state and commonwealth electoral rolls were to be compared and harmonized; and the Canadian system of voting was to be introduced. The object of the Canadian ballot, it may be said, is to enable the court of disputed returns to detect illegal votes without infringing upon the secrecy of the ballot. (6) The Northern Territory and transcontinental railway lines were to be developed, and irrigation projects, such as the utilization of the waters of the Murray system, were to be prosecuted by the federal government in cooperation with the states concerned. (7) Other measures would be introduced concerning the transfer of Norfolk Island, fire and life insurance regulations, bankruptcy laws, and offenses against the commonwealth. (8) Finally, the government promised to promote with vigor the development of the navy and army.

RELATIONS WITH THE EMPIRE. Just what this last vague statement signified, it was difficult to determine; but no radical change in the policy of the Australian government was expected. Before going out of the office the Liberal ministry had formulated a clearly defined programme of military and naval preparation, and had frequently suggested that Australia, New Zealand, and Canada should hold joint conferences to arrange for the defense by the three dominions of their interests in the Pacific. Canada, Australia, and New Zealand were to cooperate in commerce as well, and by reciprocity in cus-

toms tariffs cultivate strong ties of friendship. Conferences between the ministers of trade in April and May pointed strongly in this direction; then came the Australian cabinet crisis and the question was left unsettled.

OTHER EVENTS. In March, Lord Denman laid the first stone of the new federal capital which is being built in the Yass-Canberra district of New South Wales. For further details see CITY PLANNING. On October 4, enthusiastic crowds at Port Jackson witnessed the assembling of the Australian naval unit, consisting of the flagship *Australia*, three small cruisers, and three destroyers. To these were to be added two submarines, three destroyers, and a cruiser—then under construction. Naval bases were being planned by the Australian government with the advice of English experts. The personnel of the navy was 3400 in June, 1913, as compared with 240 in 1910.

BUDGET. The general budget statement estimated that the current year's revenue of £21,462,000 plus an accumulated surplus of £2,653,000 would be entirely absorbed by the estimated expenditure. The budget, as presented on October 2, called for an expenditure of nearly £1,000,000 on naval construction, £1,500,000 on other items of naval defense, and over £3,250,000 on the army; the total defense budget being £5,750,000, an increase of £300,000 over last year.

AUSTRALIAN ANTARCTIC EXPEDITION. See POLAR EXPLORATION.

AUSTRALIAN CAPITAL AND CAPITOL. See CITY PLANNING.

AUSTRIA-HUNGARY. The Austro-Hungarian monarchy consists of the Austrian empire, the Hungarian kingdom, and the territory of Bosnia and the Herzegovina. Vienna is the capital of Austria, and Budapest of Hungary. In these cities the common legislature (the delegations) convenes alternately. The permanent residence of the sovereign is Vienna.

AREA AND POPULATION. The area of the monarchy is stated at 261,241 square miles, an area slightly smaller than that of Texas. The table below shows the area and population of Austria by crownlands, of Hungary by divisions, of Bosnia, and of the Herzegovina. The population of Austria and Hungary is shown according to the final figures for *de facto* population as returned by the censuses of December 31, 1900, and December 31, 1910. For Bosnia and the Herzegovina the population figures are those of the censuses of April 22, 1895, and October 10, 1910, and hence the totals given for the monarchy cannot be quite exact. As Bosnia and the Herzegovina were not annexed until 1908, the population figures for the monarchy in 1900 is 45,405,267.

* Census of April 22, 1895. † Census of October 10, 1910.

Austria-Hungary is conspicuous among the countries of the world for its diversity of race and language. For the monarchy (including Bosnia and the Herzegovina), the population according to the language, or the principal language, spoken was returned by the 1910 censuses as follows: German, 12,010,669; Magyar, 10,067,992; Bohemian, Moravian, Slovak, 8,410,998; Polish, 4,978,950; Ruthenian, 3,998,872; Serbian and Croatian, 5,545,531; Rumanian, 3,224,147; Slovene, 1,252,940; Italian and Ladin, 768,422; other, 1,131,693 (including foreigners in Austria and the military in Bosnia and the Herzegovina); total, 51,390,223. Population by language, with percentage of the total, in Austria and in Hungary proper (i.e. exclusive of Croatia and Slavonia was as follows, December 31, 1900:

	Austria		Hungary	
	No.	P. ct.	No.	P. ct.
German	9,950,266	35.58	1,908,357	10.40
Magyar	10,974	.04	9,944,627	54.50
Bohemian, Moravian, Slovak.	6,435,983	23.02
Slovak	1,946,357	10.70
Polish	4,967,984	17.77
Ruthenian	3,518,854	12.58	464,270	2.50
Serbian and Croatian	783,334	2.80

Italian and Ladin	768,422	2.75
Other	* 608,062	401,412	2.20
Total	28,571,984		18,264,533	

* Including foreigners, of whom about 300,000 Magyars.

The figures for Croatia and Slavonia, not included in the foregoing table, are: Croatian, 1,638,354 (62.5 per cent.); Servian, 644,955

(24.6); German, 134,078 (5.1); Magyar, 105,948 (4.1); Slovak, 21,613 (0.8); Ruthenian, 8137 (0.3); Rumanian, 846; other, 67,843 (2.6).

The population of the monarchy (including Bosnia and the Herzegovina), according to the 1910 censuses, was as follows: Roman Catholics, 33,952,368; Greek and Armenian Catholics, 5,453,019; Greek Orthodox, 4,479,357; Evangelicals (Helvetian), 2,766,568; Jews, 2,258,013; Evangelicals (Augsburg), 1,790,304; others and without confession, 790,594 (the last figure includes in Bosnia and the Herzegovina 33,758 military not classified by religion, and 612,137 Mohammedans). In Austria population by religion was: Roman Catholics, 22,530,169 (78.85 per cent.); Greek Catholics, 3,417,223 (11.96); Jews, 1,313,687 (4.60); Greek Orthodox, 666,458 (2.33); Evangelicals (Augsburg), 444,307 (1.55); Evangelicals (Helvetian), 144,379 (0.50); old Catholics, 21,288. In Hungary (exclusive of Croatia and Slavonia): Roman Catholics, 9,010,305 (49.3 per cent.); Reformed (i.e. Evangelicals of the Helvetian confession), 2,603,381 (14.3); Greek Orthodox, 2,333,979 (12.8); Greek Catholics, 2,007,916 (11.0); Evangelicals (Augsburg), 1,306,384 (7.1); Jews, 911,227 (5.0); Unitarians, 74,275 (0.4). In Croatia and Slavonia, Roman Catholics numbered 1,877,833 (71.6 per cent.); Greek Orthodox, 653,184 (24.9); Evangelicals (Augsburg), 33,759 (1.8); Jews, 21,231 (0.8); Reformed, 17,948 (0.7); Greek Catholics, 17,592 (0.7).

The *de facto* population of the larger cities and communes, as returned by the census of December 31, 1910:—in Austria: Vienna, 2,031,498; Trieste (with district), 229,510; Prague, 223,741; Lemberg, 206,113; Graz, 151,886; Brünn, 125,737; Czernowitz, 87,128; Pilsen, 80,343; Königliche-Weinberge, 77,120; Žižkow, 72,173; Pola, 70,499; Linz, 67,817; Przemyśl, 54,562; Innsbruck, 53,194; Smichow, 51,791;—in Hungary: Budapest, 880,371; Szeged, 118,328; Szabadka, 94,610; Debrecen, 92,729; Zagráb (Agram), 79,038; Pozsony (Pressburg), 78,223; Temesvár, 72,555; Kecskemét, 66,834; Nagy-Váradi (Grosswardein), 64,169; Arad, 63,166; Hódmező Vásárcsok, 62,455; Kolozsvár (Klausenburg), 60,808; Újpest (Neupest), 55,197; Miskolcz, 51,459; Pécs (Fünfkirchen), 49,822; Fiume, 49,806; Győr (Raab), 44,300; Kassa (Kaschau), 44,211; Sarajevo in Bosnia had in 1910 a population of 51,919, and Mostar in the Herzegovina, 16,392.

Birth, death, and marriage rates are decreasing in Austria-Hungary as in most of the civilized world. In Austria the (living) birth rate decreased from 37.4 in 1900 to 33.3 in 1909, the death rate from 25.5 to 22.9, the excess per thousand of births over deaths from 11.9 to 10.4, the marriage rate from 8.29 to 7.54. In Hungary (including Croatia and Slavonia) the (living) birth rate decreased from 39.4 in the period 1896-1900 to 35.6 in 1910, the death rate from 27.9 to 23.5 and the excess per thousand of births over deaths increased from 11.5 to 12.1; the marriage rate decreased from 8.8 in 1901 to 8.6 in 1910. In Austria the percentage of illegitimacy was 12.3 in 1909; in Hungary, 9.6 in 1910. Movement of the population in 1910 and 1911 (births and deaths each including stillbirths):

	Marriages	Births	Deaths
Austria, 1910.....	214,970	946,820	625,321
1911.....	216,776	919,659	647,749
Hungary, 1910.....	179,510	758,467	506,286
1911.....	193,482	747,916	526,660
Bosnia-Herz., 1910....	20,651	77,343	52,010
1911....	20,763	76,911	49,840

Reported emigration from Austria-Hungary: 1907, 386,528 (of whom 177,354 from Austria); 1908, 101,275 (56,214); 1909, 272,286 (143,532); 1910, 278,240 (148,638); 1911, 160,751 (90,134). The great majority go to the United States.

EDUCATION. Elementary instruction throughout the monarchy is free and compulsory. In Austria, reported number of elementary schools at the end of 1910 was 23,847 (including 1245 private schools), with 108,006 teachers and 4,520,138 pupils; children of school age, 4,818,870; training colleges, 142. Elementary schools in which German was the language used numbered 9120; Bohemian, 5984; other Slav languages, 7553; Italian, 737; Rumanian, 173; Magyar, 5; other languages, 4; more than one language, 274. In 1913 there were 343 gymnasias (against 316 in 1912), with 108,838 students (105,002), and 148 realschulen (149), with 49,151 students (49,065). There are many technical, professional, and special schools. In 1910 the 49 theological colleges (of which 43 Roman Catholic) had 1941 students. The eight government technical high schools were reported to have in 1913 833 teachers and 11,780 students. The government maintains eight universities, the reported number of whose teachers and students was as follows in 1913: Vienna (German), 666 and 10,225; Prague (German), 86 and 884, and (Bohemian) 249 and 4406; Graz (German), 199 and 2147; Cracow (Polish), 195 and 3647; Lemberg (Polish), 186 and 5567; Innsbruck (German), 139 and 1357; Czernowitz, 61 and 1180. Of the total university students, 30,591, the number of women was 2624, or 8.5 per cent.

In Hungary the elementary schools, grammar schools, and repetition courses comprise the "primary" schools, in which instruction is legally compulsory. In 1911 there were 19,339 primary schools, with 47,487 teachers, and 2,938,091 pupils (of whom 2,159,696 in the elementary schools), against 19,206 schools, 46,340 teachers, and 2,903,817 pupils in 1910. Children of school age in 1911, 3,545,014, against 3,112,600 in 1910. Training colleges in 1911, 96, with 1201 teachers and 10,271 pupils. Gymnasias in 1911 numbered 187, with 3882 teachers and 63,544 students; realschulen, 42, with 1020 teachers and 14,072 students. There are 49 theological colleges (of which 29 Roman Catholic), with about 330 teachers and over 2150 students. As in Austria, there are numerous special and professional schools. The government maintains five universities, at Budapest, Kolozsvár (Klausenburg), Zagráb (Agram), Pozsony (Pressburg), and Debrecen. The last two were founded in 1912; the others had, in 1911, 652 professors and 10,222 students (of whom 422 and 6858 at Budapest).

AGRICULTURE. The distribution of land in Austria and Hungary is stated as follows for 1910, in hectares (1 ha.=2.471 acres):

	Austria		Hungary	
	Ha.	P. ct.	Ha.	P. ct.
Arable land...	10,641,996	35.37	13,916,061	42.82
Garden	377,965	1.26	427,492	1.32

	Austria Ha.	P. ct.	Hungary Ha.	P. ct.
Vineyard	223,077	0.74	309,813	0.95
Meadow, pas- ture, etc. ...	7,171,779	23.90	3,977,022	12.24
Woodland ...	9,788,080	32.63	8,096,505	27.41
Lakes, marsh, etc.	105,024	0.85	66,254	0.20
Unproductive (untaxed)...	1,692,872	5.63	1,701,604	5.24
	30,000,793	100.00	32,496,437	100.00

The important products include cereals, sugar beets, wine, potatoes, and other vegetables, fruits, flax, tobacco (especially in Hungary), hops (in Bohemia), and hay. The following table shows for some of the principal crops the area (in hectares) harvested, and the yield (in metric quintals) in 1911 and 1912:

	Hectares		Quintals	
Austria:	1911	1912	1911	1912
Wheat	1,215,090	1,260,317	16,026,388	18,952,639
Rye	2,021,345	2,032,138	26,446,569	29,748,033
Barley	1,096,677	1,065,903	16,201,813	17,065,756
Oats	1,878,058	1,866,931	22,700,639	24,300,393
Corn	302,813	304,184	3,041,344	3,885,058
S. Beets	249,097	264,456	42,497,685	79,237,695
Hungary:				
Wheat	3,708,399	3,877,309	51,919,122	50,251,406
Rye	1,185,937	1,240,339	13,800,299	14,411,799
Barley	1,171,659	1,116,740	16,708,600	15,701,907
Oats	1,173,657	1,097,663	13,948,693	11,656,408
Corn	2,878,772	2,437,217	41,004,415	44,882,694
S. Beets	118,000	175,885	20,100,000	48,366,413

In 1912 36,739 hectares were sown to flax in Austria, with a yield of 233,752 quintals of fibre, and 165,235 of seed; in Hungary 10,186 hectares were sown, and the production of fibre was 96,402 quintals.

Livestock in Austria (1910), in Hungary (1911), and in Bosnia and the Herzegovina (1910): Horses, 1,802,848, 2,350,647, and 221,981; cattle, 9,160,000, 7,318,088, and 1,309,922; sheep, 2,428,101, 8,547,042, and 2,499,422; goats, 1,256,778, 426,975, and 1,393,068; swine, 6,432,080, 7,578,690, and 527,271.

MINING AND METALS. In Austria the total value of mining products (exclusive of salt, petroleum, etc.) in 1910 was 315,484,476 kronen, and in 1911 303,054,286 kronen; furnace products, 143,951,194 and 156,559,112. Quantity and value of the more important minerals produced in 1911: Coal, 14,379,817 metric tons (143,227,628 kronen); lignite, 25,265,334 tons (134,149,042 kronen); iron ore, 2,765,815 tons (24,926,390 kronen); lead ore, 23,845 tons (4,611,102 kronen); silver ore, 24,143 tons (4,097,745 kronen); mercury ore, 111,018 tons (2,655,191 kronen); zinc ore, 32,166 tons (2,474,178 kronen); graphite, 41,599 tons (1,641,082 kronen); copper ore, 10,974 tons (1,011,021 kronen). Metal production in 1911 included: Raw iron, 1,596,148 metric tons (127,345,750 kronen); zinc, 15,766 tons (9,181,278 kronen); lead, 18,097 tons (9,649,340 kronen); silver, 50,245 kilos (4,355,678 kronen); mercury, 704 tons (3,816,352 kronen); copper, 1761 tons (2,388,593 kronen); gold, 206 kilos (664,237 kronen). The coal output in 1912 is stated at 15,501,119 metric tons, and lignite, 26,487,000.

In Hungary the value of the coal output in 1910 was 16,679,000 kronen, and in 1911 15,481,000 kronen; lignite, 71,494,000 and 77,200,000; iron ore, 13,628,000 and 13,334,000; raw iron, 40,987,000 and 43,848,000; gold, 9,960,000 and 10,469,000; silver, 1,079,000, and 907,000.

COMMERCE. In both its import and its ex-

port values the total special trade of Austria-Hungary in 1912 exceeded that in any previous year. The tables below show, in thousands of kronen, the trade of the common customs territory. Imports of merchandise for home consumption, of total merchandise, of coin and bullion, and total imports:

	Mdse. Home Consump.	Total Mdse.	Coin and B.	Total Imports
1900.....	1,696,358	1,748,968	44,898	1,793,866
1902.....	1,720,335	1,770,281	166,034	1,936,315
1903.....	2,146,133	2,212,145	55,982	2,268,127
1907.....	2,501,974	2,587,147	43,839	2,630,986
1910.....	2,852,852	2,929,734	43,099	2,972,833
1911.....	3,191,711	3,275,208	41,414	3,316,623
1912.....	3,556,797	3,669,892	19,827	3,689,709

Exports of domestic merchandise, of total merchandise, of coin and bullion, and total exports, in thousands of kronen:

	Domestic Mdse.	Total Mdse.	Coin and B.	Total Exports
1900.....	1,942,003	2,061,705	66,546	2,128,251
1902.....	1,913,598	1,999,396	82,007	2,081,403
1905.....	2,243,780	2,390,722	59,533	2,450,255
1907.....	2,457,286	2,558,085	79,456	2,737,541
1910.....	2,418,606	2,587,641	80,931	2,668,572
1911.....	2,404,304	2,582,560	132,915	2,715,475
1912.....	2,733,855	2,926,665	178,420	3,105,085

The movement for three years of the more important classes of articles in the special trade (imports for consumption and exports of domestic produce) is shown below, with values in thousands of kronen. The several classes are indicated in the table as follows: *a* cotton and its manufactures; *b* wool and its manufactures; *c* cereals, pulse, flour, etc.; *d* wood and coal and other fuel; *e* vegetables, fruits, etc. (exclusive of southern fruits); *f* animal products; *g* iron and steel and their manufactures; *h* other common metals and their manufactures; *i* machines, apparatus, etc.; *j* electrical machinery and apparatus; *k* vehicles and vessels; *l* instruments watches, etc.; *m* silk and silk goods; *n* flax, hemp, jute, etc., and their manufactures; *o* colonial produce; *p* leather and its manufactures; *q* chemicals, by-products, etc.; *r* minerals; *s* tobacco; *t* rubber and its manufactures; *u* sugar; *v* cattle and draught animals; *w* apparel, etc.; *x* wood and bone manufactures; *y* glass and glassware; *z* paper and its manufactures; *aa* southern fruits; *ab* comestibles; *ac* beverages; *ad* gums and resins; *ae* turners' and carvers' materials; *af* earthenware; *ag* literary and artistic articles.

SHIPPING. Vessels entered at the ports, as reported for 1910, 192,671, of 28,652,169 tons (sail, 20,608, of 795,076 tons); cleared, 192,051, of 28,548,157 tons (sail 20,510, of 783,733 tons. Under the Austro-Hungarian flag: Entered, 178,476 vessels, of 25,353,289 tons; cleared, 177,842, of 25,264,106 tons. Merchant marine at the beginning of 1912: 522 steamers, of 554,851 tons, and 16,708 sail, of 50,700 tons.

COMMUNICATIONS. The length of railway in operation, as reported for January 1, 1913, was 48,472 kilometers (30,121 miles), of which 23,200 kilometers were in Austria, 21,881 in Hungary, and 1956 in Bosnia and the Herzegovina. Of the Austrian lines, about seven-tenths, and of the Hungarian, about four-fifths, are owned and operated by the state.

At the end of 1911, Austria had 47,076 kilo-

meters of telegraph line, with 237,847 kilometers of wire, and 7039 offices; of Austria, 40,577 kilometers of line, 157,069 kilometers of wire, and 4589 offices belonged to the state. In 1912 Hungary had 26,202 kilometers of line, 153,803 kilometers of wire, and 4765 offices. Reported for Bosnia and the Herzegovina are 3269 kilometers of line, 7526 of wire, and 180 offices. The number of Austrian post offices increased from 8592 in 1906 to 9656 in 1911; Hungary had in 1911 6480, and Bosnia and the Herzegovina 185; in addition there were 36 Austro-Hungarian post offices in foreign territory.

FINANCE. The standard of value is gold; the monetary unit is the kronen whose par value is 20.263 cents. The cost of administering the common affairs of the monarchy is borne by both governments in a proportion agreed to by their parliaments and sanctioned by the sovereign. The agreement renewed for ten years in 1907 provides that the net proceeds of the common customs be applied to the common expenditure, and the remaining expenditure be satisfied by Austria in the proportion of 63.6 per cent. and by Hungary 36.4 per cent. The expenditure of the monarchy in 1908, 514,376,180 kronen; in 1909, 642,578,124 kronen; in 1910, 573,750,039 (461,617,785 kronen ordinary, and 122,132,254 extraordinary). Net custom receipts in 1909 and 1910 were 197,979,735 kronen, and 228,451,954 kronen, respectively; net expenditure for the two years, 445,598,389 and 345,298,385. This expenditure, for 1909, was satisfied by Austria in the sum of 283,400,575 kronen, and Hungary 162,197,814 kronen; for 1910, Austria 219,609,773 kronen, and Hungary 125,688,612 kronen.

The common budget for 1913 balanced at 594,374,988 kronen. Estimated ordinary revenue, 497,950,169 kronen; extraordinary, 96,424,819. The largest estimated expenditures were for the army (425,755,569 kronen), and the navy (144,157,210 kronen). Estimated net customs receipts for 1913, 197,704,169 kronen; estimated contribution of Austria and Hungary, 386,096,953.

In Austria, revenue and expenditure have been as follows, in thousands of kronen:

	1906	1910	1911	1912
Revenue....	2,008,495	2,895,492	3,082,732	3,173,309
Exp'diture...	1,862,292	2,901,364	3,004,035	3,184,361

The budget for 1913 showed estimated revenue of 3,137,481,539 kronen (2,943,804,420 ordinary, and 193,677,119 extraordinary); estimated expenditure, 3,137,202,566 kronen (2,799,063,052 kronen ordinary, and 338,139,514 extraordinary). The larger items of estimated revenue: Railways, 887,714,940 kronen; excise, 402,600,700; direct taxes, 397,892,000 kronen; tobacco monopoly, 331,644,500 kronen; posts and telegraphs, 212,238,000. The larger estimated expenditures: Railways, 696,965,220 kronen ordinary, and 143,759,000 kronen extraordinary; finance, 874,159,910 kronen, and 8,635,057 kronen (including 509,681,469 kronen, and 641,157 for the public debt); posts and telegraphs, and the common expense of the monarchy.

In Hungary, revenue and expenditure have been as follows, in thousands of kronen:

	1906	1909	1910	1911
Revenue....	1,357,180	1,750,783	2,074,548	1,830,779
Exp'diture...	1,245,469	1,721,564	1,901,666	1,768,349

In 1911, ordinary revenue amounted to 1,702,-927,842 kronen; ordinary expenditure, 1,531,-708,160 kronen; total expenditure included 145,458,415 kronen for sinking fund. The budget for 1913 showed estimated revenue of 2,072,809,031 kronen (1,834,299,156 kronen ordinary, and 238,509,875 extraordinary); estimated expenditure, 2,072,754,196 kronen (including 1,721,781,426 ordinary, 106,928,930 transitory, and 244,043,840 for sinking fund. Larger items of estimated ordinary revenue for 1913: Railways, 481,000,000 kronen; direct taxes, 283,729,934 kronen; excise, 303,426,000 kronen; tobacco monopoly, 199,467,000 kronen; posts and telegraphs, 104,035,000 kronen.

By the terms under which the union of Austria and Hungary was effected in 1867 no debts are contracted by the monarchy. The total general debt, contracted before that time, amounted on January 1, 1913, to 5,158,396,373 kronen. On the same date the debt of Austria was 7,312,753,129 kronen. In 1911 the Hungarian debt amounted to 6,390,863,683 kronen.

ARMY. The dual monarchy maintains a common army which derives its composition from both kingdoms, though with a single organization. The second line armies, however, which are fully organized in time of peace, are distinct and are on a national basis, being known as the Landwehr in Austria and as the Honved in Hungary. In addition, certain parts of the empire maintain special recruiting service and enlist independent troops under their own regulations, as, for instance, in Bosnia-Herzegovina. The laws of July 1, 1912, tending to the reorganization and increase of the army, and reducing the period of service from three years to two, came into effect during the year 1913, due in large part to the critical condition in the Balkans. In 1913 there were 16 army corps, which included 8 cavalry divisions and 33 infantry divisions of the active army, with a Landwehr, or Honved, division attached to it. The common army, on a peace basis, was organized into 58 brigades of infantry, including 102 regiments of the line of four battalions of four companies each, 55 of which are from the Austrian territory, and 47 are known as Hungarian, four regiments of Tyrolean chasseurs, four regiments from Bosnia-Herzegovina, each regiment of which maintains a depot battalion with skeleton organization. The law of 1912 further provided that the fourth battalion of each Tyrolean regiment should transform itself into a battalion of chasseurs. The technical troops of the Austrian army were undergoing considerable reorganization in 1913. The peace strength of the army, as organized in 1913, was as follows: Common army, 339,366; Austrian Landwehr, 50,544; Hungarian Honved, 38,529; Bosnia-Herzegovina troops, 6618. On a war basis the following figures are given as provided for by the law of 1912: Common army, 1,360,000 men; the Austrian Landwehr, 240,000 men; the Honved, 220,000 men; total, 1,820,000 men. The total could be increased to well over 3,000,000 of men of all classes, trained and untrained, by utilizing all classes of Landsturm.

In 1913 the military authorities proposed to bring the annual recruit contingent up to 270,000, from which would have to be excluded breadwinners of families, etc. Bosnia-Herzegovina and the Tyrol would provide an addi-

tional quota of 9000 recruits. While the army bill of 1912 provided that the army and navy would take 159,000 of the annual contingent, the Austrian Landwehr 28,000, and the Hungarian Honved 25,000; the new scheme would increase these numbers to 182,000, 36,000, and 34,000. The peace establishment thus would be raised from 463,000 to 560,000 men and the strength of the various units would be increased. New machine gun detachments were to be formed and for these and for new guns of all types for the artillery there was set aside the sum of 1,000,000,000 kronen, of which 800,000,000 were non-recurring items which were to be spread over five years. The army budget was to be 560,000,000 kronen as against 460,000,000 kronen. It was proposed to reorganize the artillery on a very extensive scale and to increase the number of field artillery batteries by 42, for which material was available. It was estimated that the actual increase in guns would be from 1900 to 3000, bringing the strength nearer to that of the other continental powers.

NAVY. Number and displacement of warships of 1500 or more tons, and of torpedo craft of 50 or more tons, built and building, December 1, 1913: Dreadnoughts (battleships having a main battery of all big guns, that is, 11 or more inches in calibre): built 2, of 40,020 tons; building, 2, of 40,020 tons. Predreadnoughts (battleships of about 10,000 or more tons whose main batteries are of more than one calibre): built, 6, of 74,613 tons; building, none. Coast-defense vessels (including smaller battleships and monitors): built, 6, of 41,700 tons; building, none. Battle cruisers: none built or building. Armored cruisers: built, 2, of 13,380 tons; building, none. Cruisers (unarmored warships of 1500 or more tons): built, 5, of 13,815 tons; building, 2, of 6966 tons. Torpedo-boat destroyers: built, 15, of 7089 tons; building, 3, of 2361 tons. Torpedo boats: built, 36, of 6048 tons; building, 27, of 6642 tons. Submarines: built, 6, of 1686 tons; building, 8, of 4400 tons. Total tonnage: built, 198,351; building, 60,389. Austria-Hungary is eighth among the nations in amount of warship tonnage completed, and also in the aggregate of tonnage built and building. Excluded from the vessels listed above: Ships over twenty years old from date of launch unless reconstructed and rearmed within five years; torpedo craft over fifteen years old; transports, colliers, repair ships, torpedo depot ships, and other auxiliaries; vessels not actually begun or ordered, although authorized.

Officers and men in 1913, 20,574, including one admiral of the fleet, three admirals, ten vice-admirals, 67 rear-admirals, 614 captains and commanders, and 180 other line officers.

Of the new dreadnoughts, two have been commissioned, the *Viribus Unitis* in October, 1912, and the *Kaiser Franz Joseph* in July, 1913. Montecuccoli retired as marine commandant in February, 1913, Admiral Rudolf (Count) and commander-in-chief, and was succeeded by Admiral Anton Haus.

GOVERNMENT. Under the constitutional compromise of 1867, the administration of the monarchy as a whole is directed by the emperor-king, acting through three ministries (for foreign affairs, finance, and war), who are re-

sponsible to the delegations. These bodies, consisting of sixty members each, are elected by the Austrian and Hungarian parliaments respectively and annually convene alternately at Vienna and Budapest. They deliberate separately, communicating only in writing; but if they reach no agreement after three interchanges, they meet as one body and vote without debate. Their duties are to examine the requirements of the common services of the monarchy and to advise the parliaments as to necessary appropriations. The common government deals with finance relating to the monarchy as a whole, foreign affairs, the diplomatic, postal, and telegraphic services, the army, the navy, and certain state monopolies. The administration of Bosnia and the Herzegovina is carried on under the (common) minister of finance. Austria and Hungary have each a representative parliament and a responsible ministry appointed by the sovereign. Croatia and Slavonia and each of the Austrian crownlands have separate diets. The sovereign in 1913 was Franz Joseph I. He was born August 18, 1830, and became emperor of Austria December 2, 1848, and king of Hungary June 8, 1867. The heir presumptive is his nephew, the Archduke Franz Ferdinand, born December 18, 1863.

Common ministry in 1913: Premier and minister for foreign affairs, Leopold (Count) Berchtold, Baron von und zu Ungarschütz (appointed February, 1912); finance, Dr. Leon (Ritter) von Biliński (appointed February, 1912); war, Gen. A. (Ritter) von Krobatin (appointed December, 1912). The navy department is a section of the war ministry; the commandant, Admiral Rudolf (Count) Montecucoli, retired in February, 1913, and was succeeded by Admiral Anton Haus.

The Austrian ministry in 1913 (formed November 3, 1911): Premier, Karl (Count) Stürgkh; minister of the interior, Dr. Karl (Baron) Heinold von Udynski; worship and public instruction, Dr. Max (Ritter) von Hussarek von Heinlein; finance, Wenzel (Count) von Zaleski; commerce, Dr. Rudolf Schuster von Bonnot; railways, Zdenko (Baron) von Forster; agriculture, Franz Zenker; national defense, Gen. Friedrich (Baron) von Georgi; public works, Ottokar Trnka; justice, Dr. Viktor (Ritter) von Hochenburger; without portfolio, Dr. Ladislav (Ritter) von Dlugosz.

The Hungarian ministry: Premier, Stephan (Count) Tisza; minister of the interior, János Sándor de Csikszentmihály; finance, János Telezky; commerce, János (Baron) Harkányi; agriculture, E. (Baron) Ghyllányi de Loz és Bernyeze; public instruction and worship, Ad. Jankovich de Jeszanicze; justice, E. de Balogh; national defense, Lieutenant-Field-Marshal S. (Baron) Hazay; for Croatia and Slavonia, Dr. Th. (Count) Pejácsevich de Borosjenő és Szeged; minister *a latere*, Stephan (Baron) Burián de Rajecz.

HISTORY

FOREIGN AFFAIRS. The defeat and spoliation of Turkey-in-Europe, and the subsequent quarrels of the victorious Balkan allies were of vital concern to the Dual Monarchy: Austro-Hungarian dreams of influence if not of expansion in the Balkan peninsula were violently

disarranged. Russia was posing as the "big brother" of the Slavs and was thwarting Austria-Hungary at every turn; the Balkan states might be so strengthened and united as to defy Austro-Hungarian penetration; Italy might at any moment prove to be an embarrassing rival in Albania; and Germany might not always be willing to support Austro-Hungarian demands. Even more serious were the internal problems connected with the Balkan situation. Loosely constructed of various and incompatible nationalities, and with difficulty retaining the already discontented Slavs within the empire, the Austro-Hungarian state might be seriously menaced by any outburst of Pan-slavic sentiment or by the establishment of strong and stable Slavic states to the southwest. While the ever-troublesome race-question was constantly aggravated by the opposition of Austro-Hungarian diplomacy and Slavic liberation, the financial resources of the empire were being sadly over-burdened by the expense of mobilizing and maintaining reserves ready for instant intervention in the Balkan conflict or even for a possible clash with Russia. Three hundred and fifty millions of crowns were demanded by these "military precautions," even though the Austrian budget showed a deficit of \$30,000,000 for six months. In addition the joint ministry thought it necessary to demand an increase of 35,000 recruits in the annual contingent of the army.

The rôle played by Austro-Hungarian diplomacy in the Balkan wars has been noted in another connection (see **TURKEY AND THE BALKAN PEOPLES**); yet several incidents deserve special mention as peculiarly concerning Austria-Hungary. The decision of the powers to incorporate Scutari in an autonomous Albania was taken, it will be remembered, at the instance of Austria-Hungary and Italy; and it was Austro-Hungarian influence that procured the escape of civilians from the beleaguered city of Scutari. It was because of Austro-Hungarian pressure that Montenegro was forced to relinquish Scutari, after the powers had received word from Vienna that failing concerted intervention there would be Austro-Hungarian intervention. The excitement on this occasion was heightened, it may be noted in passing, by reports in the *Neue Freie Presse* to the effect that the Austro-Hungarian military *attaché* at Cetinje had been stoned. Upon the unwilling submission of Montenegro followed a relaxation of the tension in Vienna and the mobilization of troops on the frontier no longer gave birth to predictions of war. The war waged by Greece and Serbia against Bulgaria was preceded by an attempt at mediation by Count Berchtold, and was probably shortened by the warning delivered to Greece and Serbia on July 25, that Austria-Hungary would not tolerate the complete humiliation of Bulgaria; for in Vienna there was no desire to see Bulgaria robbed for the benefit of Serbia. The gains guaranteed to Serbia by the treaty of Bucharest seemed entirely too great; but the demand for revision of the treaty found no echo in Berlin. By manifesting his approval of the treaty, Emperor William created some annoyance in Austro-Hungarian circles; but he subsequently atoned for his seeming want of tact by renewed protestations of loyalty and friendship as "the faithful ally of Austria-Hungary," and the celebrations in October of the centenary of the

"Battle of the Nations" and on December 2, of Francis Joseph's sixty-fifth year on the Austrian throne afforded occasions for noteworthy expressions of mutual regard.

TREASON IN THE ARMY. Sensational revelations followed the suicide of Colonel Redle, one of the chiefs of the Austrian military secret service department, employed on frontier work, who shot himself on May 28. He was forced to take his own life, it was hinted, by brother officers who knew of his treasonable intercourse with Russian officials. Investigation disclosed what was alarmingly styled "a widespread system of treachery." The conduct of a number of officers was examined, and one of them, Lieutenant Jandrie, was sentenced to life imprisonment.

THE "EMIGRATION SCANDAL." In Austria a considerable scandal was started by the closing of the Canadian Pacific Railway Company's Vienna offices in October. The Canadian Pacific, as well as other transportation companies, had connived, so the story went, at the evasion of military service by many adult males, especially in Galicia, who emigrated to Canada without serving their term. In this manner Austria had lost thousands of potential soldiers. Widespread comment was evoked by the detention of Canadian Pacific officials. The governor of Galicia ordered the police to arrest all men of military age who attempted to leave the country. The whole matter was subjected to thorough investigation by the budget commission of the Reichsrath. The foremost opponent of the government in this matter seemed to be a Polish editor, Stabinski, who had urged his fellow-countrymen to forsake Galicia, where they could hope for nothing but misery, and settle in Canada, the land of promise.

SUSPENSION OF BOHEMIAN DIET. The bickerings between the Czechs and the Germans in the Austrian state of Bohemia reached a crucial point in the spring of 1913 in spite of the fact that in 1912 an amicable settlement of the language and education questions had seemed imminent. The Balkan War, with its burdensome precautionary demands on Austria-Hungary, gave occasion for an intensification of race jealousies; and the Czechs took every opportunity to show that they were quite out of sympathy with the Austro-Hungarian policy toward the Slavs of the Balkan peninsula. On April 24, when the news of the fall of Scutari was received at Prague, there was an outburst of indignation on the part of the Germans against the Slavs, and a mob which gathered around the Czech National-Socialist headquarters was dispersed only after a clash with the police. Meanwhile the Bohemian Provincial Diet had been so hopelessly entangled in quarrels between the Czechs and the Germans that it had neglected to pass essential finance laws; the school-teachers were clamoring for pay; and the treasury was almost empty. In this situation, Prince Lobkowitz, as president of the Diet, complained to the emperor, and desired that the Diet should be compelled to pass the necessary financial measures. Francis Joseph was unwilling to support Prince Lobkowitz, however. The prince then resigned, and by imperial letters patent, issued July 26, the Bohemian Diet was dissolved and the autonomy of Bohemia was suspended.

The government of the province was taken over by a crown commission of administration.

The Germans were angered by the fact that five of the eight commissioners were Czechs; the Czechs, on the other hand, bitterly resented the infringement of their constitution and the suspension of the autonomy of their province, which, they said, merely meant that Count Thun, the governor, would become dictator of the province. Nor were the first measures of the new régime signally happy. In order to extricate the government from its embarrassing financial situation the commission augmented the direct taxes by ten per cent. and levied a tax on beer. It was hoped by this means to obtain an additional revenue of 17,500,000 crowns; it was certain that increased taxes would mean increased unpopularity for the administration.

THE HUNGARIAN FRANCHISE REFORM. The restricted franchise in Hungary, that is, in the elections for the Hungarian Lower House (*Képviselőház*), has long been an instrument for a twofold oppression—of the other races by the Magyars and of the lower classes by the aristocracy and bourgeoisie. Franchise reform has therefore been the object of unceasing endeavor on the part of the discontented elements, but the would-be reformers, disagreeing among themselves, have been unable to enforce their demands. In 1912, however, the Lukács ministry promised that the much-desired reform was about to be accomplished; and on January 2, Premier Ladislaus von Lukács made public announcement of a new franchise reform bill. It was a sorry fulfillment of the democratic hopes; to be sure, it doubled the electorate, but the franchise as amended would be neither general, secret, nor equal. The effect of the enlarged electorate was practically counteracted by a complicated system of age-differentiation. Common laborers must be thirty years old before they might vote. On the other hand, members of the wealthier class, who could afford to go through an intermediate school would be allowed to vote at 24. Others, who had some education, but had not received an intermediate diploma, might vote at 24 if they happened to own 8 yoke of oxen, or had paid a direct tax of 20 crowns, or had worked in certain kinds of positions for a fixed term of years. This skillful manipulation of age, property, and educational qualifications so as to retain the leadership of the classes already in power naturally evoked the wildest and bitterest protests. Even within the government party there seemed to be some dissatisfaction, and when the minister of justice, M. Székely, resigned because of the undemocratic character of the "reform," rumor anticipated a serious split. M. Lukács was firm, however; he replaced M. Székely with M. Balogh; and urged the government party to give the franchise bill its undivided support. As the success of the bill became more probable the Social Democrats, the *Nepszava*, increased the violence of their attacks on the measure and even threatened to call a general strike on January 26. Again in February the general strike was threatened, but M. Lukács replied through the *Pester Lloyd* that the government could not be intimidated by recourse to such means; and no general strike took place. Meanwhile the opposition members of the lower house were doing their utmost to discredit the cabinet, and refused to have anything to do with the franchise reform bill. Despairing of compromise or conciliation, the government party pushed its measure; it was accepted by a special committee of

40 on February 13, passed by the lower house, and approved without amendment by the house of magnates on March 15.

On March 13, the hundred opposition members, who had hitherto absented themselves from the sessions of the Hungarian lower house, appeared in the chamber and created such a disturbance that it was necessary to call in the police to eject the disorderly deputies. Thereupon the majority proceeded to increase the severity of the house rules. The session was closed by royal order on March 15. Deputies Lovaszy and Rath were to be excluded from 15 sessions on account of disorderly conduct, and 12 of the opposition were forbidden to enter the hall, under penalty of 500 crowns. The next session was called for May 5.

THE HUNGARIAN CABINET CRISIS. During the interval between sessions, government and opposition vied in bandying charges of corruption. Especial attention was attracted by M. Zoltan Desy, who had contemptuously styled Dr. Lukács "the greatest Panamist in Europe" ("Panamist"—grafter, referring to the scandals of the French canal project, which made "Panama" a by-word for corruption). On February 17, M. Desy was sentenced to a fine of 400 crowns and a month in prison for libel. He carried his case to a higher court. The opposition made M. Desy their idol; they feted him as the arch-enemy of corruption; and Counts Julius Andrássy, Albert Apponyi, and Aladar Zichy came to his support with a joint declaration that M. Lukács had wrongfully diverted over 4,000,000 crowns into the electioneering funds of the ministerial party. The premier did not seem to be able to offer convincing proofs of his innocence; instead, he preferred charges of corruption against his accusers. The war of re-priminations was brought to a climax in June by the conclusion of the Desy libel case. The judicial decision handed down on June 14 lamented M. Desy's outspokenness, but found that his accusations were justified. It was held that upon the conclusion of contracts with the Bank of Hungary, M. Lukács had wrongfully accepted large sums, which he had used to defray the election expenses of his party.

The exultant opposition now appeared in full force in the house of representatives to demand the resignation of the ministry. Count Tisza was greeted with jeers and cat-calls when he called the house to order; and unable to control the increasing disorder and excitement, he called upon the new parliamentary guard—just established for the purpose of quelling disturbances in the legislature. In the ensuing uproar ex-Premier Count Khuen-Hedervary was knocked down by the sword of the captain of the guard. It was hardly possible for Dr. Lukács to maintain his position after the disclosure of the corrupt practices. He therefore resigned on June 4. No change of parties took place, however, inasmuch as the majority had not changed.

THE NEW CABINET. Count Stephen Tisza was finally selected as the successor of Dr. Lukács, and on June 9 he formed a cabinet constituted as follows: Minister of the interior, M. Johann Sándor; minister of agriculture, Baron Emerich Ghillanyi; minister of the royal court, Baron Stephan Burian von Rajecz; minister of justice, Dr. Franz Szekely; minister of finance, Johann Teleszky. Dr. Szekely, it will be remembered, was the minister who resigned as a protest against the franchise reform bill; his incorpora-

tion in the new cabinet, however, was hardly to be taken as significant of a more democratic tendency. Count Tisza was too well known as the tyrannical president of the chamber to be looked to for liberal concessions. His ability and energy made him even more undesirable as a premier—that is from the viewpoint of the opposition. An attempt to overthrow him was made by Marquis George Ballavicini, who alleged that Count Tisza had endeavored to influence the witnesses in the recent libel cases. The prime minister found an easy way to answer the accusation. He challenged the accuser to a duel and sustained his honor at the expense of a slight wound, this being his third political duel of the year.

THE NEW HUNGARIAN OPPOSITION. In September, Count Julius Andrássy succeeded in forming a new constitutional opposition. In the new group a few independents and a number of the least violent of the nationalists were united on a platform of franchise extension, vote by ballot, reformed parliamentary procedure, reconciliation of Hungarian unity with the rights of non-Magyar races, a separate customs-tariff, and a separate state bank for Hungary. The present government was to be opposed by parliamentary methods. For a time all went well; the opposition benches in the house were again filled; and the European press commented favorably on the restoration of parliamentary government in Hungary. In November, however, disorders again broke out in the house, the parliamentary guards were called in, and the opposition withdrew.

CROATIA. The suspension of constitutional liberties by the *Ban* of Croatia-Slavonia, M. Edward Cuvaj, had provoked such widespread indignation in 1912, that the Hungarian government found it expedient to recall M. Cuvaj from the troublesome provinces and to entrust the performance of his duties to Baron Skerlecz, as royal commissioner. An anarchist attempt on his life, in August, 1913, might well have exasperated Baron Skerlecz and induced him to continue the inclement policy of his predecessor; he persisted notwithstanding in an endeavor to conciliate the provinces. In December, simultaneously with the report of his official appointment as *Ban*, came reports that the censorship of the press had been relaxed and the right of public meeting restored. A compromise was effected in regard to the state railways: the Croatians obtained assurance that railway officials who come into contact with passengers or with workmen would use the Croatian language, while the Hungarian government was satisfied with the understanding that Magyar would be spoken in the offices of the railways. The improvement in the relations between the government and the people made it possible to restore the Croatian Diet. Elections for the Diet were held on December 15 and resulted in a majority for the party loyal to the Hungarian-Croatian compromise of 1868.

AUTHORS' CLUB. A social club of men of letters, organized in New York City in 1882, to which only those who are the authors of a published book proper to literature are eligible. Almost all distinguished American authors have been, or are, members of it, and it draws the bulk of its membership from the active literary workers of New York and the vicinity. The library of the club is notably rich in literary biographies, and includes a valuable collection

of rare books and first editions; of letters and autographs; and of precious souvenirs of many kinds connected with American and English authors.

AUTOMOBILE FIRE APPARATUS. See FIRE PROTECTION.

AUTOMOBILES. The increasing use of automobiles both for pleasure and business, is shown by the increased registration in 1913. Up to the beginning of the year there were registered in all the States 1,115,376 cars. On October 31, 1913, the registration was 1,254,971. There were new registrations of 146,365 in the first nine months of the year. The States having the largest registration in 1913 were: New York, 129,441; California, 118,135; Illinois, 90,522; Ohio, 80,452; Pennsylvania, 78,437; Iowa, 68,120; Massachusetts, 59,954; and Indiana, 45,000. Of the total cars registered, 1,125,257 were gasoline cars for passengers; 71,981 were gasoline commercial cars; 34,075 were electric passenger cars; 17,687 were electric commercial cars. It is estimated by the *Automobile* that the total number of cars and trucks produced in 1913 was approximately 450,000. Of these, 410,000 were gasoline passenger cars and 30,000 motor trucks. The production for 1912 was 378,261 motor vehicles. The most interesting feature of the industry continues to be the increased selling of low-priced cars. The average price for cars in 1912 was slightly below \$1000, and it is pretty certain that this average was lowered in 1913.

In many States new laws relating to automobiles were passed in 1913. The legislature of Colorado passed the first law requiring an annual State licensing of automobiles. Idaho, Indiana, and Wyoming passed new laws. In Ohio, the Warnes law was declared unconstitutional. A general dissatisfaction is expressed in most of the States with the present legislation governing automobiles, and in the latter part of the year there was a considerable amount of agitation for Federal regulation.

There were few changes of construction of automobiles in 1913. A standard has apparently been reached which will be altered only in minor details. The importation of foreign cars continued to decrease during the year, and the export of American cars to foreign countries increased, as it has in the last few years.

RACING EVENTS. Earl Cooper of the United States and G. Boillot of France won the highest laurels as drivers in 1913. Cooper in a Stutz car made a new world's record of 3 hours, 27 minutes, 23.80 seconds for 200 miles on a circular track at Fresno, Cal., February 10. This driver also won a 250-mile road race at Tacoma, Wash., on July 7 (3 hours, 32 minutes, 8½ seconds), a 437-mile road race at Santa Monica, Cal., on August 9 (6 hours, 1 minute, 52 seconds), a 252-mile speedway race at Corona, Cal., on September 9 (3 hours, 21 minutes, 29½ seconds), and a 301.81-mile free-for-all race also at Corona (4 hours, 2 minutes, 38 seconds). Cooper started in six races in all, finishing first five times and second once. Boillot distinguished himself by winning the 750-mile Grand Prix at Picardy, France, July 12, in 7 hours, 53 minutes, 56½ seconds. He also won a 335-mile road race at Le Mans, France, August 5, in 4 hours, 21 minutes, 56 seconds, and the coup l'auto 286-mile race at Boulogne,

France, September 21, in 6 hours, 7 minutes, 40½ seconds. The road contests for the Grand Prize and the Vanderbilt Cup, which were scheduled for Savannah, Ga., were given up, as the promoters were unable to secure a sufficient number of entries. California was the scene of most of the road races in the United States.

The best showing of American drivers aside from Cooper was made by G. Anderson, Ralph de Palma, and B. Oldfield. Anderson in a Stutz won the Elgin National Trophy race, August 30, his time being 4 hours, 13 minutes, 38 seconds. De Palma captured the 302-mile road race for the Cobe Trophy in a Mercer, covering the distance in 4 hours, 31 minutes, 56 seconds, an average speed of 66.8 miles per hour. Oldfield established a new record of 46.40 seconds for the mile on a circular track at Bakersfield, Cal. Other important races in the United States during the year were: 500-mile motordome at Indianapolis, May 30, won by Jules Goux of France in a Peugeot, S. Wishart in a Mercer second, and C. Mertz in a Stutz third (6 hours, 31 minutes, 43 seconds); 300-mile beach race, Galveston, Texas, July 30, won by L. Disbrow in a Simplex (4 hours, 17 minutes, 3.40 seconds); Los Angeles, Phoenix, and San Diego 574-mile road race, November 4, won by O. Davis (18 hours, 47 minutes); 517-mile road race, won by J. Newkirk (17 hours, 10 minutes); 444-mile road race from Sacramento to Los Angeles, July 4, won by F. Verbeck (11 hours, 1 minute); 200-mile track race at Columbus, Ohio, July 4, won by R. Mulford. The Stutz car made the best racing record of the year, winning seven out of sixteen starts, finishing second three times and third once. The Buick was represented in twenty events, winning two firsts, two seconds, and three thirds; and the Fiat in eleven events, winning two firsts, two seconds, and one third. The Mercer in five starts captured one first, two seconds, and two thirds.

AUTOSEROTHERAPY. This variety of serum therapeutics found increasing favor during 1913. The method consists of withdrawing and reinjecting immediately serum or serous exudates from the patient's own body. Its greatest usefulness is in the treatment of conditions attended with collections of fluid in the chest and abdominal cavities. The simplicity of technique commends it in these conditions as well as its efficiency, according to clinicians who have had experience with the method. A paracentesis needle attached to a graduated glass syringe is thrust into the cavity containing an exudate, enough serum is aspirated to show its character (whether purulent or serous), the needle is withdrawn nearly to the surface and a few cubic centimeters of the fluid injected into the subcutaneous tissues. The skin is sterilized with tincture of iodine and the syringe sterilized by boiling. As a rule favorable results appear promptly with the rapid absorption of the pathologic fluid, without further tapping. A variation of this technique is to raise a blister, withdraw the serum so produced, and inject it into the subcutaneous tissues. Not only pleurisy and abdominal dropsy are thus treated, but effusions such as hydrocele or those caused by mechanical injury, respond equally well.

Spithoff used autoserotherapy in a large number of cases with chronic skin disease, and

JOHN LUBBOCK, FIRST BARON AVEBURY

Died May 28, 1913

found that pruritus, psoriasis, and other chronic affections were favorably influenced in so far as the reaction thereby induced seemed to supply the impetus needed to start the disease on the road to a cure. Spiethoff obtained his serum from a vein and reinjected it into a vein. Lewin employed autoserotherapy in two cases of cancer, one of which had abdominal ascites. He injected 10 c.c. of the ascitic fluid after tapping. In the other case an autolysate of cancer cells was injected.

AVEBURY, JOHN LUBBOCK, First Baron. An English scientist and writer, died May 27, 1913. He was born in London on April 30, 1834, and was the eldest son of Sir John William Lubbock. A considerable part of his education was received at home, but he went to Eton, and thence directly into his father's bank. He early began to distinguish himself in various fields, and displayed a remarkable talent for business, politics, science, and letters. In 1865, when he was 31 years of age, he succeeded to the baronetcy on the death of his father. In 1870 he entered on his long parliamentary career, devoting himself to the work of Parliament with assiduity. He interested himself in social and educational movements, and in addition found time to keep up his entomological and other scientific studies. In 1872 he was appointed vice-chancellor of London University, and this position he held until 1880, having become a member of Parliament for the university at the general election in that year. He continued to sit in Parliament for London University for twenty years. He was unable to follow Mr. Gladstone in the events of 1885-86, which broke up the Liberal party, and he joined the Liberal Unionist group. Among the important measures for which his efforts were largely responsible were the formation of the early closing association and the passage through Parliament of the shop hours regulation bill. This bill limited the hours of young persons under eighteen. In 1889 he introduced a bill for the compulsory closing of shops throughout the United Kingdom at eight o'clock on the first three nights of the week. This was defeated by a large majority. In 1899 he was able to carry through Parliament a bill providing for seats for employees in shops. In 1904, largely through his efforts, the shop hours act was passed. This empowered local authorities to make closing orders on the representation of a two-thirds majority of traders. In 1900 his work in Parliament came to an end as the result of his being raised to the peerage. In addition to his parliamentary duties and his interests in scientific pursuits, he remained at the head of the great banking firm of Robarts, Lubbock & Co. He also devoted much attention to municipal work. In 1889-90 he was vice-chairman of the London County Council and was chairman of that body in 1890-92. The range of his interests and his faculty of presenting scientific facts in an interesting manner won for him a higher place in the estimation of his fellow-citizens than was attained by many men of greater powers of mind. In industry and capacity for giving attention to a variety of interests simultaneously he has not often been equaled. He was an anthropologist, an ethnologist, and a botanist. He was also a great student of geology, and notable as a man of letters. His published works which had the largest circulation were those which dealt

with literature and the art of living. These were immensely popular. Among them may be noted the *Hundred Best Books*; *Pleasures of Life* (Parts I. and II.); *The Use of Life*, and *The Beauties of Nature*. Over 170,000 copies of *The Use of Life* were sold, and of *The Pleasures of Life*—the two parts together—nearly 500,000 copies were sold. In among other works, and in addition to the books already mentioned, he published *Flowers, Fruits and Leaves*; *Origin and Metamorphoses of Insects* (1874); *Ants, Bees and Wasps* (1882); *On the Senses, Instincts and Intelligence of Animals*; *Chapters on Popular Natural History*; *Prehistoric Times* (1869); *The Origin of Civilisation and the Primitive Condition of Man*; *The Scenery of Switzerland*; *The Scenery of England* (1902); *Coins and Currency* (1902); *Essays and Addresses* (1903); *Free Trade* (1904); *Marriage, Totemism, and Religion* (1911); and over 100 scientific memoirs in transactions of the Royal Society.

AVIATION. See **AERONAUTICS**, **MILITARY PROGRESS**, **NAVAL PROGRESS**, and **Army and Navy** under various countries.

BACON, JOHN MOSBY. An American soldier, died March 20, 1913. He was born in Kentucky in 1844. In 1862 he enlisted as second lieutenant in the Eleventh Kentucky Cavalry, but a few months later joined the Fourth Kentucky Cavalry. He fought throughout the Civil War, rising to the rank of major, and was honorably mustered out of service in 1865. In the following year he was appointed captain in the Ninth Cavalry. He studied at the Artillery School, graduating in 1872. In 1884 he was appointed major in the Seventh Cavalry; in 1897, colonel in the Eighth Cavalry. At the beginning of the Spanish-American War he was made a brigadier-general of volunteers. He received the brevet rank of major in 1867 for volunteering at the siege of Resaca, Ga. He saw service against the Indians on the Rio Pesos in 1867, and served in other Indian campaigns. From 1871-84 he was aid to General Sherman. In 1899 he was honorably discharged from the volunteer service. In the same year he was retired at his own request after thirty years' service.

BAHAMAS. A British West Indian colony, made up of about twenty inhabited islands and numerous islets and rocks, whose area totals 4403½ sq. miles with a population of 55,944. The principal islands are New Providence (with 13,554 inhabitants and containing the capital, Nassau), Abaco, Harbour Island, Eleuthera, Inagua, Cat Island, Ragged Island, Rum Cay, Exuma, Long Island, Long Cay, etc. The colony is a popular winter resort for North American tourists, and its trade relations are mainly with the United States. Free primary education is provided by the government schools. The soil is especially suitable for sugar-cane and cotton, but these industries have declined. Over 20,000 acres are devoted to the sisal plant (export in 1911, 6,672,780 lbs., valued at \$44,855). Imports and exports for the calendar year 1911 were valued at \$311,095 and \$209,251 respectively, compared with £239,014 and £188,286 in 1910. Revenue and expenditure (1911-12), \$85,592 and \$82,676 (\$84,386 and \$85,315 in 1910-11.) The customs revenue in 1911-12, \$71,563. Tonnage entered, 1,739,957 (149,415 British). Total public debt March 31,

1912, £51,568. G. B. Haddon-Smith was governor in 1913.

BAKER, JAMES HEATON. An American soldier, editor, and writer, died May 26, 1913. He was born in Monroe, Ohio, in 1829, and graduated from Ohio Wesleyan University in 1852. In 1855 he was elected secretary of State of Ohio, serving two years. In 1857, having moved to Minnesota, he was elected secretary of State of that State, and was re-elected in 1861. He resigned the office to enter the army. In 1862-63 he served under General Sibley in the Indian War and was placed in command of the post at St. Louis under General Schofield. In 1865 he was breveted brigadier-general of volunteers for faithful and meritorious services. In the same year he was mustered out of service. From 1871-75 he was United States commissioner of pensions under President Grant; from 1875-79, surveyor-general of Minnesota; from 1881-86, State railroad commissioner. In 1879 he purchased the *Union and Record*, Republican newspapers, and combined the two, forming the *Mankato Free Press*, which he edited and published for several years. Of the history of Minnesota and the region of the Great Lakes he wrote extensively. His chief work, published in 1908, was *The Lives of the Governors of Minnesota*.

BALL, SIR ROBERT STAWELL. A British astronomer, died November 25, 1913. He was born in Dublin in 1840, and was educated at Trinity College, Dublin, from which he graduated as university student in mathematics in 1861. In 1865 he was appointed astronomer to the Earl of Rosse, and spent two years in charge of the latter's observatory. Two years later he received the appointment of professor of applied mathematics and mechanism at the Royal College of Science for Ireland, and then professor of mathematics at Trinity College, a chair which he occupied for seven years. In 1873 he became a fellow of the Royal Society, and in the following year was made professor of astronomy in Trinity College, Dublin, and royal astronomer of Ireland. He held the latter post until 1892, when he was appointed Lowndean professor of astronomy and geometry at Cambridge University, together with the position of director of the Cambridge Observatory. In 1901 and 1902 and again in 1907 he visited the United States, where he delivered a series of lectures. On his second visit he spoke in behalf of the peace movement. He also complimented American scientists and said that the greatest astronomical discoveries were being made by American astronomers at the Harvard, Yerkes, and Lick observatories. In 1886 he was knighted by Queen Victoria, and he received the degree of LL.D. from Trinity College. At various times he was president of the Royal Astronomical Society, of the Mathematical Association,

and of the Royal Zoölogical Society of Ireland. His published writings include *A Treatise of Spherical Astronomy*; *The Story of the Heavens*, (1885); *Star Land* (1889); *In Star Realms*; *In the High Heavens*; *Time and Tide* (1889); *The Cause of the Ice Age*; *Atlas of Astronomy* (1892); *The Story of the Sun* (1893); *Great Astronomers* (1895); *The Earth's Beginning*; and *Popular Guide to the Heavens* (1905). He also wrote many memoirs on mathematical, astronomical, and physical subjects.

BANKS AND BANKING. Matter of interest in connection with the study of banking conditions will be found under the following articles: NATIONAL BANKS, STATE BANKS, SAVINGS BANKS, POSTAL SAVINGS BANKS, LOAN AND TRUST COMPANIES, AGRICULTURAL CREDIT, CURRENCY REFORM, CLEARING HOUSE AND FINANCIAL REVIEW.

GENERAL STATISTICS. There were in the United States on June 4, according to the report of the Comptroller of the Currency, 7473 national banks; 14,011 State banks; 1978 savings banks; 1016 reporting private banks; 1515 loan and trust companies. The aggregate resources of these 25,993 banks were \$25,712,163,000. This was an increase over 1909 of 22 per cent. The total loans and discounts were \$14,626,700,000; bonds, stocks, and other securities held amounted to \$5,407,200,000; specie on hand totaled \$1,113,300,000. In 1903 there were only 13,684 banks with aggregate resources of only \$7,738,900,000. The individual deposits increased from \$9,553,600,000 in 1903 to \$12,784,500,000 in 1908, and to \$17,475,700,000 in 1913. Of these deposits one-third were held by national banks and two-thirds by all others. Of the loans and discounts 42 per cent. were credited to national banks, nearly 20 per cent. to State banks, 14 per cent. to mutual savings banks, 5 per cent. to stock savings banks, and nearly 20 per cent. to loan and trust companies. The great predominance of the national banking system among American banking institutions is shown by the following percentage distribute of total resources: National, 42.9; State, 16.2; mutual savings, 15.9; stock savings, 4.3; private, 0.7, and loan and trust companies, 19.9.

BANKING AND CURRENCY LAW. Of equal importance with the tariff revision was the revision of banking and currency laws by the Owen-Glass bill passed in December. Even while the tariff was before Congress, committees

of the House and Senate were busily engaged in drafting bills, and the House bill was passed in September. Legislation was universally recognized as urgent. The Aldrich-Vreeland act of 1908, whereby about a half billion dollars of emergency currency had been prepared, would have expired by limitation June 30, 1914. That act was passed as a temporary measure only, owing to the great diversity and immaturity of opinion regarding most desirable plans for permanent reorganization of the banking system. The wide spread discussion of the "Aldrich Plan" and of numerous modifications of it had, however, put the country through a process of education. This made possible ready agreement upon certain general and fundamental principles.

After signing the Underwood tariff bill early in October, President Wilson declared that "only half the journey" had been accomplished; that the country, having been freed from a condition making monopoly easy and even natural, it must next be freed from the financial power which creates monopoly. He greatly desired that a currency bill be passed before the close of the special session. This was not accomplished, though considering its great importance, passage of the banking bill through Congress was remarkably rapid.

The bankers of the country as represented by a great conference at Chicago in September, while approving many features of the House bill, desired to make numerous modifications in it. This same attitude was reflected by the annual meeting of the American Bankers' Association in Boston in October. The bankers greatly desired one Federal reserve bank instead of eight or twelve, they strongly urged that the membership of the Federal reserve board include at least three chosen by the banks, on account of the dangers of political control; they preferred that the entrance of a national bank into the system be voluntary instead of compulsory; and they strongly objected to making the note issues obligations of the United States, instead of obligations of the reserve banks alone. While the bill as finally enacted included none of these suggestions, numerous minor changes suggested by the bankers were included. Mr. Frank A. Vanderlip, president of the National City Bank of New York, drew up a measure which he endeavored to have substituted for the House bill. This called out acrimonious attacks by Democratic leaders. These leaders themselves were much divided on the question of the degree of centralization. Thus the Senate committee was in October evenly divided on the question of a central bank. Opposition, however, to a clear-cut central bank was too strong to permit its creation. Regarding the plan finally adopted, however, Mr. James J. Hill declared that it contained "the repudiation of the central bank idea in form and the acceptance of it in fact."

In November there were three bills before Congress—the House bill, the bill of Chairman Owen and five other Democrats of the Senate finance committee, and bill of five Republican members of that committee and the Democratic Senator Hitchcock. The Hitchcock measure was finally rejected in December, by a narrow margin. By serious attention, strenuous labor, and honest desire to serve the best interests of the country Senator Owen and Representative Glass, respectively chairmen of the Senate and House committees, succeeded in embodying in the Owen-

Glass bill the points receiving general approval among Democratic members of Congress.

This bill when finally enacted, December 22 and 23, received a vote of 298 to 60 in the House and 43 to 25 in the Senate. It was finally passed as a party measure, but support was drawn from all parties. In the House the affirmative included 249 Democrats, 35 Republicans, 13 Progressives, and 1 Independent. The negative included 57 Republicans, 1 Progressive, and 2 Democrats. In the Senate approval was given 39 Democrats, 3 Republicans, and 1 Progressive. The Republicans were Weeks of Massachusetts, Norris of Nebraska, and Jones of Washington. The Progressive was Poindexter of Washington. Passage was facilitated by the removal in conference of a provision for the guaranty of bank deposits. It was understood that a bill to provide such guaranty would be taken up later for separate consideration. After signing the bill on December 23, President Wilson wrote to Senator Owen and Representative Glass letters of congratulation in which he declared this the first great constructive measure designed to show that the Democrats know how to serve their country. The bill was widely approved by bankers and hundreds of banks wrote or telegraphed their desire to enter the new system.

While the new law went into effect immediately upon its approval some time was necessary to put it fully into operation. An organization committee, consisting of the Secretary of the Treasury, the Secretary of Agriculture, and the Comptroller of the Currency, had first to promulgate a plan of procedure. It was expected that all preliminary steps would require some months; meanwhile the Aldrich-Vreeland act, extended by the new law to June 30, 1915, would be available in case of emergency. The Owen-Glass law allowed national banks sixty days in which to make application for membership in the new system; and allowed a lapse of one year before the government should compel the dissolution of any national bank failing to join. The organization committee planned to hold hearings in a number of cities from Boston to San Francisco for the purpose of determining the most suitable places in which to locate the reserve banks. These hearings were to begin at New York, January 5, 1914.

Organization. The central body in the new system is the Federal reserve board at Washington. This will consist of the Secretary of the Treasury, the Comptroller of the Currency, and five others appointed by the President with the approval of the Senate. After the first appointments, which will be for terms of two to ten years, all will be for ten years. They will receive salaries of \$12,000 per year. At least two of them must be experienced in banking and finance, but none of them may own stock in a member bank or have banking affiliations while in office. One of the five appointed will be designated by the President as governor and another as vice-governor of the board. This board will exercise general control over the system and must make an annual report to the Speaker of the House. It will examine the reserve banks; supervise the issue and retirement of notes; in emergencies suspend for thirty days and thereafter for further fifteen-day periods the regulations regarding reserves; and permit, or on the vote of five members require, reserve banks to rediscount other reserve banks' paper at rates fixed by it;

fix the number and location of reserve and central reserve cities; remove or suspend officers and directors of reserve banks; and otherwise supervise the system. It has no power over the ordinary business of individual banks. The bankers of the country made a strong fight for control of the Federal reserve board on the ground that the system should be kept out of politics. But the Democratic leaders contended that this board was mainly supervisory in function and should not be controlled by banks supervised.

As an intermediary between the Federal reserve board and the individual banks there is created an advisory council composed of one representative from each reserve district. It will meet in Washington to advise with the Federal board concerning business conditions, discount rates, note issues, and reserve conditions.

There will be selected by the organization committee from eight to twelve cities where regional (Federal) reserve banks will be located. The entire country will be divided geographically with these cities as the centres of districts. All the national banks in a district must join the new system; State banks whose capital and reserves meet the requirements of the national banking act may upon vote of 51 per cent. of their capital stock become national banks and join the new system. Each local bank becoming a member must subscribe for stock in the regional bank of its district to the amount of 6 per cent. of its own capital and surplus. These subscriptions will make up the entire capital of the regional banks, which will thus so increase or decrease as to always equal 6 per cent. of the combined capital and surplus of member banks; except that, in case enough banks do not join to make the capital stock of a regional bank equal to \$4,000,000, the public may purchase such stock in amounts limited to \$25,000 for one person. But stock purchased by the public must be voted by a government representative on the board of directors of the regional bank. Subscriptions must be paid in gold or gold certificates. Member banks are required to pay on call for one-sixth of their subscription, one-sixth in three months, one-sixth in six months thereafter; and the other half may be called for by the Federal reserve board when needed. This stock is non-taxable and will bring 6 per cent. cumulative dividends. Profits over and above this will be divided between the creation of a surplus fund for the regional banks and the payment of a franchise tax to the government. Until a reserve bank's surplus fund equals 40 per cent. of its paid-in capital, one-half of the annual excess profits will go to the surplus; thereafter all will go to the government. What the government thus receives may be used at the discretion of the Secretary of Treasury to increase the gold reserve behind greenbacks or reduce the bonded debt. No member of Congress may be a member of the Federal board, a director of a reserve bank, or an officer or director of a member bank.

Federal Reserve Banks. Each of the reserve banks will be controlled by a board of nine directors, of whom three shall be chosen by the member banks; three by electors, chosen by the same banks, and representative of the commercial, industrial, and agricultural interests of the district; and three by the Federal reserve board. One of these latter will be designated

by the Federal board as chairman and Federal reserve agent for the reserve bank, and another as deputy chairman and agent. Both these must be experienced in banking affairs. By the manner of selecting these directors the member banks will have control of the reserve banks and thus of the practical and technical banking operations of the entire system. Their capital in \$100 shares will be owned by member banks, as above noted.

These banks may receive from member banks and from the United States deposits of lawful money, national bank notes, Federal reserve notes and checks and drafts upon solvent member banks payable on demand. They may do banking business with member banks only, unless authorized by the Federal reserve board to rediscount paper for one another. But they may buy or sell in the open market at home or abroad cable transfers and bankers' acceptances of certain kinds without the endorsement of member banks. Moreover they may deal in gold coin and bullion at home or abroad and make loans thereon; they may buy and sell government bonds and notes, and bills and revenue bonds and warrants of civil divisions of the United States, including irrigation, drainage, and reclamation districts. The regional bank may rediscount, that is buy at a discount, the "prime commercial paper" of any member bank, when the latter wishes to convert such assets into cash. The rediscounting provisions of the act are of especial importance because upon them depends very largely the efficacy of the new system to meet the varying needs of trade. "Any Federal (regional) reserve bank may discount notes, drafts, and bills of exchange arising out of actual commercial transactions," that is "issued or drawn for agricultural, industrial or commercial purposes." The Federal reserve board has power to determine the character of the paper thus eligible for discount, but no paper "issued or drawn for the purpose of carrying or trading in stocks, bonds or other investment securities, except bonds and notes of the government of the United States" shall be eligible. All paper eligible for discount at a regional bank must mature within ninety days from time of discount; except that paper drawn or issued for agricultural purposes or based on livestock and maturing within six months may be discounted to an amount to be determined later by the Federal reserve board. In the paper eligible are included acceptances based on import or export trade and maturing within ninety days, and drafts growing out of them and running not longer than six months from sight. The reserve banks may establish rates of discount subject to review by the Federal reserve board; they may maintain accounts for exchange purposes with one another; and they may establish agencies in foreign countries.

Reserves. The total reserve required of banks in the central reserve cities, New York, Chicago, and St. Louis, is 18 per cent. of demand deposits and 5 per cent. of time deposits. Six of the 18 per cent. must be kept in the banks' own vaults, 7 per cent. in the regional reserve banks, and the remaining 5 per cent. in either of these two places. For banks in other reserve cities 15 per cent. of demand and 5 per cent. of time deposits are required as reserve. During the first two years 6 per cent. must be kept in the banks' vaults, and afterwards only 5 per cent.; 3 per cent. must be kept in the

regional reserve bank during the first year and thereafter 1 per cent. additional each six months until 6 per cent. is there held. That portion of the 15 per cent. reserve not thus provided for may be kept for three years in other banks, in its own vaults, or in the regional banks; but after that time this portion must be kept in one of the latter two places. For country banks a total reserve of 12 per cent. of demand deposits, and 5 per cent. of time deposits is required. Of the 12 per cent., 5 must be kept in the bank's own vaults for two years, and 4 afterwards. For the first year 2 per cent. must be in the regional bank, but increasing 1 per cent. every six months thereafter until 5 per cent. is kept there. The unallotted portion of the total of 15 per cent. must be kept for three years in reserve city banks; thereafter it must be kept either in the bank's own vaults or in the regional bank.

Thus the regional banks would shortly hold minimum reserves equal to 7 per cent. of the deposits of central reserve city banks, 6 per cent. of those reserve city banks, and 5 per cent. of those country banks; and they might, after three years, have in addition reserves of 5 per cent. of the deposits of the first group, 4 per cent. of those of the second, and 3 per cent. of those of the third. These enormous funds plus government deposits will constitute the reservoirs from which the legitimate financial needs of the country will be met in times of monetary stress.

Note Issue. Probably the most debated features of the new law were those dealing with the manner of issuance of bank notes. The country was generally agreed that the bond-secured national bank currency must give place to a system responding more readily to the volume of business needs. But there was sharp difference of opinion as to the extent to which the government should have control of note issues and responsibility for note redemption. At one extreme were those who held that the banks alone should control and be responsible for the volume of notes issued; at the other were those who would give full power and responsibility to the government. The actual legislation was a compromise. The government will print the notes in denominations of \$5, \$10, \$20, \$50, and \$100. They will be known as Federal reserve or treasury notes, and will have distinctive design and serial numbers for each reserve bank. The notes are in the first instance to be placed in the custody of one of the three directors of each regional bank appointed by the Federal reserve board. Such directors will be known as Federal reserve agents. In order then to secure the notes the reserve bank will place some of its rediscount commercial paper in the hands of its reserve agent and receive notes of not greater value in exchange. As an additional security a bank must maintain for note redemption a reserve of gold equal to 40 per cent. of the par value of the notes it issues; but in this reserve may be included the bank's share in the redemption fund noted below and its deposits of gold or lawful money with another reserve bank. Reserve banks must also maintain in gold or lawful money, that is gold or greenbacks, a reserve of 35 per cent. of its deposits, in addition to the reserve against notes. If the note reserve falls below 40 per cent. a tax is imposed; this is added to the rediscount rate to member banks and is designed to check

an overexpansion of currency. In times of panic the Federal reserve board may, however, suspend these requirements in order to afford quick and temporary relief. One reserve bank may not pay out the notes of another, except under penalty of a 10 per cent. tax. This provision is designed to hasten the speedy retirement of notes as soon as they have served their purpose. In this manner the volume of notes is expected to rise and fall automatically with the rise and fall of business needs. In emergency the Federal reserve board may suspend this regulation in order to prevent money stringency.

The reserve banks must maintain with the United States Treasury a redemption fund in gold deemed by the Secretary sufficient for note redemption. From this the Treasury will redeem notes presented to it and return them to the issuing bank, as under the national bank system. The bank will then reimburse the redemption fund. A bank's deposit in this fund may be counted as a part of its 40 per cent. required reserve against its outstanding circulation. Because of this fund the Treasury is pledged to redeem in gold on demand all notes actually presented to it. It was on account of this pledge that opponents of the new law charged that it was tainted with fiat money folly; but redemption by the Treasury is merely incidental to final redemption by the issuing bank.

In the last days of debate on the bill various attacks, notably one by Senator Elihu Root, were made on it on the ground of dangerous inflation. Mr. Glass answered this by showing that the notes would have the following security: The 40 per cent. gold reserve; a reserve of 1000 per cent. of commercial paper; a first lien on all the resources of the regional banks; the double liability of stock holding banks; the pledge of the government; and the discretion of the officers of member banks, reserve banks, and the Federal reserve board.

Retirement of National Bank Notes. After two years and at any time for twenty years any member bank may retire its circulation in whole or in part by authorizing the Treasurer of the United States to sell government bonds on which such notes are based. The Federal reserve banks may be required to purchase such bonds to a total amount not exceeding \$25,000,000 per year; and in that case they may increase their own circulation by an amount equal to the par value of the bonds purchased. In exchange for 2 per cent. bonds available for note issue under the national banking act but upon which no circulation is based, the Secretary of the Treasury may issue one-year gold notes for one-half their amount and thirty-year 3 per cent. gold bonds for the remaining half.

Other Provisions. As an important step in the direction of improving agricultural credit (q.v.) the new law authorizes any member bank, except those in New York, Chicago, and St. Louis, to make loans on five-year farm mortgages up to 25 per cent. of their capital and surplus, or up to one-third of their time deposits, such mortgages not to exceed in amount one-half the value of the land mortgaged. By other sections any member bank with a capital of at least \$1,000,000 or any regional bank is authorized to establish branches in foreign countries. The object is to increase the facilities for American foreign trade.

CANADA. The Canadian banking law is regularly revised every ten years. It would ordi-

narily have been revised in 1910, but revision was postponed to 1913 owing to the failure of the Farmers' Bank. The new law extended the charters of the twenty-four existing banks to July 1, 1923. The principal innovations in the new act were: (1) increased protection against malpractices; (2) extension of the bank's authority to make loans to farmers; and (3) increased power of note issue. In order to insure greater safety the new law provides additional safeguards against fraudulent organization, requires more detailed remarks and compels the banks to submit to an annual share-holders audit. This latter requirement was opposed by a member of the banks. They argued that the present auditing system by experts is effective; that the banks themselves are deeply interested in maintaining their own soundness; that the previous system located all responsibility with the bank directors instead of dividing it with the share holders. They pointed out also that the banks incur heavy expense to insure thorough inspection, as illustrated by the Canadian Bank of Commerce, the inspection of which, including 370 branches, cost \$102,700, in 1910. On the other hand it was shown that there had been a number of failures; and that the public had no means of judging a bank's soundness except by returns made by the bank. The authorization of loans to farmers on their threshed grain in storage or in transit upon cattle was in obedience with the demand of middle and western Canada. It was expected, however, to be of benefit to farmers throughout. The most important feature of the new law is the creation of the central loan reserves. Under the previous act banks could issue notes to the amount of their unimpaired paid-up capital; with the provision that during the crop-moving period—September to February inclusive—they might issue an additional 15 per cent. of their combined capital and surplus. These features remain unchanged, but each bank may now issue any amount of notes provided that for any surplus over and above the amounts thus authorized the bank deposit with a board of trustees at Montreal gold or dominion notes to the full amount of the surplus notes. The bank, however, must pay a tax of 4 per cent. on the 15 per cent. of extra notes issue during the crop-moving period, but there is no tax upon the surplus notes based on gold or legal tender notes. This new feature is expected to create a considerable gold fund in Montreal, which add greater safety and elasticity to the Canadian banking system.

NEW YORK. The Van Tuyl commission was authorized by the New York legislature and appointed by superintendent of banking to revise the State banking laws. It met in September and chose Mr. A. Burton Hepburn of the Chase National Bank and chairman of the currency committee of the American Bankers' Association as chairman. It was to report by February 1, 1914.

BAPTISTS. According to statistics of the *American Baptist Year Book* for 1913, the total number of Baptists in the United States was 5,529,573, and the total number in the world was 6,516,483. The Baptists in the United States are divided loosely into two large bodies and several smaller ones. The two main bodies of the regular denomination are the Northern and Southern. The most important of the smaller bodies with their communicants

in 1913 are the general Baptists, 33,600 communicants; the Primitive Baptists, 102,311; Primitive Baptists, colored, 35,076; United Baptists, 13,698. In addition there are several bodies, including the Seventh Day Baptists, the Church of God, and the Saints of Christ. The Northern Baptists have 1,211,426 communicants, with 9715 churches and 8223 ministers. The Southern Baptists have 2,304,724 communicants, 22,795 churches, and 14,625 ministers. Among the general societies under the support of the regular denomination are the American Baptist Foreign Mission Society, which has general charge of the foreign missions; the American Baptist Publication Society, the American Baptist Home Mission Society, which has charge of the home missions, the Women's American Baptist Foreign Mission Society, and the American Baptist Education Society. Missions were carried into nearly all fields in which countries are assigned. There are under the auspices of the denomination 98 colleges, 10 theological seminaries, 96 academies, seminaries, institutions, and training schools.

For several years a movement has been under way to bring about a union between the Baptists and the Free Will Baptists. For a discussion of this, see BAPTISTS, FREE.

The Northern Baptist convention and the South Baptist convention are bodies which have general charge of the different activities of the denomination. Both bodies met in 1913. The Northern Baptists' convention met in May, and addresses were made by Dr. Shailer Mathews, C. F. McFarland, and others. A resolution was passed calling upon the authorities of the Panama-Pacific Exposition to keep it free from commercialized vice. In the meeting in 1912, a movement for raising three million dollars for interests of the denomination was to be on foot, and reports of the progress of this movement were heard at the meeting. The Southern Baptists' convention met also in May. It voted to abandon the international Sunday school series and appointed a commission to enter the social service work. Among other interesting events in the history of the denomination during the year was the observance in Brooklyn of the centennial of the birth of Rev. Adrinon Judson in August. The weekly papers, the *Watchman* and the *Examiner*, were consolidated during the year.

BAPTISTS, FREE. Since October, 1911, a process of amalgamation with the Northern Baptists has been going forward. This is being done on a platform called the "Basis of Union," which was formulated in 1908 by joint committees representing the general conference of Free Baptists and the third national missionary organization of the Baptists—the American Baptist Foreign Mission Society, the American Baptist Home Mission Society, and the American Baptist Publication Society. The first step taken of an official character was the consolidation of home and foreign mission interests. The general conference of Free Baptists retains its legal existence, and held its 35th session at Ocean Park, Me., on July 15-18, 1913. It has, however, transferred its missionary and general denominational activities very largely to the three Baptist societies named above. In the different States, the union of State organizations has progressed more rapidly during 1913 than in any previous year. In the following States, union in some practical form has

already been accomplished—Rhode Island, Vermont, New York, Wisconsin, Iowa, Minnesota, and California. Statistics which show a falling off in numbers of the Free Baptists really indicate the result of this union with the regular Baptists. The denomination in 1913 had 65,440 communicants, 1110 churches, and 805 ministers. See also BAPTISTS, and RELIGIOUS DENOMINATIONS AND MOVEMENTS.

BAR ASSOCIATION, AMERICAN. The annual meeting of the association was held in Montreal on August 31, 1913. The association had as its guest Viscount Haldane, the lord chancellor of Great Britain. On September 1, Chief Justice White delivered a speech of welcome to Lord Haldane, to which he replied in a notable address. The association was welcomed to Montreal by Mr. Borden, premier of Canada. Among the important addresses made were those by F. B. Kellogg, on the treaty making powers of the United States, and by former President Taft on the selection and tenure of judges. A resolution was passed commending President Wilson's policy in relation to Mexico. Mr. Taft was elected president of the association for 1913. The association held a joint session of the American Institute of Criminal Law and Criminology. The secretary of the association is George Whitelock, and the treasurer F. E. Wadhams. The membership in 1913 was about 7500.

BARBADOS. A British colony; one of the Caribbee Islands, with an area of 166 square miles and a population (1911) of 171,892. Bridgetown is the chief town and port, with (1911) 16,648 inhabitants. Sugar-cane is cultivated on about 64,000 acres; the number of sugar mills in operation in 1911 was 330, with an output for the year of 23,524 hogsheads of sugar and 84,887 puncheons of molasses (\$39,899 and 77,722 in 1910). Cotton export to the United Kingdom in 1911, 740,269 lbs., valued at \$43,182. There is a railway (28 miles) from Bridgetown to St. Andrew. Imports and exports for the year 1911 were valued at \$1,539,710 and \$1,005,931 respectively (\$1,345,194 and \$1,088,830 in 1910). Revenue and expenditure (1911-12), \$221,906 and \$215,697 (\$213,298 and \$211,949 in 1910-11). Tonnage entered and cleared, 3,475,511 (2,620,223 British). Customs revenue (1911-12), \$131,683. The debt, March 31, 1911, was \$422,900 (sinking fund, \$90,775). Sir Leslie Probyn was governor in 1913.

BARCA. See TRIPOLI.

BARGE CANAL. See CANALS.

BARLEY. The barley production of the world in 1913 was estimated at 1,450,000,000 bushels, or about equal to the production in 1912. The United States produced about 50,000,000 bushels less than 1912, but this shortage was offset by increased yields in several of the principal barley producing countries and notably in Russia. The leading countries, exclusive of the United States, and their estimated yields were as follows: Russia 500,000,000, an increase of about 35,000,000 bushels as compared with the preceding crop, Germany 161,000,000 bushels, British India 105,000,000, Japan 95,000,000, Austria 83,000,000, Hungary 78,000,000, United Kingdom 68,000,000, Spain 64,000,000, and France 50,000,000 bushels. These countries with the United States produce the bulk of the world's barley supply. Turkey also ranks high as a barley producer, but owing

to unsettled political conditions reliable data on the crop of 1913 are not available. China, which also devotes a relatively large acreage to the crop, does not publish data regarding it. With the exception of drouth in the United States weather conditions in the different countries were generally favorable, although in parts of southeastern Europe heavy rainfall during harvest reduced the quality of the grain by injuring its color.

The United States produced 178,189,000 bushels on 7,499,000 acres, as compared with 223,824,000 bushels on 7,530,000 acres in 1912. The average yield per acre in 1913 was 23.8 bushels and in 1912, 29.7 bushels. The reduction in total production as well as the lower average yield per acre were due to the severe drouth in the Mississippi Valley States, where the crop is largely grown. In some sections the crop was only one-third of normal. Of 34 States reporting yields, the following, leading in production, produced the larger portion of this year's crop: Minnesota 34,800,000 bushels, California 33,150,000, North Dakota 25,500,000, Wisconsin 18,125,000, South Dakota 16,765,000, and Iowa 10,000,000 bushels. Only three States had over 1,000,000 acres in barley—Minnesota, 1,450,000 acres, and California and North Dakota each 1,275,000 acres. The average yield per acre ranged from 8 bushels in Kansas to 42 bushels in Idaho. The farm price December 1, 1913, was 53.7 cents per bushel, as compared with 50.5 cents on the same date the year before. On this basis the production of 1913 was valued at \$95,731,000 and the crop of 1912, \$112,957,000. The average price for the year 1913 was 55 cents per bushel and the average price for the past 5 years was 60 cents per bushel.

BARNARD COLLEGE. See COLUMBIA UNIVERSITY.

BARNES, WILLIAM. An American lawyer and insurance specialist, died February 23, 1913. He was born at Pompey, N. Y., in 1824, and was educated at Manlius Academy. In 1846 he was admitted to the bar and for many years he was special counsel for the banking department of the State. From 1860-70 he was superintendent of insurance of New York State. In 1872 he was appointed by General Grant a delegate to the International Statistical Congress at St. Petersburg. He was special counsel for the city of New York in many important cases, and he superintended the compilation of several volumes of the insurance statistics, and was editor of the first New York State valuation tables and condensed insurance reports. He was the father of William Barnes, Jr., one of the Republican political leaders of New York State.

BARNETT, SAMUEL AUGUSTUS. An English clergyman and social worker; died June 17, 1913. He was born in Bristol, England, in 1844, and was educated privately and at Wadham College, Oxford. In 1872 he was appointed vicar of St. Jude's White Chapel, a post which he held for 22 years. A few years after he had settled in this parish, a study of the condition of the poor, conducted by Edward Dennison and others, began to excite interest among philanthropists. Canon Barnett became one of the most enthusiastic workers in this movement, and was one of the chief supporters of Arnold Toynbee. He was one of the most prominent among those who were endeavoring

to better the condition of the poor in London. After the death of Toynbee, a number of his friends founded Toynbee Hall in his memory, and at this Barnett became the first warden. He retained this post until 1906. Toynbee Hall was the first example known of the institution or university settlement, and Mr. Barnett carried on its work with great success. In 1893 he was made canon of Bristol, and in 1906 was transferred to Westminster. His published writings include *Practicable Socialism* (in collaboration with Mrs. Barnett, 1893); *The Service of God* (1897); *Religion and Progress* (1907); *Towards Social Reform* (1909); *Religion and Politics* (1911).

BAROTSELAND. See RHODESIA.

BARTON CABINET. See FRANCE, *History*.

BASEBALL. The Philadelphia American League team, known as the Athletics, in 1913 for the second time in three years captured the highest honors in baseball. The New York National League team, the Giants, for the third successive year won the pennant in their league, but were wholly outclassed in the series with the Athletics for the world's championship, winning only one game of the five played. The total attendance at the world's series was 150,992 and the receipts aggregated \$325,980. A composite score of the games shows that the Athletics both outbatted and outfielded the Giants. The score of each contest follows: Philadelphia 6, New York 4; Philadelphia 0, New York 3; Philadelphia 8, New York 2; Philadelphia 6, New York 5; Philadelphia 3, New York 1.

In the early part of the National League race Philadelphia and Brooklyn played excellent ball and it was not until July that the Giants went to the front. The final standing of the clubs in the National League was: New York won 101, lost 51; Philadelphia won 88, lost 63; Chicago won 88, lost 65; Pittsburgh won 78, lost 71; Boston won 69, lost 82; Brooklyn won 65, lost 84; Cincinnati won 64, lost 89; St. Louis won 51, lost 99.

The Philadelphia Athletics had little trouble in gaining the American League pennant. The only team to afford them any serious opposition was the Washington. Cleveland made a good showing during the first part of the race but injuries to valuable players soon put the team out of the running. The Boston Red Sox, winners of the world's championship in 1912, had to be contented with fourth place. The standing of the American League clubs follows: Philadelphia won 96, lost 57; Washington won 90, lost 64; Cleveland won 86, lost 66; Boston won 79, lost 71; Chicago won 78, lost 74; Detroit won 66, lost 87; New York won 57, lost 94; St. Louis won 57, lost 96.

The leading pitcher of the National League as based on the average number of runs scored per nine-inning game was Mathewson of the New York Giants, his average being 2.06. In the American League Johnson of the Washington team won 36 out of 43 games and allowed an average of only 1.09 runs per game. The leading batter of the National League was McDonald of Cincinnati and Boston, his average being .365. Tyrus Cobb of Detroit again won the batting laurels in the American League with the magnificent average of .390.

Noteworthy events in major league history in 1913 were the election of Governor John K.

Tener of Pennsylvania as president of the National League and the organization of the Baseball Players Fraternity.

Two teams made up principally of players from the New York Nationals and the Chicago Americans started on a trip around the world in November.

The pennant winners in the more important minor leagues in 1913 were: International, Newark; American Association, Milwaukee; Southern, Atlanta; Tri-State, Wilmington; Eastern Association, Hartford; Pacific Coast, Portland; New England, Lowell.

Yale had the best team among the colleges, although she lost the series with Harvard and was defeated by Pennsylvania and Williams. Brown was generally ranked second and Harvard third, although there is no satisfactory method of determining the college championship, many of the best teams failing to meet each other. The scores in Yale's principal games were: Yale 2, Harvard 0; Yale 3, Harvard 4; Yale 5, Harvard 6; Yale 0, Princeton 0; Yale 5, Princeton 4; Yale 4, Pennsylvania 5; Yale 13, Pennsylvania 5; Yale 4, Pennsylvania 2; Yale 4, Brown 2; Yale 6, Brown 4; Yale 4, Cornell 1; Yale 3, Cornell 0; Yale 18, Georgetown 1; Yale 3, Georgetown 0; Yale 7, Holy Cross 4; Yale 6, Holy Cross 0; Yale 0, Williams 2; Yale 6, Columbia 4; Yale 4, Virginia 2; Yale 14, Amherst 1; Yale 6, Trinity 0; Yale 5, Vermont 0.

Brown defeated Tufts 3-0; Colgate 14-2; Princeton 8-1; Harvard 9-4; Colby 8-2. Brown was defeated by Yale 2-4, and 4-6; and by Holy Cross 0-5.

Harvard defeated Yale 4-3 and 6-5; Princeton 7-0; Pennsylvania 3-1; Amherst 5-0; Williams 5-1; Syracuse, 3-0; Columbia 6-4; Bowdoin 6-4; Maine 7-3; Vermont 4-1. Harvard was defeated by Yale 0-2; U. S. Naval Academy 7-9; Colby 2-5; Lafayette 2-4; Holy Cross 5-7; Brown 4-9; Pennsylvania 3-4.

Princeton defeated Georgetown 4-0; Rutgers 9-3; Villanova 5-4; Columbia 7-6; Cornell 7-1 and 11-4; Williams 8-3; Lafayette 3-1. Princeton was defeated by Yale 4-5; Harvard 0-7; Georgetown 1-7; Pennsylvania 9-12 and 0-2; Brown 1-8 and 1-3; Virginia 1-6 and by Amherst 0-6.

BASKETBALL. Cornell in 1913 succeeded in wresting the supremacy in basketball from Columbia which had held the intercollegiate championship for two years in succession. Cornell lost only one league game out of eight played. The standing of the other teams was: Princeton won 4, lost 4; Pennsylvania won 3, lost 5; Dartmouth won 3, lost 5; Columbia won 3, lost 5. Wesleyan, although not a member of the league, made an excellent showing and her team is entitled to rank second among the Eastern colleges. The championship of the Middle Western Conference League was won by Wisconsin, which went through its schedule without defeat. The records of the teams follow: Wisconsin won 11, lost 0; Northwestern won 8, lost 4; Illinois won 7, lost 5; Purdue won 6, lost 5; Ohio State won 5, lost 5; Minnesota won 2, lost 8; Iowa won 1, lost 7; Indiana won 0, lost 10.

The A. A. U. championship was won by the Armour Square Five of Chicago. The Carlton Club of Hoboken, N. J., and the Winton Club of West Hoboken tied for first place in the Hudson County Professional League of New

Jersey, each team winning 26 games and losing 8.

BASUTOLAND. A British South African dependency administered under the control of the governor-general of the Union of South Africa (q.v. area, etc.), though not a part of the Union. Masern is the capital, with 861 native and 500 white inhabitants (estimated). For trade purposes Basutoland combines with the Union. Revenue (1910-11), £145,500; expenditures, £134,888. Total area of the country, 11,716 square miles; population (1911), 404,507 (1396 whites). Resident commissioner (1913), Herbert Cecil Sloley.

BATHS. See HYDROTHERAPY.

BATHS, MUNICIPAL. The International Congress on Public and School Baths, which was held at Scheveningen, the Hague, in August, 1912, stimulated the general awakening to the need of public baths in both Europe and America, and at the same time proved how widespread was the movement. According to the report of the congress, published in 1913, three hundred delegates from eleven countries were present, and although the United States was not officially represented, there were three delegates from the American association for promoting hygiene and public baths and others from several American cities. The progress of the movement in the United States was summarized by William Paul Gerthard, who presented statistics tending to show that New York, Chicago, Boston, and Baltimore had done most for city baths. A description was presented of the portable baths which were introduced by the city of Baltimore in 1908. It aroused much interest and the municipality of the Hague at once voted to try the experiment.

The portable baths just mentioned have proved such a successful innovation in Baltimore and were being so widely copied by other American cities that the history of their development and operation is of interest. The following description is taken from the reports of the Baltimore bath commission. Late in the summer of 1908 the commission decided to establish, as an experiment, a cheap portable bath. Accordingly, in a tent, on a vacant lot, a temporary connection with the city water mains was made and within a few days cold shower baths were given to about 500 boys and men. The tent was divided by muslin strips into three sections; the office, dressing room, and bathroom proper. It was provided with a rough floor which had open spaces in the bathing section, through which the water ran back to the nearby gutter. Overhead was erected a wooden frame carrying water pipes and four shower heads regulated by a valve within the reach of each bather. The entire plant cost about \$150. So great was the popularity and usefulness of the bath-tent that the following season a more ambitious scheme of portable bathhouses, which has been followed each succeeding summer, was adopted. The enclosures are of wood and galvanized iron. A small lean-to contains an egg-shaped coal stove with a water jacket for heating water. Nearby is a 100-gallon storage tank. The interior of the bathhouse is divided into seven compartments. The house is collapsible into about seventy-five sections, each about five by eight feet, easily handled by two men. The entire work of setting up takes three men four days.

Another style of portable house has been adopted which is not collapsible, but is erected in two parts, each about nine by fourteen feet, joined together by bolts. The labor of setting this house up is much less than of the other and it has proved quite as satisfactory. Blue print drawings of those three types of portable baths will be sent to any city by the Baltimore bath commission on application. Portable baths are especially valuable for play grounds, camps, and other temporary gatherings and also as a permanent substitute where more elaborate bathing facilities are unattainable.

The Baltimore bath commission has also served as a model in several other particulars and so constant have been the inquiries from other municipalities as to its methods that it has established an educational department and its members are prepared to give lectures on municipal baths to meet the demand from improvement societies, schools, and colleges.

BATTERIES. See ELECTRIC BATTERIES.

BATTLESHIPS. There was apparently no diminution in the number and size of battleships under construction during 1913 by the leading naval powers of the world. The comparative tables printed under NAVAL PROGRESS (q.v.) indicate the relative strength of the powers in the struggle for sea supremacy, while reference here will be made to special features of design, construction, and armament.

DISPLACEMENTS. Displacements were still increasing. The two American battleships of the *Pennsylvania* class were to have a mean trial displacement of 31,400 tons. The service displacement of the English *Queen Elizabeth* class was not to be much less, as their construction-displacement was put at 28,500 tons, and this is, according to the British usage, several thousand tons less than the actual service displacement. The displacement of some of the largest ships building or proposed in 1913 were:

Germany	—29,000 tons, estimated (T)
Italy	—29,510 tons (<i>Morosini</i> class)
Japan	—30,000 tons (<i>Fuso</i> class)
Russia	—32,500 tons (<i>Borodino</i> class)
England	—28,500 tons, estimated (<i>Royal Sovereign</i> class, 1913 programme, said to displace about 3000 tons less than the <i>Queen Elizabeth</i>).

DISTRIBUTION OF HEAVY GUNS. All navies had adopted the centre line turret; but a great diversity existed in the method of gun distribution. Twin and triple turrets were sometimes used alone, and sometimes in combination; the French *Normandie* class had three quadruple turrets, while the *Tourville* class was to have four quadruple turrets. The return to a powerful intermediate battery had become general; and as this battery, on account of the increased range of the torpedo, must serve to repel attack by torpedo craft, the torpedo defense batteries proper (guns of small calibre) were gradually disappearing, as their efficiency in battle seemed very doubtful in view of their generally unprotected positions. On the other hand guns for repelling the attack of airships had been introduced into most of the fleets.

VARIOUS FEATURES. Frahm rolling tanks and Gyro compasses were successfully introduced in various navies.

Launching weights continued to increase; that

of the *Warspite* was 12,000 tons; that of the *Tiger*, 13,000 tons.

The use of oil fuel in combination with coal had an increased extension, and for the newest American ships of all classes oil alone was provided.

SPEED. There was no noteworthy increase in any class of ship. The speed of battleships remained about the same, and even for the most recent, averaged about 21 knots. The five English ships of the *Queen Elizabeth* class were an exception; they were to make 25 knots and thereby acquire the character of battle cruisers, whose rôle this series of battleships is naturally designed to take as the fast wing of the battle line. The first lord of the British admiralty said in July that there was no intention to raise the ordinary average speed of the line of battle, which remains at the maximum of 20 to 21 knots.

ARMAMENT. The following paragraphs summarizing the development of battleship ordnance indicate the progress being made in the various navies.

Austria. The second dreadnought division consisting of 3 ships to replace the obsolete *Monarch* class, and 1 to replace a ship of the *Hapsburg* class, to be commenced early in 1915, were to have a main armament of ten 14-inch guns. The displacement of these battleships is 25,000 tons; speed 23 knots.

England. Each of the first 10 dreadnoughts was armed with ten 12-inch guns, the 13.5-inch gun being adopted in 1909. The battleships of the 1912 programme were to have eight 15-inch guns, and also sixteen 6-inch. The return to a special torpedo defense battery of twelve 3-inch guns was worthy of note. The 6-inch guns of the *Queen Elizabeth* are well protected by armor; and the forward guns are arranged in echelon from the centre line to the ship's side so as to give them ahead fire. It was said that the battleships of the 1913 programme (*Royal Sovereign* class) were to have ten 15-inch guns, with the same intermediate battery as the *Queen Elizabeth*. All the latest ships, commencing with the *Benbow* class were to have 8 torpedo tubes instead of 5.

France. The progress of France can best be shown in tabular form:

Class	Broadside		Displacement (Tons)
	Guns	Lbs.	
Jean Bart	10—12"	= 9,700	23,095
Bretagne	10—13.4"	= 11,900	23,117
Normandie	12—13.4"	= 14,280	24,830
Tourville	16—13.4"	= 19,040	29,500

The number of 5.5-inch guns had increased from twenty-two in the *Jean Bart* and *Bretagne* classes, to twenty-four in the *Normandies*, and to twenty-eight in the *Tourvilles*. No torpedo defense guns of smaller calibre were provided after the *Jean Bart* class. Eighteen-inch torpedoes are still used. The four battleships of the 1915 programme were to be named *Tourville*, *Lyon*, *Lille*, and *Duquesne*, and were to carry a new 13.4-inch gun, firing a new projectile with great initial velocity.

Germany. Germany held that the 11 and 12-inch Krupp guns were equal to the English 13.5-inch and 14-inch guns of the same date, for all practical battle purposes. After England adopted the 15-inch gun, Germany was forced to take the same step; and decided to

give the two German battleships of the year 1913 the same armament as that of the five English ships of the year 1912, that is, eight 15-inch and sixteen 6-inch. The torpedo armament of the latest ships consisted of 20-inch torpedo tubes.

Italy. The first of Italy's new type battleships (Ferrati's plans) was to be laid down in January, 1914. Its armament was eight 15-inch guns, in four axial turrets, twenty 6-inch guns in casemates, and twenty 3-inch guns. The gun trials of the *Dante Alighiere* (12-inch in four triple turrets) were officially reported as entirely satisfactory—no damage was done to ship, guns, or mounts.

Japan. The four Japanese battleships of the *Fuso* class were to be armed with twelve 14-inch guns, sixteen 6-inch guns, and eight 21-inch torpedo tubes.

United States. The United States retained the 14-inch gun for the *Pennsylvania* class, which carry twelve; while the *Oklahoma*, *Nevada*, *Texas*, and *New York* carry ten; with an intermediate battery of twenty-two 5-inch guns; and four 21-inch submerged torpedo tubes.

ARMOR. Armor for battleships in 1913 had increased beyond the thickness of the previous year, and was from 13-inch to 15-inch in thickness, a result of the increase in gun calibre. Against the attack by bombs from aircraft, the decks and smoke-pipes of the large new battleships were being given armor protection.

COMPLEMENTS naturally increased with increased displacements; and would reach 1300 men in the Italian battleship to be laid down in January, 1914.

BATTLE CRUISERS. It happened that each of three great naval powers launched a battle cruiser within a few days of each other. The British battle cruiser *Tiger* was launched by Messrs. John Brown and Company at Clydebank on December 15, 1913. She was the last battle cruiser in hand, as vessels of the *Queen Elizabeth* type, though faster than all previous battleships, were officially classed as battleships. The *Tiger* was the last of the five armored ships of the 1911-12 programme, and had been building since June 20, 1912. The German *Lützow* was launched at Danzig on November 29, and the Japanese *Kirishima* at Nagasaki on December 1. No official information was given out about these ships, but from press reports it appeared that they were about the same size, or between 27,500 and 28,500 tons displacement, and all were credited with a speed of twenty-eight knots. It may be recalled that this was 10,000 tons and three knots more than the original battle cruisers of the *Invincible* class. The *Kirishima* carried eight 14-inch guns; the *Tiger* eight 13.5-inch guns; and the *Lützow* eight 12-inch guns. The *Kirishima* also carried sixteen 6-inch guns; the *Tiger*, twelve 6-inch; and the *Lützow*, fourteen 6-inch guns. It was reported that the *Kirishima* had eight torpedo tubes, while the British and German vessels were understood to have only five. The *Lützow* was stated to have an 11-inch armor belt, whereas the British and Japanese ships have 9-inch and 10-inch, respectively. Reduced armor protection was a feature of the original battle cruiser design in England; but other powers did not reduce protection to the same extent. In all three ships the secondary guns

© E. MULLER, JR.

U. S. BATTLESHIP "TEXAS."
THE FIRST AMERICAN SUPER-DREADNOUGHT.

are placed behind armor of a thickness approximating their calibre.

All three vessels were building at private dock yards; and the *Lützow* had been the shortest time on the stocks. She had occupied fifteen months, the *Tiger* eighteen months, and the *Kirishima* twenty-one months. The other most notable feature about Germany's new ship was the reduction of the number of heavy guns to eight. The *Lützow* and *Derfflinger*—the latter launched in June, 1913—had eight 12-inch guns, but their predecessors carried ten 11-inch guns. This reduction in numbers in favor of an increase in calibre made them correspond more to the British vessels. Like all earlier battle cruisers in the British navy, the *Tiger* was fitted to burn both oil and coal, and the *Lützow* and *Kirishima* were like her in this respect. The *Tiger* was also, like her predecessors, propelled by turbine machinery, but was the first to have turbines of the Brown-Curtis instead of the Parsons type. Russia adopted the 14-inch gun for the battle cruisers of the *Borodino* class, commenced in 1912 (displacement, 32,500 tons; armament, nine 14-inch guns, twenty-one 4.7-inch guns).

BAVARIA. See GERMANY.

BAVARIAN REGENCY, END OF. See GERMANY.

BAYLES, JAMES COPPER. An American engineer and editor, died May 7, 1913. He was born in New York in 1845 and received a technical education. From 1862-64 he was lieutenant of the United States artillery. In 1865 he became editor of the *New York Citizen*, continuing in this position for two years. In 1868-69 he edited the *Commercial Bulletin*, and from 1870-89 the *Iron Age* of New York. He made a study of electro-metallurgy, microscopic analysis of metals, sanitation, and mechanical hygiene, and wrote much on these subjects. In 1888 he was president of the health department of New York City.

BEANS. See HORTICULTURE, *Plant Breeding*.

BEAUMETZ, DUJARDIN. A French public official and art curator, died September 27, 1913. He was born in Paris in 1852. At an early age he began his political career and served with distinction as under secretary of fine arts under many ministries. In 1889 he was elected a member of the Chamber of Deputies, and in 1912 became a senator. He was under secretary of fine arts at the time the "Mona Lisa" was stolen from the Louvre. The public resentment against him on account of this incident was so great, that he was obliged to resign his office.

BEAUX-ARTS ARCHITECTS, SOCIETY OF. An association formed by the American graduates of the École des Beaux Arts in Paris. It comprises a system of education which includes the establishment in different cities of the United States of ateliers or schools in which instruction in architecture may be obtained. The instruction is based on that given in the École les Beaux Arts, and many colleges and universities throughout the country avail themselves of the programme of the society used in its courses of instruction. Schools are formed in each city by groups of students who wish to carry on the study of architecture. A master or patron, whose work is given free, is chosen or appointed, and the school is supported by contributions of the students. Each year the com-

mittee on education of the society issues a certain number of programmes which include problems to be worked out by the different schools. These competitions are designated "Class A" and "Class B" competitions. The society awards four prizes: The Warren Prize, offered for general excellence in planning a group of buildings; the Pupin Prize, the gift of Professor M. I. Pupin of Columbia University, offered for decorative treatment of some appliance; the Goelet Prize, the gift of Mr. Robert W. Goelet, for excellence in planning a city block; and the Bacon Prize, the gift of Mr. Robert W. Bacon, for the greatest number of honors obtained in "Class A." Mr. Bacon also offers each year a Paris prize, the winner of which is chosen to pursue his studies in the first class in the École des Beaux Arts, Paris. Regulations providing for this have been adopted by the French minister of public instruction and fine arts. The winner of this prize receives \$250 quarterly for two years and a half, dating from his departure for Europe.

BEBEL, FERDINAND AUGUST. A German Socialist leader and writer, died August 13, 1913. He was born at Cologne in 1840 in the artillery barracks where his father was a non-commissioned officer of the army. He learned the profession of lathe turner, but his chief interest was in politics. At the start of his political life he was a Liberal, opposed to the socialistic agitation of Lasalle, who was at that time becoming prominent. A careful reading of Lasalle's writing, however, resulted in his conversion to Socialism in 1865. He became so zealous a Marxian Socialist, that he was soon arrested and put into prison. In 1872 he was again arrested in company with the socialistic propagandist Liebknecht, and both spent two years as prisoners in the fortress of Hubertusburg. Counting this and another term in 1886, he was in prison for a total of fifty-seven months. This time he spent in study, which included self-teaching in Greek until he could read Homer. During his second term in prison, he first thought out his first and most successful book, *Die Frau*, which, with John Stuart Mill's *The Subjection of Woman*, is perhaps the most widely read of books on the woman question. This book was his most successful publication. It was translated into fifteen languages, and had a large sale throughout Germany. After the passage of the Socialist law in 1878, and the extension of the minor state siege to the city of Leipzig, Bebel was forbidden residence in that city. He thereupon sold out his business of carpenter and joiner and devoted himself thereafter to the socialistic propaganda. In this he was so successful that Bismark considered him the arch-enemy of the nation, and threw every obstacle in the way of his speaking and writing. Bebel severely criticized the annexation of Alsace and Lorraine after the Franco-Prussian War, and his frankness in voicing his opinions increased his unpopularity with the ruling powers. He criticized also the exploits of a German army in China, and alleged German atrocities in South Africa. He repeatedly censured the emperor, Wilhelm II., and once intimated that he thought the latter insane. With Dr. Karl Liebknecht and Paul Singer, he founded the Socialist Democratic party in Germany, and for a number of years was its leader. He was

a member of the Reichstag from 1867, and was the third and oldest member of that body. In recent years Bebel experienced some differences with other leaders of his party because of his opposition to what he called their opportunism. In turn they denounced him as a dictator and a despot. In spite of aggressiveness, Bebel could at times show moderation. An example of this was in 1906, when he opposed a general strike of the working men, arguing in a temperate speech, that defeat would be certain, and the party would emerge only to find itself under the ban of special legislation. He was an eloquent speaker, and his bitter attacks on the government delivered in the Reichstag always insured a crowded attendance in that body. He had a remarkable influence over the four million persons composing the Socialist party in Germany. In addition to his book on woman, he wrote *Unsere Zeile; Der deutsche Bauernkrieg; Christentum und Socialismus; Die Frau und der Socialismus; Charles Fourier*, and others. See also *SOCIALISM, passim*.

BECHUANALAND. A dependency of the Cape of Good Hope Province in the Union of South Africa (q.v. for area, etc.). Revenue (1911-12), £59,305; expenditure, £65,936. Resident-commissioner (1913), Lieutenant-Colonel F. W. Panzera, who resides at Mafeking, in the Cape province.

BECKE, GEORGE LOUIS. An Australian author, died February 18, 1913. He was born in New South Wales, in 1840. His boyhood and youth were spent as super-cargo and trader in the South Seas. In 1893 he began to write, and his first book, *By Reef and Palm*, was published in 1894. This was followed by *The Ebbing of the Tide* (1896); *His Native Wife* (1896); *Pacific Tales* (1897); *Wild Life in the South Seas* (1897); *Tom Wallis* (1900, 1913); *The Adventures of Louis Blake* (1909); and by other books dealing with life in the South Seas. He had a remarkable gift for depicting graphically the strange life of the South Seas, and his best work has, not without reason, been ranked with that of Kipling and Dawson. In addition to his literary work he devoted considerable time to ethnological studies.

BEDFORD, SIR FREDERICK GEORGE DENHAM. An English admiral, died January 30, 1913. He was born in 1838, and entered the navy as a cadet in 1852. During the Crimean War he served in the Black Sea. He became a lieutenant in 1859, a commander in 1871, and a captain in 1876. In 1886 he was appointed in command of the training ship *Britannia*, where he remained for three years. He then became junior sea lord of the admiralty; and in 1891 rear-admiral. The following year he left the admiralty to become commander-in-chief of the Cape of Good Hope and west coast of Africa station. During his tenure of this office he led several expeditions against slave-raiding and rebellious native chiefs on the west coast. In 1895 he returned to England to take up the appointment of second sea lord. A few years later he was promoted to be rear vice-admiral. In 1899 he was appointed commander-in-chief of the North American and West Indies station, where he served until he was made governor of West Australia, in 1893, which post he filled for six years. On his retirement in 1909 he was made a G.C.M.G. He was the author of several useful naval hand books, including *The Sailors' Pocket Book*; *The*

Sailors' Hand Book; and *The Sailors' Ready Reference Book*.

BELGIUM. A constitutional monarchy bordering on the North Sea; one of the smaller European states. Capital, Brussels.

AREA AND POPULATION. The total area is 29,541 square kilometers, or 11,371 square miles. The total legal population, according to the census of December 31, 1910, is 7,423,784 (6,693,548 in 1900), an increase of 10.91 for the decade. Of this number, 2,833,334 speak French only, 3,220,662 Flemish, 31,415 German, 871,288 French and Flemish, 74,993 French and German, 8652 Flemish and German, 52,547 all three, 330,893 (including children under two years of age, and foreigners of other nationalities) none of these languages. The males numbered 3,680,790, and the females 3,742,994. The *de facto* population was 7,416,454 (3,677,801 males, 3,738,653 females). Estimated in 1911, 7,490,411. Marriages in 1911 numbered 59,370, births 171,802, deaths 122,843, immigrants 41,062, emigrants 33,007. The population of some of the urban communities December 31, 1911, is as follows: Antwerp 308,618 (with suburbs 407,773), Brussels 176,947 (737,432), Liège 167,676 (243,865), Ghent 166,715 (211,081), Malines 59,191, Bruges 53,484, Ostend 42,638.

EDUCATION. A law is about to be introduced rendering primary education compulsory. Schools are maintained by communal taxation with provincial and state grants. Many additional schools are under ecclesiastical control, Roman Catholic predominating. In 1911 there were 934,830 children and 246,292 adults attending primary, and 275,911 children attending infant schools. There are state and numerous private secondary institutions, and special, technical, and fine arts schools. State universities, Ghent and Liège; free, Brussels and Louvain.

DOMESTIC ANIMALS. These numbered in Belgium, December 31, 1912, as follows: 262,709 horses (261,967 in 1911), 1,880,747 cattle (1,812,191), 1,348,514 swine (1,229,428).

AGRICULTURE. The number of persons engaged in agricultural pursuits in Belgium constantly decreases; in 1864, 24.98 per cent. were so engaged; in 1880, 21.77; in 1895, only 18.79. The type of agriculture practiced is, however, highly intensive. The agricultural area under crops (1895) is 1,916,690 hectares, under forests 521,495, uncultivated 169,329. Of the cultivated area in 1911, there were 744,782 hectares under cereals, 13,575 under legumes, 74,348 under industrial plants, 232,726 under root crops, 386,472 under forage plants, 139,996 under short-season crops sown after removal of main crop. The yield in detail of important crops in 1911 follows: 4,285,238 quintals of wheat, 6,187,858 of rye, 6,277,629 of oats, 967,732 of barley, 385,915 of spelts, 17,715,132 of industrial plants, 15,067,332 of sugar beets, 31,638,805 of forage beets, 27,469,946 of potatoes, 17,934,805 of forage plants (including sown meadows). The area under principal crops and yield, 1912 actual, and 1913 provisional figures, with average quintal per hectare yielded in 1912, are shown in the following table:

	Hectares		Quintals		Qa.
	1912	1913	1912	1913	ha.
Wheat	160,526	159,494	4,177,049	4,093,884	26.0
Rye	263,189	259,491	5,413,697	5,424,898	20.6
Barley	34,121	34,032	925,901	902,630	27.1
Oats	262,191	271,694	5,092,814	6,506,313	19.4
Flax Seed	21,662	23,133	130,553	104,098	6.0
Fibre	4,017	4,023	100,288	96,100	25.0
Tobacco	61,883	52,419	17,303,440	14,250,000	279.6
Sugarbeets					

MINING AND METALS. The abundance of cheap fuel makes practicable an extensive metallurgical industry, for which ores are imported, the output from the home metallic mines having steadily declined since 1880. The table below shows the number of coal mines in operation, area covered (in hectares), production (in metric tons), and value (in thousands of francs) for representative years:

	No.	Ha.	Tons	1000 fr.
1880.....	164	143,837	16,886,698	169,680
1890.....	134	137,661	20,365,960	268,503
1900.....	118	140,286	23,462,817	408,470
1910.....	133	168,717	23,916,560	348,877
1911.....	127	172,069	23,053,540	340,279

The output from steel and iron works, etc., is shown below for two years in metric tons, with the value in thousands of francs:

	M. Tons		1000 fr.	
	1910	1911	1910	1911
Pig iron	1,852,090	2,046,280	120,161	133,664
Mfd. iron*	452,150	421,650	39,494	37,487
Steel	4,500,920	4,974,960	452,460	511,241
Zinc	181,745	198,230	103,541	124,009
Lead	40,715	44,308	13,464	15,572
Silver†	264,655	252,720	27,754	26,689

* Output includes half worked and finished products; the value relates to the finished product only. † From lead.

MANUFACTURES. The manufacturing industries occupy 1,102,244 (1896) persons (1,837,223 men, 265,021 women), and are the chief source of the nation's wealth. Small establishments are in the majority, and house industries are of considerable importance. The textile industry comprehends the manufacture of linen, woollens, and cottons. There were eighty-nine sugar factories in operation in 1911, with an output of 234,764 metric tons; and twenty-one sugar refineries, output 121,226 tons. The output of the glass factories was valued in 1900 at 65,912,000 francs.

COMMERCE. Although the balance of trade in Belgium would be technically classed as adverse, the excess of imports over exports is actually evidence of the country's commercial and financial expansion, in that it represents returns from foreign investment. A table showing general and special commerce for three years follows, with values in thousands of francs:

	1900	1910	1911
Imports (gen.).....	3,594,400	6,551,700	6,806,400
Imports (spec.).....	2,215,800	4,285,000	4,508,500
Exports (gen.).....	3,297,500	5,694,600	5,879,300
Exports (spec.).....	1,922,900	3,407,400	3,580,300

In the next table are given some of the principal exports for home consumption and exports of domestic produce; values in thousands of francs for 1911:

	Imports	1000 fr.	Exports	1000 fr.
Cereals, etc.....	698,200		Woolens	346,700
Wool	382,500		Iron & steel.....	267,100
Hides	182,200		Machinery, etc.....	221,700
Seeds	187,200		Cereals, etc.....	206,600
Cotton	170,500		Hides	161,100
Timber	161,400		Zinc	112,000
Chem. products.....	127,700		Seeds	111,400
Rubber	125,400		Flax	109,400
Iron & steel.....	106,800		Linen thread.....	103,600
Resins, etc.....	104,300		Diamonds †.....	99,000
Diamonds*	98,400		Glassware	87,900
Flax	97,200		Cottons	79,200

* Uncut. † Cut.

Some of the principal countries of origin and destination in the 1911 trade are given below, with values of the imports and exports in millions of francs:

	Imps.	Exps.		Imps.	Exps.

COMMUNICATIONS. Total length of railway lines in operation December 31, 1912, 4719 kilometers (4369 operated by the state). Passengers carried in 1911, 180,840,189 by state, and 18,049,557 by private lines. Fatalities, 164; persons injured, 1131 (of these, 14 killed and 438 injured, were passengers). Telegraph lines (1912), 7975 kilometers; wires, 43,547; stations, 1659; revenue, 6,623,305 francs; expenditure, 5,074,899. Post offices, 1708; receipts, 43,419,097; expenditure, 23,912,335. The merchant marine, December 31, 1912, contained 105 vessels, of 181,637 tons (97 steamers, of 174,021 tons). Vessels entered in the 1911 trade, 11,106, of 15,907,359 tons; cleared, 11,122, of 15,896,915 tons. Merchant marine (1911): 93 steam vessels, of 160,515 tons; sailing, 8, of 5905. Towards the end of the year 1913 a report was presented to parliament by a special commission appointed to consider the question of railway reform in that kingdom, as the state management of the railway lines was almost unanimously considered a failure, resulting in poor service and heavy deficits. The plan proposed by the commission was that the ministry of railways should be replaced by an independent organization to operate and manage the railways on behalf of the state, this organization consisting of a number of directors being supervised by a commission appointed partly by the chamber and partly by the state. It was proposed that the directors, who must be entirely independent of political influence, and not occupying any state office, should be chosen by the king for a period of six years, and be held personally responsible for any irregularity in management. At the same time, practically unlimited powers would be given to such a board. The proposal met with considerable favor in Parliament, as it was deemed desirable to supplant in some way the state operation of the railways. The Belgian railway administration was negotiating with the Dutch state railways regarding the completing of an extension of the line to Sittard, across the German territory.

Increase of traffic on the Belgian railways was indicated by the fact that on January 1, 1900, the number of freight cars was 60,548, and on December 31, 1913, 94,097. It was pro-

posed to construct a new line from Heppen, on the line from Moll to Diest, to a point on the Meuse River, near the Dutch frontier. This would cross the coal fields in the new mining district of Limburg, and as there were to be no level crossings the erection of large bridges over other railways would be a feature of the construction.

FINANCE. The monetary unit is the franc (1 franc=19.3 cents). In the following table ordinary (A) and extraordinary (B) revenue and expenditure are displayed for comparative years:

	1900	1909	1910
Revenue A.....	494,105,773	645,107,015	682,487,132
B.....	48,672,331	150,109,498	132,917,647
Total.....	542,778,104	795,216,513	815,404,779
Expenditure A..	479,055,783	634,450,367	672,954,146
B..	95,102,409	151,747,457	156,502,101
Total.....	574,158,192	786,197,824	829,456,247

* Including loans.

Ordinary revenue (1911), 695,252,000 francs; extraordinary, 1,019,000 (not including loans).

The 1913 budget estimates the ordinary revenue at 757,654,649 francs, including revenue-earning administrations 401,521,250 francs, excise 87,396,500, customs 67,270,650, direct taxes 75,042,000, registration 86,353,000; domains, dividends, interest, etc., 29,274,629; repayments 9,144,124. Expenditure 770,347,437 francs: 356,043,784 francs for railways, 209,371,719 debt charge, 78,041,147 war, 42,373,029 arts and sciences, 49,744,944 marine, posts, and telegraphs, 38,035,607 agriculture and public works, 27,357,500 industry and labor, 31,882,733 justice, 25,312,150 finance, 9,501,800 gendarmerie, 7,901,805 interior, 5,543,050 civil list, 4,990,686 foreign affairs, 2,826,000 repayments, 1,421,483 colonies.

The total consolidated debt was, at end of 1911, 3,734,354,038 francs; floating debt, 201,565,500—total, 3,935,919,538 francs.

GOVERNMENT. Belgium is a constitutional, representative monarchy, hereditary in the male line; and in the event of failure of male issue, the reigning monarch appoints his successor, subject to approval by the chambers. This was the procedure in the case of the late Leopold II. who, dying without male heirs, December 17, 1909, was succeeded by his nephew, Albert Leopold. Heir-apparent, Leopold Philippe, born November 3, 1901. The legislative power rests in the king and a legislative body composed of a senate and a chamber of deputies. A responsible ministry of eight members is appointed by the king. As constituted November 12, 1912, the ministry was as follows: C. de Broqueville, premier and minister of war; H. C. de Viart, justice; J. Davignon, foreign affairs; P. Berruyer, interior; P. Poulet, arts and sciences; M. Levie, finance; G. Helleputte, agriculture and public works; A. Hubert, industry and labor; A. van de Vyvere, railways; P. Segers, marine, posts, and telegraphs; J. Renkein, colonies.

ARMY. The reorganization of the Belgian army was further affected by a law promulgated on June 19, 1913, which substituted new conditions for those established by the law of December 14, 1909. It increased the effective

war strength of the kingdom and, at the same time, changed the conditions of recruitment. The effective strength of the army, which had been fixed at 180,000 men, would be raised so that by 1926 there would be 251,000 men additional available for service, and a war army of 340,000 available men. On a peace footing the new law would give an establishment of 57,886 men, with six army divisions posted at Ghent, Antwerp, Liège, Namur, Mons, and Brussels. With one class of recruits only with the colors, as is usual for the greater period of the year, the effective troops would be as follows: Infantry, 2110 officers, 31,533 men; cavalry, 389 officers, 7661 men; field artillery, 501 officers and 8113 men; garrison artillery, 267 officers and 4050 men; engineers, 187 officers and 2363 men; transport, 119 officers and 643 men. The effective strength of a division would be 6500 men for each of four divisions, and more than 8000 for each of the other two. On a war footing the field army would consist of six divisions and one cavalry division. Four divisions will make a total of 100,000 men, and two divisions, Liège and Namur, of 32,000 men each, will make a total of 64,000, so that including the cavalry division, the total field effective would be 170,000, but these numbers do not include the first line reserve and the militia to make up the losses suffered in war, so that an effective strength of 200,000 was to be reckoned on.

For the rule of one son in a family established by the law of 1909, a system of "generalized service" is substituted, and the annual contingent was fixed at 49 of every 100 enrolled as available, and was raised from 21,000 men, exclusive of 2000 special volunteers, to 33,000 men, also exclusive of 2000 special volunteers. Service is for from fifteen to twenty-one months with the colors in the regular army, according to the arm, and is then followed by eight years on unlimited leave with occasional periods of service and trial. This is followed by five years in the reserve, while all able-bodied men, not otherwise provided for, are enrolled in the Garde Civique, under the minister of the interior in times of peace, and intended chiefly for the maintenance of public order. This force included 45,000 men considered active, and 100,000 men on the rolls as non-active.

M. de Broqueville, minister for war, stated in the Senate late in the year 1913, that in December, 1917, Belgium would be able to place on a war footing an army of 168,331 men, exclusive of officers, and 87,400 reserve and fortress troops.

HISTORY

ELECTORAL REFORM AGITATION. The central feature of Belgian politics in 1913 was the struggle for universal equal suffrage, "one man, one vote." As noted in the preceding **YEAR BOOK**, the system of plural voting was the especial *bête-noir* of the Socialist and Liberal opposition. For twenty years it had been in operation, ever since April 18, 1893, when universal suffrage modified by the plural vote was established, and six times it had been attacked. The law against which these repeated assaults were directed provided that all male citizens over twenty-five years of age should vote; but those who paid a house tax of five francs a year, or owned 2000 francs in real

estate, or enjoyed an income of 100 francs a year from Belgian funds, had two votes each; and those who possessed certificates of higher secondary instruction, or held office, or followed a profession, had three. By means of their plural votes 704,549 men could outvote 993,070 others; for in the last elections 395,866 voters could cast two ballots each, 308,683 could cast three, and 993,070 could cast one each: the two-vote and three-vote men together, although constituting less than 42 per cent. of the electorate, could cast almost 64 per cent. of the total number of votes. The Socialists, being recruited from the one-vote class, could not hope to outvote the upper classes without a reform of the franchise. But in order to amend the electoral law, it would be necessary to revise the constitution, and that would require a two-thirds vote in each chamber of the parliament. The parliament was controlled by an absolute Clerical majority, steadfastly opposed to Socialism and determined not to yield to the demands of Socialists or Liberals. It was patent that equal suffrage must be forced on the parliament, for the parliament would never grant it freely. The necessity of coercing the Clerical majority had been recognized by the *cartel* (coalition) of the Left, after the elections of June 2, 1912, had returned an increased government majority. Before the close of 1912 the opposition had issued the threat, "constitutional revision or the general strike."

When the Socialists proposed to use the general strike as a political weapon, the government, instead of being intimidated, became more than ever insistent on its own authority and on the fact that it controlled a constitutional majority; instead of yielding, it denounced its opponents. The chief of the Liberal group, M. Hymans, attempted to solve the difficult situation by advocating the nomination of an extra-parliamentary commission to look into the matter of constitutional revision, and to see if no better franchise for municipal, provincial, and legislative elections could be found. The idea pleased the Socialists, but gained no sympathy from the staunch conservatives, whose unwillingness to compromise was expressed by M. Woeste; and even before the vote was taken, on February 9, it was clear to all that the motion to consider the revision of the constitution would be lost. Before the vote was taken, M. Vandervelde, the Socialist leader, warned the chamber, "For the seventh time in twenty years you are going to put off the revision of the constitution. To those who asked you to be conciliatory, you reply with 'the reason of state.' The situation is clear. We ask the working class to hear us, to heed the command of its responsible delegates, not to compromise the success of the movement by violence or by a partial strike. Our proposition is going to be rejected now, but it will soon be taken up again." The motion was then voted down by 99 to 83 (two not voting), a clean vote of majority versus opposition, while the Socialist Left cried, *Vive le suffrage universel! Vive la grève générale!*—"Hurrah for universal suffrage!" "Hurrah for the general strike!" Three days later the *Peuple* announced that a general strike would begin on April 14, and a manifesto was issued, appealing to agricultural and industrial workers, merchants, and bourgeois to lend their support to the movement for universal equal suffrage. Despite these loud

and ominous threats of impending trouble, the parliament meanwhile proceeded with the consideration of the army bill.

A last attempt at conciliation was made by the mayors of the nine largest towns. On February 23 they asked the Socialists to renounce the general strike, and promised to plead the cause of revision with the premier, M. de Broqueville. On March 7 thirty delegates of the committee for universal suffrage met the mayors at the *hôtel de ville* of Brussels, and decided that "The national committee, taking into consideration the overtures of the mayors of the large cities, and their declaration that they will make every effort to induce the government to consider the revisionist programme; desirous in a supreme effort of conciliation of permitting the mayors and the ministry freely to seek for a peaceable solution, resolve that: The decree ordaining the general strike to take place on April 14, is revoked." On the following day the cabinet met to discuss the proposals of the mayors. The government, however, was unwilling to concede to the demands made; even to allow a commission to investigate the matter would, if the commission favored revision, bind the government more or less to adopt the commission's recommendations. Nothing could be done, anyway, until after the question had been referred to the people in the next election. After some indecision and misunderstanding, the mayors gave up the attempt at conciliation, and the Socialists, at the Easter congress of the Workingmen's party, March 24, passed an almost unanimous vote in favor of the general strike. Of the 1350 delegates present at the Brussels *Maison du Peuple*, only thirty, including M. Vandervelde, voted in the negative.

THE GENERAL STRIKE. The general strike began on April 14 and lasted eleven days. It had been prepared for months in advance, funds had been accumulated, workers had been notified, and the strike committee had laid plans to feed the strikers and to send the children abroad to sympathetic families in France and Holland. For those who had expected great excitement, the first day of the strike was disappointing. The newspapers appeared as usual, tramways were in operation, many shops were open, and neither riots nor mobs were in evidence. In the days that followed, one newspaper and then another suspended publication, some shops closed their doors, the paralyzation of industry became more apparent, and the strikers in Brussels paraded through the streets. But at no time was there the excitement of mob violence; the strike was a "strike of folded arms." Orderliness and organization were the most striking features of the workmen's demonstration. The men had been told so frequently and so insistently that the strike was to be a strike of folded arms, a sober, serious, peaceable strike, that when the test came, discipline and order prevailed. The strike committee issued manifestos of encouragement and exhortation; savings-certificates were given out; an' common meals were provided for the hungry. As to the extent of the strike, press reports varied. Clericals asserted that less than 300,000 of the million and a half manual laborers were on strike; the strike was not general, they said, since it had not materially affected the transport service, nor made headway among the Flemish Christian

Unionists of the north. The strength of the movement lay in the coal mines and in the factories of the south; in these the strike was practically complete. According to the Socialist journal, the *Peuple*, the number of strikers rose to 400,000 in the first few days. A statement given out by the national committee on April 16, placed the figure at 372,000. The number of strikers was largest in the province of Charleroi, 75,000; Mons, 52,000; Liège, 65,000; Centre, 45,000; Brussels, 21,000; Ghent, 19,000; Verviers, 18,000; Nivelles, 11,000; Huy-Warenne, 10,000; and Braine-Ecaussières, 10,000.

Although the strikes included only a minority of the laboring class, it was general enough to secure consideration from the government. A proposal made by the Radical, M. Lorand, for a sort of referendum on the subject of constitutional revision was discarded in favor of a somewhat ambiguous resolution consenting to the consideration by a commission of the desirability of amending the constitution. It was not a complete victory for the Socialists; indeed it was a compromise rather than a triumph. Nevertheless it satisfied the parliamentary leaders of the workingmen. The leaders, it will be recalled, had been very reluctant to execute their threats of general strike; they had voted in the negative at the Easter congress, and had constantly inclined toward conciliation. So with this partial success they were ready to call off the strike. On April 24 the congress of the Workingmen's party met in the *Maison du Peuple* with 1300 delegates present and M. Fumémont in the chair. The congress adopted by a three-fourths vote a report prepared by MM. Anseele, Destrée, and Vanderveelde, commenting on the extent and effectiveness of the general strike, and concluding, "The national committee of universal suffrage and of the general strike, considering with pleasure the results obtained, urges all citizens to support the foreshadowed reform of universal suffrage as the indispensable condition of national peace; and desires to ask the consent of the congress to the immediate resumption of work." The adoption of this report meant the end of the strike, and work was resumed on April 25 and 26.

The government, in conformity with its promise, appointed a commission to inquire into the desirability of electoral reform; but the inquiry was limited to electoral reform in the communal and provincial elections and did not include parliamentary elections. The commission, appointed in May, seemed unable to accomplish anything, and real electoral reform appeared to be as distant as ever.

THE MILITARY LAW. The consideration of the army bill, interrupted by the general strike, was resumed and continued through the month of May. Various amendments tending to reduce the term of military service to twelve or even to six months, and a provision for regional recruitment (which would allow the creation of separate Flemish and Walloon regiments) were defeated in the Chamber. On May 29 the bill was voted by the lower Chamber by 104 to 63 (3 abstentions), and on June 20 received ratification in the Senate by a vote of 68 to 27. The new law, put into effect December 15, 1913, provided for general compulsory service, instead of service by one son per family as ordered by the law of December 14, 1909. The period of service

with the colors in the infantry was fixed at fifteen months. The annual contingent of recruits was increased from 18,000 to 32,000, the war effectives from 180,000 to 350,000, and the peace footing from 42,800 to 55,000.

By many, this attempt of Belgium to keep pace with the military expansion of larger states was regarded as a piece of costly and senseless jingoism. When asked why Belgium should attempt to compete in military preparation with the larger states of Europe, the president of the council replied, "We do not doubt the sincerity and loyalty of the great nations who are the guarantors of our neutrality. But we have seen by numerous declarations that in case of war Belgium would be called upon again to offer Europe a battlefield. We cannot permit our national dignity to be lowered, nor can we allow our national self-respect to be impaired."

National dignity in this case necessitated the expenditure of 284,000,000 francs. To cover the cost of military reorganization, the finance minister, M. Levie, proposed a loan redeemable in 25 years and a yearly increase of the military budget by 47,000,000 francs. New financial resources had therefore to be created. This was done by a law modifying the registration, mortgage, stamp, and succession taxes. (1) The registration tax. For donations *inter vivos* the tax varies from 1 fr. 40 to 10 fr. 50 on the hundred. Societies doing business in Belgium are liable to a tax of 1000 fr. on a capital of less than 5,000,000 fr., 2000 fr. on 5,000,000 to 10,000,000, 4000 fr. on 10,000,000 to 20,000,000, 10,000,000 fr. on 20,000,000 to 50,000,000, and 20,000 fr. on capital greater than 50,000,000 francs. A graduated tax is established on leases. (2) Operations on the bourse are henceforth subject to a tax of 15 centimes on 1000 francs, i.e., .015 per cent. (3) Stamp tax. A stamp tax was imposed on insurance policies, and on foreign securities, as well as on many legal documents. (4) Inheritance tax. The succession duty was fixed at 6 per cent. for husband or wife; 7½ per cent. for brothers and sisters; 9 per cent. for uncles, aunts, and adopted children; and 15 per cent. for unrelated persons. It may be noted that the chambers of commerce of Brussels, Ghent, and Liège protested vigorously against the new laws.

SPECIAL SESSION OF PARLIAMENT. Owing to the protracted discussions of the constitutional revision, military, and financial bills, it was necessary to call a special session of parliament in October, in order that the ministry might take up the budget and the remainder of its programme of social legislation, compulsory school attendance, and technical education. On December 23 the Chamber passed a miners' pension bill, granting a pension of \$70 a year to all miners over 55 years of age who have worked underground for forty years; the expense to be met by state and provincial governments. The subject of education, always a delicate question in Belgium, was again brought to the fore by the government's proposals to compel children between the ages of six and fourteen to attend school, to require that all instructors must be Belgian citizens and possess diplomas, and to equalize the subsidies paid to communal and to "free" (Catholic) schools.

THE GHENT EXPOSITION. The international exposition of Ghent was opened on April 26 by the king and queen, and was largely attended.

BENNETT CUP. See AERONAUTICS.

BENZOL (BENZENE). This substance was found by several reliable observers to be a valuable drug in the treatment of leukemia, a disease which has hitherto been resistant to all forms of therapy, although the X-rays have had a favorable effect in many cases. Leukemia is a disease of the blood-forming tissues (spleen, bone-marrow, and lymphatic glands), resulting in an enormous increase of white blood cells and a reduction in the number of red corpuscles, and is usually fatal. Von Koranyi first used benzol in 1912, with excellent results, in chronic cases of leukemia. He states that there were no failures and he also found that the administration of benzol was not incomparable with X-ray therapy, but had rather better effects in patients who had previously been exposed to the X-ray. These results have been confirmed by many other clinicians. Owing probably to the fact that there are several types of leukemia, involving, in different degrees of severity, the spleen, bone-marrow, and lymphatic system, the action of benzol is not uniformly beneficial in reducing the number of leukocytes, but hemoglobin and red corpuscles are usually increased. Benzol being a dangerous poison in large doses, it must be given with caution and in small amounts, 3 to 5 gm. per day being the average dose.

BEREA COLLEGE. An institution for higher education, founded at Berea, Ky., in 1845. In addition to the college department, there was a normal school, an academy, and several vocational schools. The students in all departments in 1913 numbered 1736. There were seventy-three members of the faculty. The productive funds amount to about \$1,000,000, and the annual income to about \$165,000. The library contains 27,000 volumes. The president is William G. Frost, Ph.D., D.D.

BERGSON, HENRI. See PHILOSOPHY.

BERIBERI. Caspari and Moszkowski added an interesting chapter to the study of this disease. It seems conclusively proven that beriberi in man is the result of a diet closely restricted to polished rice or other food which lacks the antineuritic substance. Caspari and Moszkowski, who had been studying the subject for years, believed their investigations showed that beriberi is not the result of a deficiency in the diet, but of some toxic addition, and that it is essentially an intoxication. Their metabolic findings show great destructions of albumin, which could not be otherwise explained. One series of experiments which led to this conclusion was as follows: Pigeons were fed for several months on hens' eggs with the addition of a small amount of sugar and salt. On this diet the birds remained in excellent health. To the diet of some of the pigeons was added some polished rice. Each bird so fed developed polyneuritis in a longer or shorter time, while those remaining on egg diet remained healthy. This seems to demonstrate that it is a toxic addition and not a deprivation which is responsible for the affection. But the toxic substance is not necessarily in the food, but may originate in the body under the influence of a polished rice diet. See also PLAGUE.

BERLIN. See ARCHITECTURE.

BERMUDA. A British colony, composed of about 300 small islands lying some 500 miles east of Cape Hatteras, having an area of 19 square miles and a population in 1911 of 6691 white and 12,303 colored. Capital, Hamilton (2627 inhabitants). Originally a maritime people, the population in recent years has engaged almost entirely in the cultivation of early vegetables for export to the New York market. Nearly all provisions consumed in the islands are imported. Many tourists visit the islands during the winter season, which is mild and salubrious. School attendance is compulsory for children of primary school age, but all schools are private and charge fees. Imports and exports for the year 1911 were valued at \$545,540 and £134,033 respectively (£517,074 and £106,508 in 1910). Revenue and expenditure (1911), £79,248 and £90,100 (£78,593 and £68,392 in 1910). Customs revenue, £63,707. Public debt, £45,500. Governor (1913), Lieut-Gen. Sir George M. Bullock.

BERRY, JAMES HENDERSON. Former United States senator from Arkansas, died January 30, 1913. Born in Jackson County, Alabama, in 1841, he removed in 1848, with his parents, to Arkansas. In 1861 he joined the 16th Arkansas Infantry (C. S. A.) as second-lieutenant. He lost a leg at the battle of Corinth in 1862. At the close of the war he studied law; in 1866 was admitted to the bar; and was twice elected to the State house of representatives—in 1866, and in 1874. In the latter year he was speaker. He was president of the Democratic State convention in 1876; two years later he became judge of the Circuit Court of the State; was elected governor of Arkansas in 1882; and in 1885 United States senator to fill the unexpired term of A. H. Garland. He was reelected in 1889, 1895, and 1901, but was defeated in 1907.

BETAFITE. See MINEROLOGY.

BEZJIAN, H. ALEXAN. A Turkish scholar and educator, died February 10, 1913. He was born in Turkey in 1838. His early training was received at Bebek Seminary, under Dr. Cyrus Hamblin. He studied at Yale University, where he took the degree of Ph. D. in 1874. With the exception of time spent in the United States and a year spent in France and England, he taught almost continuously at Aintab, Turkey, and the neighboring city of Marash for fifty-six years. For thirty-seven years he was the senior member of the faculty of Central Turkey College. He wrote much for the newspapers, and, besides books on natural religion, a *Guide to the Study of the English Language*, and *Elements of Physics*. He was one of the most distinguished scientific men that Turkey has yet produced.

BIBLE SOCIETY, AMERICAN. An organization for the encouragement of a wider circulation of the Holy Scriptures, founded in 1816. During the year ending June 30, 1913, the work of the society continued to expand. The aggregate issues for the year were 4,049,610 volumes. This aggregate included 399,734 Bibles, 713,891 New Testaments, and 2,935,985 portions of the Bible or New Testament. This was an increase of 358,409 volumes over the issues of 1912, and more than twice those reported in 1907. Of this aggregate, 2,107,159 volumes were issued from the Bible House in New York and 1,941,751 volumes from the society's agents abroad. The total issues of the society

in its ninety-seven years of existence amounts to 98,268,715 volumes.

An important department of the society's work is the translation of the Scriptures into foreign languages. During 1912, arrangements were made for the continuance of the translation of the Scriptures into the language of the Navaho Indians by missionaries of the board of home missions of the Presbyterian Church. The revision of the Zulu Bible, which had been carried through by missionaries of the American board in South Africa, is nearing its completion. The process of transliterating the Kurdish New Testament is making steady progress. Other additions of the Bible which are being revised are the Siamese, Chinese and the Spanish version of the New Testament. The home agencies of the society include work among the colored people in the South, the Northwestern agency, the South Atlantic agency, the Western agency, Pacific agency, Southwestern agency, the Eastern agency, and the Atlantic agency. Foreign agencies are found in nearly all the countries of the world. In addition to its work by means of agencies, the society is in correspondence with a number of missions through which it distributes Scriptures in some parts of Europe, Asia, and Africa. The total appropriation made during the year for home agencies was \$138,600, for foreign agencies \$317,800, for special purposes \$40,000, for the manufacture and purchase of Scriptures \$250,000, for miscellaneous expenditures, \$67,000, or a total of \$813,400. The endowment funds of the society amount to \$2,385,290 and the annuity funds to \$281,961, or a total of invested funds of \$2,594,252. The president of the society is James Wood, the recording secretary, Henry O. Dwight, LL. D., and the treasurer, William Foulke.

BIBLE SOCIETY, BRITISH AND FOREIGN. Founded in 1804, the sole and simple aim of this richly endowed society is to promote the widest possible circulation of the Holy Scriptures—always in the King James version, or in the revised English version of 1881-1885—a circulation which in the course of a single year has achieved a grand total of close upon 6,000,000 copies. Up to 1913, the society had issued close upon 200,000,000 copies. Excluding the United Kingdom, it had agencies or secretaries in 27 of the chief cities of the world. In England and Wales alone there were 5800 auxiliaries, branches, and associations.

BICYCLING. See CYCLING.

BILLIARDS. Amateurs occupied the lime-light in billiard circles in 1913, their playing being of such a high character that the National Association of American Billiard Players plans to raise the qualifying average for the Class A championships from seven to eight. The grand average for international tournaments will be placed at ten. The international championships in 1913 were held at Paris and were won by Albert Morier of France. J. F. Poggenburg was the United States representative. In the national Class A championship tournament held at Philadelphia, Joseph Mayer was the victor, winning six matches and losing none. Mayer made a high run of 130. His high average was 22 4-18. Charles F. Conklin finished second in the tournament with five victories and one defeat. The Class B amateur title went to H. A. Coleman, and the Class C

title was won for the second successive year by C. B. Terry.

In professional billiards, W. F. Hoppe successfully defended his 18.2 balk line championship three times, the matches all being played in the Hotel Astor, New York. In the first contest, Hoppe defeated George Sutton by 500 to 301. In the second, Hoppe defeated Koji Yamada by 500 to 33, and, in the third, Hoppe defeated Calvin Demarest by 500 to 211.

Alfredo De Oro lost the pocket billiards title to Benjamin Allen, the score being 515 to 600. Allen also defeated Charles Weston, challenger for the title, by 600 to 411. De Oro successfully defended his three-cushion carom championship by defeating J. B. Hogan, 150 to 120, and J. W. Carney, 150 to 143. The three-cushion game continued to increase in popularity, and a tournament has been arranged for the early part of 1914.

BISBEE, MARVIN DAVIS. An American educator and librarian, died August 30, 1913. Born in Chester, Vt., in 1845, and graduated from Dartmouth College in 1871, he studied at the Andover Theological Seminary, and in 1873 was ordained to the Congregational ministry, later filling pastorates at Fishville, N. H., and Cambridge, Mass., until 1881. In that year he became associate editor of the *Congregationalist*, serving until 1886, when he was appointed professor of divinity and librarian at Dartmouth College. In 1883 he became professor of bibliography and librarian at that college. He served in this position until 1910, when he retired on the Carnegie Fund. From 1910 until the time of his death, he was director of extension courses at the Chicago Theological Seminary. He was a member of several learned societies.

BLAKE, LILLIE DEVEREUX. An American lecturer and advocate of woman suffrage, died December 30, 1913. She was born in Raleigh, S. C., in 1833. Her father died while she was two years of age, and her mother removed with her to New Haven. Her first attempt to obtain equal rights for women was a demand for admittance to Yale University. This was denied her. In 1855 she married G. Q. Umstead (died in 1859), and in 1866 to Gaenfill Blake, a New York merchant. In 1870 she openly advocated the cause of women suffrage on lines laid down by Elizabeth Cady Stanton. Her first fame as a lecturer was won by her replies to a series of lectures on women by the Rev. Dr. Morgan Dix, rector of Trinity Church. These lectures, later published in book form as *Woman's Place To-day*, became a handbook on woman suffrage. For eleven years she was president of the New York State Woman Suffrage Association. In 1900 she founded and became president of the National Legislative League. She worked for legislation in favor of women in many States, and was instrumental in bringing

about many reforms in the treatment of women in various forms of employment. She was the author of *Southwold* (1859); *Rockford* (1862); *Fettered for Life* (1872); *Woman's Place Today* (1883); and *A Daring Experiment* (1898).

BOILERS. Improvements in boilers and boiler room practice during the year 1913 were characterized by attempts at increased efficiency and economy rather than radical innovations. In most large plants increased attention was being paid to various measuring, indicating, and analyzing devices for the more intelligent control of the operation of the boilers and, at the same time, greater training supervision of the firemen, was being practiced, the aim being, of course, to secure the most economical combustion of the fuel and the greatest amount of heat received by the water with a minimum loss by stack gases and other waste. Without specifying any particular devices the general tendency was toward securing more automatic control of boiler plants so that the human element would be eliminated, yet, at the same time, more attention than ever was being paid to this important consideration. Just as mechanical stokers had been successfully developed for solid fuel, so mechanical atomizers for oil fuel were arousing the attention of engineers, especially with the more extensive use of such fuel. While a mechanical atomizer that operates without the loss of equivalent energy is desired, it must be one working more advantageously than the present systems of steam and compressed air.

The record of the Detroit Edison Company for boilers of large output and square feet of surface was to be maintained in the new Connors Creek station on Belle Isle. At the Delray station the units in use were rated at 2350 boiler horse power on a basis of 10 square feet of heating surface, and with this installation it was found possible for a single unit to carry a load of 11,000 kilowatts. In the new installation as planned the same general type of unit, with equal heating surface, was to be used, but certain modifications of the furnace were arranged so that by forcing one boiler could carry continuously the enormous load of 13,300 kilowatts.

In the United States, the usual number of boiler accidents and explosions were noted during the year, and a tabulation for the first six months totalled 234, in which 68 persons were killed and 234 were injured. In addition, during this period there were three economizer explosions in which 6 were killed, and 20 injured. The statistics on this subject are compiled annually by the Hartford Steam Boiler Inspection and Insurance Company, which includes under the term of boiler explosions, steam pipe ruptures, air and elevator tank explosions, breaks in the cylinder head, etc. In 1912 there were 537 such accidents, in which 278 persons were killed and 392 injured. Such a list of fatalities naturally led to an agitation for more stringent State license boiler inspection laws, intelligently enforced. In 1913 progress in this direction was indicated by an engineers' license law for California, a boiler

inspection law for Indiana, revised laws for Montana, a license law for New Jersey, and new boiler regulations for the province of Ontario. The National Association for Stationary Engineers had a national license committee at work in this field and the National Association of Tubular Boiler Manufacturers had adopted standard boiler statistics, which were considered further in the direction of safety.

BOKHARA. A Russian vassal state in central Asia, covering about 83,000 square miles; population, about 1,500,000. Capital, Bokhara.

BOLIVIA. An interior republic of South America. The seat of government, executive and legislative, is La Paz; the supreme court sits at Sucre.

AREA, POPULATION, ETC. The estimated area is 1,379,014 square kilometers (532,437 square miles), or, including disputed territory, 1,458,034 square kilometers (562,047 square miles). The delimitation of the Argentine boundary was in progress during 1913. The 1900 census returned 1,744,568 inhabitants, of whom 50.9 per cent. were Indian, 26.7 mestizo, 12.7 white, 0.21 negro, and 9.4 unclassified. The estimated population in 1912 was 2,450,000. The larger towns include La Paz, with about 95,000 inhabitants; Cochabamba, 29,000; Potosí, 25,000; Oruro, 24,000; Sucre, 23,500; Santa Cruz, 21,500; and Tarija, 8000. In 1912 there were 990 elementary schools, with 3960 teachers and 81,336 pupils. For secondary instruction, 21 colleges, 5 clerical institutions, and 5 private lyceums are reported, with total of 180 teachers and 2177 pupils. Higher instruction is available at 19 institutions, with 78 professors and about 800 students. The state religion is Roman Catholicism, to which almost the entire population is at least nominally adherent.

PRODUCTION AND COMMERCE. The great elevated plateau of western and central Bolivia contains the larger part of the population, both urban and rural. Mining is the leading industry. The area under cultivation is estimated at over 4,900,000 acres, producing corn, rice, barley, beans, potatoes, etc., but these crops are of little commercial importance. In the north, rubber is produced in considerable quantities. In output of tin ore Bolivia ranks next after the Federated Malay States. The other important mining products are silver, bismuth, copper, and gold. Livestock as reported for 1910: Cattle, 734,535; horses, 96,867; mules, 44,635; asses, 174,090; sheep, 1,454,729; goats, 473,370; swine, 114,147; llamas, 428,209; alpacas, 112,033.

Imports and exports have been as follows, in thousands of bolivianos:

	1907	1908	1909	1910	1911	1912
Imports..	34,562	33,069	36,937	48,802	58,371	49,609
Exports..	45,902	58,924	63,764	74,567	82,631	90,123

The leading exports in 1912 were: Tin, 60,238,196 bolivianos (52,639,603 in 1911); rubber, 15,508,721 (18,921,192); silver, 4,308,329; copper, 2,150,042; sealed gold, 1,297,375; bismuth, 2,106,000; coca, 726,000; hides, 276. In 1911, the United Kingdom was credited with imports 12,470,000 bolivianos and exports 59,582,000; Germany, 10,311,000 and 10,993,000; Belgium, 4,064,000 and 3,760,000; France, 2,832,000 and 6,751,000; Chile, 9,837,000 and 411,000; the United States, 9,865,000 and 627,000.

COMMUNICATIONS. The length of railway open to traffic in 1913 was reported at 1284 kilometers; under construction, 633 kilometers. Bolivia has undertaken a considerable railway extension, and in addition to the lines under construction, 2899 kilometers have been planned. The line from the port of Arica to Alto de La Paz has been completed, and opened under the auspices of the governments of Chile and Bolivia. Telegraphs in 1912: Lines, 6133 kilometers; wire, 8951; offices, 194. Post offices, about 200.

During the year the Corocoro Railway, a branch of the Arica to La Paz line, extending to the mining centre of this name, was opened for traffic. Construction was under way on the line from Portugalete to Jupiza and from Oruro to Cochabamba.

FINANCE. The law of September 14, 1908, made gold the standard of value and fixed a rate of 12.5 bolivianos silver as equivalent to a pound sterling, that is, par value of the boliviano, 38.932 cents. The provisions of this law have not been fully carried out as the congress failed to provide the means to make it practical; Bolivian gold is not yet in circulation, and only the British sovereign and the Peruvian libra are legal tender to an unlimited amount.

The estimated revenue and expenditure for 1912 were 17,237,100 and 17,356,552 bolivianos respectively. The actual revenue was reported at 20,164,602 bolivianos. The 1913 budget showed estimated revenue 22,073,500 bolivianos, and estimated expenditure 25,258,450. The estimated receipts were: Import duties, 10,387,000 bolivianos; export duties, 4,971,500; imports, 2,444,500; other, 4,270,500. The larger avenues of expenditure: Ministry of commerce and finance, 8,406,435 bolivianos; war and colonization, 5,070,629; interior and fomento, 4,055,045. The public debt in 1913 stood as follows: Foreign, £473,600 (loan of 1908), £1,491,750 (loan of 1910), and £1,000,000 (loan of 1913); internal, 5,487,610 bolivianos; floating, 5,542,283 bolivianos.

GOVERNMENT. The president, who, with two vice-presidents, is elected for four years, is assisted by a cabinet of six ministers. The legislative power is vested in a bicameral congress elected by direct vote; the Senate has 16 members elected for six years, and the Chamber of Deputies 75 members elected for four years. The president for the term beginning August 14, 1909, was Eliodoro Villazón. His successor was Ismael Montes, who was inaugurated August 14, 1913. First vice-president, J. M. Saracho, who had been second vice-president in the Villazón administration; second vice-president, José Carrasco.

ARMY. An army of about 300 officers and 4000 men on a peace basis is maintained which, in time of war, can be augmented to about 85,000 men. National service is obligatory from the 21st to the 40th years, consisting of five years with the active army, two of which are spent with the colors, five years in the first ban of the national guard, and ten years in the second ban of the national guard. The troops, which have been trained from time to time by French and German officers, comprise seven battalions of four companies each of infantry, one battalion of three companies of machine gun troops, two regiments of four squadrons each of cavalry, one division of two batteries each of four pieces of field artillery, one regiment of mountain artillery of two divisions

of two four-gun batteries each, a system of mobilization whereby the country is divided into sections where groups of from 40 to 100 men are more or less developed.

HISTORY

THE NEW PRESIDENT. In the presidential elections of May 1 the only candidate for the presidency was Señor Ismael Montes, former minister to Paris. Señores Saracho and Carrasco were elected vice-presidents. The retiring president, Señor Eliodoro Villazón, made his farewell speech to Congress on August 5, dwelling with especial emphasis on the necessity for railway communications with Buenos Aires, for the achievement of which he had negotiated a loan of \$5,000,000 with the *Crédit Mobile* of Paris, and had arranged with the Argentine Republic for the construction of a railway from Quiaca to Tupiza. The president-elect, General Montes, assumed office a few days later and appointed the following ministers: Sr. Cupertino Arteaga, foreign relations; Sr. Claudio Pinilla, interior; Sr. Casto Rojas, finance; Sr. Plácido Sánchez, justice; Sr. Carlos Calvo, education; Sr. Nestor Gutiérrez, war.

THE CONGRESS. On October 23, the Chamber of Deputies passed a new banking law. There was also under consideration a new law prohibiting the importation of alcohol after January 1, 1917. Numerous applications were received for permission to exploit the salt mines of the west. After almost a month of heated debate the Chamber of Deputies passed a bill in December giving to the national bank the exclusive right to issue paper money.

MISTREATMENT OF ABORIGINES. It was reported in October that conditions in the northern part of Bolivia among the natives employed by *concessionaries* to collect wild rubber were as scandalous as those unearthed in the course of the recent Putumayo investigation. The governments of Great Britain and the United States were said to be investigating the matter. In December it was stated that the Aborigines Protection Society would not at present publish its charges relative to the cruel treatment of Bolivian natives, the delay being ascribed to diplomatic pressure. For further details, see PERU.

FOREIGN AFFAIRS. The government was actively engaged in an attempt to reach an understanding with the neighboring state of Chile. Bolivia, as is well known, is extremely anxious to obtain an outlet on the Pacific, either from Chile or from Peru; and in pursuance of this ambition General Montes proposed, in the spring of 1913, that Chile should cede the Pacific port of Arica to Bolivia, for compensation. This was not arranged, however, but by means of the La Paz to Arica railway, Bolivian industry was given access to the Pacific Ocean, and the Chilean government, by way of concession, declared Arica a free port. Another valuable concession was obtained by Bolivia: the suspension of all storage charges at the Chilean port of Antofagasta for goods in transit to Bolivia. On May 3 a protocol was signed by representatives of Chile and Bolivia in accordance with article 13 of the treaty of peace and amity of 1904, whereby the term of 15 years for the transfer of the Bolivian section of the La Paz to Arica railway by the government of Chile to Bolivia should be counted from May 3, 1913.

On October 28, Vice-President Carrasco paid a visit to Chile.

BOLL-WEEVIL. See COTTON.

BOOTS AND SHOES. The boot and shoe industry during the year 1913 was fairly prosperous, as customers seemed willing to pay the rising prices required by the advancing cost of leather of all kinds. Massachusetts continued to maintain its preëminence as the boot and shoe manufacturing State and statistics published during the year in a census of manufactures showed that the production of boots and shoes, exclusive of cut stock and findings, had increased from \$196,898,074, in 1911, to \$209,489,037, in 1913, a gain of \$12,590,963, or 6.4 per cent. Lynn had replaced Brockton as the leading boot and shoe manufacturing centre in the United States, having gained in the year 12.2 per cent., while Brockton had lost. Haverhill, also, had gained 11 per cent. in its output. The average earnings in these cities where the shoe industry flourished were considerably higher than in other cities, being for Brockton \$639, Lynn \$632, and Haverhill \$612. In regard to 1913, unofficial estimates for the boot and shoe production of Lynn placed its value at between \$37,000,000 and \$38,000,000, as compared with \$35,500,000 in 1912 and \$33,500,000 in 1911. Brockton also showed an important increase in 1913, as indicated by estimates from its leading newspapers. There were shipped during the year 678,966 cases, a gain for the year of 20,651 cases over 1912, and the total value of the products for the year was \$51,841,819, or a gain of \$4,000,000 over 1912. The number of pairs in the shipments were 18,190,042, an increase of 1,215,892 pairs over 1912. The prosperity of Brockton was further interesting, as the boot and shoe industry there was thoroughly organized, and labor union workers in 1913 numbered 12,520, as against 11,620 in 1912. In Haverhill the output for 1913 was 596,495 cases, an increase of 24,540 over 1912. This was the largest yearly production in the history of the city, standing for an average shipment of 11,471 cases, with a maximum shipment of 15,931 cases during the week of January 2, 1913.

PURE SHOE LEGISLATION. The boot and shoe industry, like other lines of manufacture in the United States, was much concerned during 1913 with "pure fabric," or, more specifically, "pure shoe" legislation. At the end of 1913 it was stated that "pure shoe" laws had already been adopted by some 25 different States throughout the Union and that eight distinct measures of the same general nature were pending in Congress. The general tendency of these statutes, or bills, was that shoes not made entirely of leather should be stamped "adulterated," or, "substitute leather." There were many different points of view to be considered in connection with such legislation. For example, it was claimed that where fibre counters—the stiffening inserted above the heel of a shoe—were employed in 24 million pairs of shoes with a guarantee that the retail price of the shoes would be refunded if the counter did not outwear the shoes, only one pair in each 143,000 was returned on account of the poor wearing qualities, a better record than was secured with all leather counters. Furthermore, it was said that there were not sufficient hides in the country to supply material for all leather shoes and that this deficiency amounted to at

least two million hides, not to mention the increasing cost of leather. The shoe dealers also claimed that the price of hides and leather was artificially stimulated by the interests and control of the packing houses, and meat industry, and they asserted that they were in part responsible for the "pure shoe" law agitated. It was further claimed that the retail price of shoes would rise to at least \$10 per pair if such legislation was enforced, and while shoe dealers had no objection to the proper branding of shoes as "all leather," or "pure leather," and to laws against misrepresentation in advertising, yet they claimed that to brand the ordinary shoes of commerce that were furnishing satisfactory wear as "adulterated" or "substitute leather" was unfair to them and against public interest. See LEATHER.

BOSTON OPERA COMPANY. See MUSIC.

BOSTON PORT IMPROVEMENT. See DOCKS AND HARBORS.

BOSTON SYMPHONY ORCHESTRA. See MUSIC.

BOSTON UNIVERSITY. An institution of higher education, founded under the auspices of the Methodist Episcopal Church in Boston, in 1869. The total number of students enrolled in the several departments of the university in the autumn of 1913 was as follows: Law school, 359; medical school, 117; theological school, 238; college of liberal arts, 758. The faculty numbered about 70. There were no noteworthy changes in the faculty during the year, and no noteworthy benefactions were received. The library contains about 10,000 volumes, but in addition, the university has the privilege of utilizing the facilities of the Boston Public Library.

BOTANY. NECROLOGY. Among the botanists of note to die during the year were Lester F. Ward, long with the United States National Museum, Dr. A. Fischer, formerly professor of botany at Basel, and Robert Lindsey, curator of the botanic garden at Edinburgh, Scotland. Alfred Russell Wallace, who shares with Darwin the theory of natural selection, died November 7, 1913, aged 91 years. Dr. T. J. Burrill, noted as having discovered the cause of pear blight, the first demonstrated bacterial disease of plants, retired from active duty, and Dr. William Trelease, formerly director of the Missouri Botanical Gardens, succeeded him at the University of Illinois. Dr. L. Radkofer, professor of botany at the University of Munich, has also retired.

The *Journal of Ecology* was established in England to foster the study of ecology, the first number appearing in March, 1913, and *La Revue de Phytopathologie* began publication in April.

LEGISLATION. The principal legislation relating to botanical matters was an amendment to the plant quarantine act of August 20, 1912, by which the United States Department of Agriculture is permitted to secure material for investigation. Canada, Scotland, and England have adopted measures to aid shippers in securing the admission of plants and their products into the United States. In Pennsylvania the legislature made an appropriation of \$100,000

to continue the active measures for the control of the chestnut blight, but the bill was vetoed on the acknowledged ground of its utter insufficiency. The Congress appropriated \$80,000 for continuing a study, by the United States Department of Agriculture, of the disease and its control. Australia and South Africa have taken additional measures to prevent the introduction of plant diseases, and Tobago and Trinidad have adopted restrictive ordinances.

PLANT BREEDING. Great activity in plant breeding characterized the year 1913, many new forms being described and additional data given regarding the origin and character of others. Lancaster reported a bigeneric hybrid between *Zephyranthes* and *Cooperia*. Brown made a histological study of a number of hybrids and found that dominance in histological characters followed dominance in external characters. Von Tschermak gave additional data regarding the theory of factors as explaining phases of inheritance in stocks, peas, and beans. Stuart and Batchelor working independently with carnations found the commercial forms are heterozygous and when single and double forms are crossed segregations follow as would be expected under the Mendelian law.

Edith Saunders found sap color in stocks due to two factors, the absence of either resulting in white. Keeble stated that gigantism in *Primula* is due to three factors and fluctuating variations are due to the heterozygous state of one or more factors. Heribert-Nilsson claimed that *Enothera lamarckiana* is a hybrid, and Davis seemed to confirm this belief. Gates found that some of the characters in the gigas group of *Enothera* behave in a Mendelian ratio after they have arisen, but their appearance cannot be explained in this way.

Fruwirth brought together in a volume data regarding progress in plant breeding with a number of tropical and subtropical crops. Emerson and East reported on the inheritance of a number of characters in maize. Collins believed there is imperfect segregation in maize and selection is required to establish a full expression of their characters. East and Hayes gave an account of their experiments with maize and tobacco. Setchel and Goodspeed described a large number of *Nicotiana* hybrids, and Gabrielle Howard claimed that inheritance in tobacco can be explained by the Mendelian assumption of segregations. Passerini reported a mutant arising in a pure bred variety of wheat, and mutants of wild species of *Solanum* were produced by Heckel, Planchon, and Schikorra that are similar to certain cultivated varieties of *Solanum tuberosum*.

STUDIES OF SOIL ORGANISMS. Löhnis gave a comprehensive review of the progress in agricultural bacteriology to 1912. Brown claimed the vertical distribution of soil organisms is limited by aeration and toxic substances produced during plant growth. Sharp found living bacteria in soils that had been kept closely stoppered in the laboratory for 25 to 33 years. McBeth showed the addition of small quantities of nitrogen often hastened nitrogen fixation. Hoffmann confirmed McBeth and Kellerman that nitrogen fixation is increased by the addition of carbohydrates to soil, the carbohydrates supplying energy. Lipman claimed nitrogen fixing organisms behave physiologically like alkali-resisting plants. Migula claimed that soil bacteria

in forests check their own activity by developing acid from decaying leaves. Hutchinson found that bacteria in Indian soils may reduce nitrates without anaerobic conditions. Bottomley showed that *Azotobacter* and *Pseudomonas* growing together fix more nitrogen than both grown separately, and Lyons claimed the same mutualism for cereal and leguminous crops.

PLANT PHYSIOLOGY. Stäger found that bright warm weather induced the formation of protandrous flowers in *Geranium robertianum*, protogynous ones in cool damp weather. Shantz found artificial shading had a greater effect on plant growth than temperature and moisture variation. Maximum growth occurred below the maximum of full illumination. Müntz claimed that assimilation was limited more by carbon dioxide supply than intensity of sunlight. A number of investigators found injurious effects due to radium emanations, ultraviolet light, X-rays, etc., when the exposures were too strong or of long duration. Radioactive waters stimulate germination and growth.

Experiments with electricity on plants showed that direct currents are less beneficial than alternating ones. Stone found electric discharges of high potential into the atmosphere stimulating to plant growth. Priestley and Vozáry reported increased crop production due to the same cause. Some interesting temperature relations were shown. Macfarlane found plant protoplasm shows a temperature adaptation from 200° to 100° C. Louguinine found the temperature of plants increases from the ground upward until an equilibrium is established. Buds have the highest temperatures of any parts of the plant. Freezing was found correlated with the density of cell sap and solutions of various salts were found to give protection against moderate degrees of cold.

Osterhout believes the plasma membrane of plant cells is proteid and that anaesthetics decrease its permeability. Ruhland claimed that the movement of colloids indicates a protoplasmic regulation of permeability. Leclerc du Sablon claimed anything that will cause contraction will reduce permeability, and Dachnowski showed that the injury due to bog water is in proportion to the amount of absorption. Dumont showed that permeable membranes may become semi-permeable through the absorption of salts and remain so until the concentration within the cell is lowered.

Briggs and Shantz elaborated a method of determining the water requirements of plants and found the amount of water required by various crops. Kearney found the presence of alkali increases the water requirements of plants. Cole demonstrated a method for the direct measurement of water movement in leaves. Seeliger found the maximum of transpiration takes place in half-grown leaves. Lloyd claimed a relationship between stomatal opening and water loss by cotton plants and that the stomata are closed at night, open in the morning, and again close about 11 o'clock. Livingston found leaves have a greater water withholding power at certain times of the day than at others. Ewart was unable to determine from experiments with trees whether water lifting power was due solely to the leaves or whether it was supplemented by other agencies. Renner claimed roots exert a passive relation to water

absorption and that water movement is due to transpiration, negative pressure, and lowering of turgor in root cells. Leclerc du Sablon found increased transpiration in sunlight is due to increased permeability of cells and not chlorophyll activity.

Herlitzka claimed chlorophyll in living leaves exists in a colloidal state. Plester found in some species of plants that assimilation was greater than their green color would suggest. Light colored leaves were lower in respiration and assimilation, and red below green in both. Palladin claimed respiratory chromogens have an important function in respiration through their ability to absorb oxygen. Bokorny found that most toxic substances are stimulating to plants in low concentrations. Stoklassa synthesized carbohydrates through the influence of ultraviolet rays, and Moore and Webster synthesized aldehyde from colloidal uranium and iron hydroxids in sunlight. Angelico and Catalano found undoubted evidence of formaldehyde in the sap of leaves. Molliard claimed chlorophyll plays a rôle in synthesizing proteids. Palladin and others found ammonia a transformation product in plants. Prianišnikov found amids were synthesized from ammonia by a number of species of plants.

A number of investigators reported hydrocyanic acid in plants and Pêche suggested it has its origin in connection with the chlorophyll of the palisade parenchyma. Growth was found to depend upon turgescence, and investigations showed the law of the minimum applies to the growth activities of most plants. Montemartini claimed phosphorus plays an important part in reproductive processes and nutrition, and nitrogen in vegetative development. Mameli claims manganese essential in chlorophyll formation. Gile found concentration of solutions more important in the lime-magnesia ratio of plants than their balancing. Osawa claimed seedlessness in citrus fruits is generally due to lack of fertile pollen grains and not to the absence of normal embryo sacs.

PLANT DISEASES. Investigations of a number of nonparasitic causes of plant injuries were reported upon. Gatin gave additional evidence of the injury to plants by the ring roads. Crowther and Steuart found the injurious effect of city smoke could be detected to a distance of seven miles. Bokorny thought the injury attributed to tobacco smoke was due to the ammonia formed, while Crocker and Knight considered it was caused by carbon monoxide and ethylene gas. Averna Saccà claimed chlorosis of grapes, coffee, and other plants in Brazil is due to a lack of magnesium and not too much lime. Allard obtained evidence which he believed indicated the mosaic disease of tobacco was due to a living organism, but Chapman claimed it was due to a disturbance in the oxidases.

The rust problem continued to be of interest, and Arthur, Kern, Deitel, Frazer, and others reported upon heteræous forms, while Johnson described a number of unattached forms in the United States. Magnus described a number of geographic or biological races of *Puccinia graminis*. A disease of wheat and rye known as the foot disease, due to several species of fungi, among them *Ophiobolus graminis*, gave serious trouble in Europe. The timothy rust, only recently considered of

economic importance in the United States, was reported as spreading rapidly. The theory of Bolley that diminished yields of grain are in a great measure due to soil fungi received corroborative evidence in investigations conducted in Europe. The presence of rust pustules on grain was said by Eriksson to be of little significance in spreading infection, but Beauverie in France found the presence of the rust on the seed highly important. Attacks of *Helminthosporium* on grain were known for some time, and at least three species were said to attack barley in Wisconsin.

The chestnut blight, which threatened the destruction of chestnut trees, is known to occur from Merrimack County, N. H., to Albemarle County, Va., and westward to Livingston County, N. Y., Warren County, Pa., and Randolph County, W. Va. The active control measures begun in Pennsylvania were abandoned owing to a lack of sufficient funds. The United States Department of Agriculture continued studies into the nature of the disease and means for its control. The fungus is now known as *Endothia parasitica*, and what is apparently the same fungus was recently reported from China, indicating the oriental origin of the disease. The white pine blister blight (*Peridermium pini*), continued to be of interest, and its Cronatium form on the currant has been reported from Massachusetts, Connecticut, and New York.

Potato diseases were troublesome in Europe, America, and Australia. The leaf roll, leaf curl, and black wart diseases gave most concern in Europe, especially in Germany and England, while the late blight became quite destructive in Australia. The leaf roll disease, the silver scurf (*Sponylocadium atrovirens*) and the powdery scab due to *Spongospora subterranea* were all reported as having been introduced from Europe into the United States. Two dry rots were described by Wilcox and Woollenweber as due to species of *Fusarium*, but they are believed to be the same.

A large number of contributions to knowledge of diseases of fruit trees were made during the year. The fire or bacterial blight of pears and apples due to *Bacillus amylovorus*, in addition to pome fruits, is known to attack plums, and it was reported as present in England and Italy. The American gooseberry mildew (*Sphaerotheca mors-uvæ*) proved very destructive in Europe, causing greater loss than in this country. Recent investigations of Shear, Taubenhaus, and others showed that the ripe or bitter rots of many fruits attributed to many species of *Glomerella* could be reduced to a very few distinct forms. The brown rot fungus of peaches, plums, etc., attributed in this country to *Sclerotinia fructigena*, was proved identical with *S. cinerea* of Europe.

THE CONTROL OF PLANT DISEASES. Most of the experiments reported were in testing the efficiency of Bordeaux mixture, lime-sulphur, and some new fungicides. A number of investigators reported some injury to apples following spraying with Bordeaux mixture or lime-sulphur solution. Spraying with milk of lime soon after Bordeaux mixture will reduce injury due to that cause. At the Illinois Experiment Station, Bordeaux mixture was found the best general fungicide for the control of apple diseases. Lime-sulphur with lead arsenate gave excellent results in the control of apple scab. Brooks reported

similar results. For the control of peach diseases lime-sulphur gave uniformly good results.

Vermorel and Dantony claimed that the adhesiveness of Bordeaux mixture and other copper fungicides can be largely increased by the addition of gelatin to acid solutions and of casein to alkaline ones; where casein is not available skimmed milk may be substituted. Ewert reported that Bordeaux mixture exerts a protective as well as a fungicidal influence during periods of drought and strong sunshine. For some reason the use of Bordeaux mixture did not prove economically profitable in Australia for the control of potato diseases during dry seasons. For the control of smut diseases of cereals, soaking for 4 to 6 hours in cool water followed by 10 to 15 minutes in hot water 42 to 50° C. gave complete immunity to disease and there was no loss in vitality of the seed grain.

See also CARNEGIE INSTITUTION OF WASHINGTON, *Department of Botanical Research*.

BIBLIOGRAPHY. Among the large number of botanical books which appeared during the year were, notably: W. Bateson, *Problems of Genetics*; J. C. Bose, *Researches on Irritability of Plants*; N. L. Britton, and A. Brown, *Illustrated Flora of Northern United States, Canada, etc.* (revised and enlarged edition); W. F. Bruck, *Plant Diseases*, translated by J. R. Ainsworth-Davis; H. DeVries *Gruppenweise Artbildung*; A. Engler, and E. Gilg, *Syllabus der Pflanzenfamilien*; H. Fittig, H. Scheneck, L. Jost, and G. Karsten, *Lehrbuch der Botanik für Hochschulen*; K. Goebel, *Organographie der Pflanzen*; W. F. Ganong, *The Living Plant*; P. Haas, and T. G. Hill, *Chemistry of Plant Products*; E. W. D. Holway, *North American Uredineæ*; H. Klebahn, *Grundzüge der allgemeinen Phytopathologie*; A. Legault, *Maladies cryptogamiques des Plantes Agricoles*; F. W. Neger, *Biologie der Pflanzen*; J. K. Small, *Flora of Southeastern United States*, revised; F. L. Sargent, *Plants and Their Uses*; P. Sorauer, *Handbuch der Pflanzenkrankheiten*, third edition; F. L. Stevens, *The Fungi which caused Plant Diseases*; E. Strasburger, *Das Botanische Prakticum*, fifth edition.

A considerable number of nature study, secondary school, and agriculture books of botanical interest have been published, among them: G. F. Atkinson, *Botany for High Schools*; E. Bourcart, *Insecticides, Fungicides, and Weedkillers*; B. C. Buffum and D. C. Deaver, *Sixty Lessons in Agriculture*; J. Burt-Davy, *Maize, its History, Cultivation, and Uses*; J. G. Coulter, *Plant Life and Plant Uses*; A. E. Knight, and E. Step, *Popular Botany*; D. D. Mayne, and K. L. Hatch, *High School Agriculture*; Julia E. Rogers, *The Book of Useful Plants*; E. J. Russell, *Soil Conditions and Plant Growth*; C. M. Weed, *Seeing Nature First*; W. P. Wright, *The New Gardening*.

BOUCICAULT, AUBREY. An American actor, died July 10, 1913. He was born in London in 1869, the son of Dion Boucicault. He received his education at the City of London School and at Eton College. In 1887 he removed to the United States, where in the same year he began his professional career in *The Two Orphans* with Kate Claxton. He then returned to London, where he played parts in several theatres. On returning to the United States again, he for some time supported Richard

Mansfield. He first attracted general attention in Oscar Wilde's play *A Woman of No Importance*. Among other plays in which he took a prominent part were *My Friend from India*, *The Ragged Regiment*, *Mistress Nell*, and *The Lily*. He also revived the most famous of the plays written by his father. Three years before his death he acted only occasionally on account of ill health.

BOWDOIN COLLEGE. An institution for higher education at Brunswick, Me., founded in 1794. In the autumn of 1912, there were 422 students enrolled in the college, and the faculty numbered 86. The college includes the Medical School of Maine. Professor Henry L. Chapman, LL.D., professor of English literature and for many years senior professor of the college, died in 1913. The productive funds at the end of the college year 1912-13, amounted to \$2,210,503, and the income for the year 1912-13 to \$153,151. There were in the library 105,389 volumes. The president is William De Witt Hyde, S.T.D.

BOWLING. Two new records were made in 1913. The Flor de Knispel bowlers of St. Paul scored a total of 3006 pins for three games in the American Bowling Congress tournament at Toledo, and W. J. Knox of Philadelphia at the same tournament rolled a perfect score of 300, a feat never before accomplished. The results of the 13th annual A. B. C. tournament follow: Individual championship won by Earnest Peterson of Columbus, Ohio, with a total of 1693; two-men team championship won by the Schultz-Koster combination of Newark, N. J., with a score of 1291; five-men team championship won by the Flor de Knispels of St. Paul with a total of 3006 pins; all-round championship won by George Herman of Cleveland with a score of 1972 and an average of 209.1. The seventh annual tournament of the National Bowling Association was held at Rochester. The winners and scores were: Individual, George Kumpf of Buffalo, 712; two-men team, Smith-Riddell of New York, 1259; five-men team, Bronx Centrals of New York, 2938; all-round, James Smith of Brooklyn, 1928, and an average of 214.2.

BOWMAN, EDWARD MORRIS. An American musician and composer, died August 27, 1913. Born in Barnard, Vt., in 1848, he graduated from St. Lawrence University in 1866. He studied music under D. William Mason in New York, the piano under Franz Bendel in Berlin, and the organ under Alexander Guilment in Paris and Sir Frederick Bridge in London. In 1866-7 he was organist at Trinity Church in New York, in the latter year leaving that position to become a teacher and conductor of music in St. Louis, where he remained for 20 years, after which he was appointed organist and director of music at the Peddie Memorial Church in Newark, N. J. From 1891-5 he was professor and director of music in Vassar College. He was the founder and director of the Temple choir and the Temple orchestra of 200 members. In May, 1906, he became director of the Calvary Baptist choir in New York City. He was a member of many musical associations and societies, and was the author of *Bowman's Weitzmann's Manual of Musical Theology* (1876), and *Master Lessons in Piano Playing* (1911). He also contributed to musical journals

BOWMAN, GUY. See **SOCIALISM, Great Britain.**

BOXING. In striking contrast to the year 1912, when eight titles changed hands, no new champions appeared in the boxing arena in 1913. The list of champions therefore remains the same and includes: Jack Johnson, heavyweight; Willie Ritchie, lightweight; Johnny Kilbane, featherweight; Johnny Coulon, bantamweight. The middleweight and welterweight titles are still open. Jack Johnson took part in only one bout in 1913, that with "Jim" Johnson in France. The heavyweight champion broke his arm early in the contest, and had to be content with a draw. The French Federation of Boxing made an unsuccessful appeal during the year to the State Athletic Commission of New York to have Johnson's title taken from him. The white heavyweight standing out most prominently at present is "Gunboat" Smith, who in 1913 defeated Sam Langford and other aspirants for the championship. Georges Carpentier won the heavyweight championship of Europe by defeating Bombardier Wells, the English title holder in one round.

Boxing in New York State was put on a much sounder basis, although fewer bouts were held during the year. The receipts of the State commission were \$45,000, or about \$10,000 less than in 1912, and 116 licenses were issued.

The championships of the A. A. U. were held at Boston, May 7. The results of the final bouts were: 108-pound class, Barney Snyder of Boston defeated Leo Kahn of New York; 115-pound class, T. L. Keagan of Boston defeated E. K. Orthe of New York; 125-pound class, W. Hitchen of Toronto defeated W. Ridge of Brockton; 135-pound class, M. J. Crowley of Malden defeated Mike Sullivan of Boston; 145-pound class, Charles Askins of Boston defeated T. J. Barrett of St. Johns, N. B.; 158-pound class W. Barrett of New York defeated B. A. Lavelle of Boston; heavyweight class, A. J. Reich of New York defeated W. F. May of the U. S. navy by default; 175-pound class, Joe Brown of Pawtucket defeated Nap Boutillier of Boston.

The winners of the Canadian championships were: 105-pound class, Williams of Toronto; 115-pound class, Pacy of Toronto; 125-pound class, Hitchens of Toronto; 135-pound class, Jackson of Toronto; 145-pound class, Harris of Toronto; 158-pound class, J. Smith of Toronto; heavyweight class, W. L. Smith of Buffalo. The English amateur champions are: G. R. Baker, featherweight; A. Wye, bantamweight; F. Grace, lightweight; W. Bradly, middleweight; R. Smith, heavyweight.

BOYCOTT. DANBURY HATTERS' CASE. This famous case grew out of a strike by union hatters employed by D. E. Loewe & Company of Danbury, Conn., July, 1902. The following year the company brought suit against Martin Lawler and 239 other members of the United Hatters of North America for maintaining a boycott in violation of the Sherman anti-trust law. The defense was taken up by the American Federation of Labor (q.v.), while the prosecution was supported by the Anti-Boycott Society of America. In 1908 the Supreme Court handed down a verdict of interpretation, in which it was maintained that the acts charged constituted a violation of the Sherman law. Late in 1909 in the United States District Court at Hartford, a jury rendered a verdict for the plaintiff of \$74,000. Treble damages were

awarded in accordance with the Sherman law. This verdict was set aside by the Court of Appeals; but in a new trial the jury late in 1912 rendered a verdict for the plaintiff of \$80,000 and cost, this sum being trebled. The case was then taken to the United States Circuit Court of Appeals, which on December 18 affirmed the judgment of the lower court. The plaintiff was awarded total damages of \$272,000. In its opinion the court said:—"That the anti-trust act is applicable to such combinations as are alleged in the complaint is no longer debatable. The law makes no distinction between the classes, employers or employees, corporations or individuals. Rich and poor alike are included under its term. The Supreme Court particularly points out that, although Congress was frequently importuned to exempt farmers' organizations and labor unions from its provisions, these efforts all failed and the act still remains. No one disputes the proposition that labor unions are lawful. All must admit that they are not only lawful but highly beneficial when legally and fairly conducted, but, like all other combinations irrespective of their objects and purposes, they must obey the law."

BOY SCOUTS OF AMERICA. An organization founded in 1908, for the general purpose of training boys between the ages of 12 and 18 in self-reliance, manhood, and good citizenship. The movement has shown great increase since its foundation. In February, 1913, commissions were granted to 935 assistant scout-masters, 3479 scout-masters, and 231 scout commissioners, making a total of 4645 commissions for the year, as compared with a total of 4360 for the previous year. Charters were granted to 188 local councils. It is estimated that in 1913, there were nearly 14,000 men more or less actively interested in the movement as members of the local councils, and committees in different parts of the country. The total membership of the society is estimated at about 300,000. The Boy Scouts were brought into public eye in 1913 as a result of their efficient service on the field of Gettysburg, where they assisted veterans assembled there and performed other services. They have also rendered valuable service in bringing about a safe and sound 4th of July. In several States plans have been formulated whereby the Boy Scouts are actively coöperating in the efforts of State authorities to protect forests from fire and disease. These States include New Hampshire, Pennsylvania, North Dakota, Massachusetts, Michigan, and others. Organizations of the Boy Scouts have been formed in Hawaii, Porto Rico, and in the Philippine Islands. The honorary president is Woodrow Wilson, honorary vice-presidents William H. Taft, and Theodore Roosevelt, president Colin H. Livingstone, chief scout Earnest Thompson Seton, national scout commissioner Daniel Carter Beard, treasurer George D. Pratt, chief scout executive James E. West.

An organization called the American Boy Scouts was started in 1910 by W. R. Hearst as a military movement. Mr. Hearst later gave up the work and the name was changed to the United States Boy Scouts. It is located chiefly to New York City.

BRADY, ANTHONY NICHOLAS. An American capitalist, died July, 1913. He was of Irish descent, but born at Lille, France, 1843. Shortly after his birth, his parents came to the United States and settled in Troy, N. Y. At an early

age he was obliged to provide for himself, and found work in Albany as cashier in a hotel, studying in his scant leisure. In 1864 he opened a tea store in Albany, and his experiment was so successful that he soon opened other stores until he had a chain of them in Albany, Troy, and other neighboring cities. In the meantime he was attracted to the business of paving and building contracting; went to work at it; made contracts with the city for paving the sewers; and was very successful. His work for the city drew his attention to the question of lighting, and he studied the water-gas process. To carry out his plans in this connection, large capital was necessary, and he interested Roswell P. Flower, afterwards governor of New York, and Edward Murphy, later United States senator for New York. With them and with E. C. Benedict he formed a syndicate which purchased the Albany gas plants and became one of the most successful corporations of its kind in the country. His next step was the acquisition of the gas companies in Troy, and of the control of all the gas companies in Chicago and certain other cities. A successful venture in the oil business in Ohio followed. Electricity as a motive power for street railways then absorbed him, and he and his friends took over the horse-car lines in Albany and Troy and turned them into trolley lines. He then came to New York City and got control of the Bronx trolley lines and the Brooklyn Rapid Transit Company; and he consolidated the New York city surface car lines and made similar consolidations in Washington, Philadelphia, and other cities. He was a director, trustee, or officer in over a hundred important corporations; an art collector, whose collections included many important pictures; and a collector of books.

BRADY, JAMES H. United States senator (Republican) from Idaho. He was born in Pennsylvania, in 1862, and when a child removed with his parents to Kansas. He was educated in the public schools and in the Leavenworth Normal College, and for three years he taught school, afterwards editing a newspaper for two years. In 1895 he removed to Idaho, where he became largely interested in the development of irrigation and in farming. He was nominated by acclamation for governor of the State and elected in 1908. He is president of the Trans-Mississippi Commercial Congress. In 1913 he was elected to the Senate to fill the unexpired term of the late Senator Heyburn. His term of office expires March 3, 1915.

BRANDEIS, LOUIS DEMBITZ (1856—). An American lawyer and publicist, born at Louisville, Ky. He was educated in Louisville, at Dresden, Germany, and in law, at Harvard. Though successful in the practice of his profession, he became more widely known through his interest in economic, social, and political problems. He was one of the earliest advocates of the adoption of a radical policy of conservation by the government, supporting Gifford Pinchot (q.v.) in the latter's attack on R. A. Ballinger (q.v.), and acting as counsel for Luther R. Glavis in the Ballinger-Pinchot investigation. In 1910 he appeared for the shippers in the hearing held before the Interstate Commerce Commission relative to an increase in the freight rates asked for by the railroads. He was also counsel (for the people) during the proceedings involving the constitutionality of

the Oregon and Illinois ten-hour laws for women, and in the New York garment-workers' strike of 1910 he was chairman of the arbitration board. The various inquiries and investigations into the New York, New Haven & Hartford Railroad in 1912-13 brought from him a vigorous denunciation of the road's administration. He is author of many articles on public franchises, wage-earners' life insurance, and other economic subjects, and of contributions to legal reviews.

BRANNER, JOHN CASPER. An American geologist and educator; in 1913 elected president of Leland Stanford Junior University. He was born in New Market, Tenn., in 1850, and graduated from Cornell University with the degree of B. S. in 1874. He took graduate studies at Indiana University in 1885, receiving the degree of Ph. D. From 1875-77 he was a geologist of the Imperial Geological Commission of Brazil, and in the year following, was engineer and interpreter for a mining company in that country. He was special botanist of the United States Department of Agriculture in South America in 1880-81, and in 1882-83 was agent for this department. From 1883-85 he was topographic geologist for the geological survey of Pennsylvania. In the latter year he was appointed professor of geology at Indiana University, serving until 1892. For the greater part of this period, he was also State geologist of Arkansas. He was appointed professor of geology at Leland Stanford Jr. University in 1892, and in 1898-99 was acting president. From the last-named year until his election as president he was vice-president of this university. In 1899 he was director of the Branner-Agassiz expedition to Brazil. Following the earthquake in California in 1896, he was a member of the California Earthquake Commission. He was special assistant to the geological survey in Brazil in 1907-08, and in 1911 was director of the scientific expedition of that country. He was an associate editor of the *Journal of Geology* and the author of many publications relating to Brazil, geology, and physical geography.

BRAZIL, UNITED STATES OF. A federal republic of South America. The capital is Rio de Janeiro.

AREA AND POPULATION. The area of Brazil, not known with accuracy, is estimated at 8,550,000 square kilometers (3,301,155 square miles). The estimated population in 1912 was 24,000,000; another estimate placed it at 25,000,000. These figures include Acre territory (acquired from Bolivia in 1902), whose estimated area is 191,000 square kilometers (73,745 square miles) and population about 70,000. The census of 1900 returned 17,318,556 inhabitants, and that of 1890, 14,333,915. The census to be taken in 1910 was omitted on account of lack of funds. In January, 1913, Rio de Janeiro had 975,782 inhabitants. In 1912 the population of São Paulo was estimated at 400,000; Bahia, 350,000; Belem de Pará, 100,000; Porto Alegre, 100,000; Curitiba, 60,000. Much uncertainty exists as to municipal populations; the following figures may indicate approximately the relative size of important cities: Recife (Pernambuco), 150,000; Manaus, 80,000; Fortaleza (Ceará), 50,000; Niteroy, 50,000; Santos, 50,000.

Immigrants in 1912 numbered 180,182. In 1907 the number of immigrants was 67,787; 1908, 94,695; 1909, 85,410; 1911, 135,967. The

immigrants of 1912, of whom 124,612 were agriculturists, included 76,530 Portuguese, 35,492 Spaniards, 31,785 Italians, 9193 Russians, 7302 Syrians, etc., 5733 Germans, 3045 Austro-Hungarians, 2909 Japanese, 1513 French, and 1077 British.

EDUCATION. The greater part of the population is illiterate, but in recent years primary instruction has made considerable progress. In his annual message of 1913 the president stated that the government was giving great attention to education and was establishing many schools equipped in modern style. In 1910 there were 12,221 primary schools, with 634,539 pupils (352,418 boys and 282,121 girls). Of the schools, 2608 were municipal, 6918 government, and 2695 private. Secondary schools in 1909 numbered 327, with 30,258 pupils. There is no university in Brazil, but various institutions offer some opportunity for technical and professional instruction.

PRODUCTION. Vast areas of Brazil are unsettled and some even unexplored. In the settled districts agriculture is the principal source of wealth. Coffee is the leading crop, grown chiefly in the state of São Paulo, but also in the states of Rio de Janeiro and Espírito Santo and to some extent in Minas Geraes. Rubber, gathered in the Amazon valley, ranks next to coffee in export value. In 1913 there appeared to be some reason to suspect that rubber collection in various Brazilian districts is carried on under conditions analogous to those which obtained in the Putumayo region of Peru, where murder, mutilation, and other atrocities were, and perhaps continue to be, perpetrated on the natives. Brazil is one of the chief sources of the world's supply of cacao, which is produced almost wholly in Bahia; this state leads also in the production of tobacco. Other important crops are sugar, produced especially in Pernambuco, cotton, rice, corn, yerba maté, and bananas. Stock-raising is fostered by the government, and large numbers of cattle are raised in parts of Matto Grosso, Minas Geraes, São Paulo, and Rio de Janeiro. Many districts of the republic are rich in minerals, but mining is not widely developed. There is some production of gold, manganese, gems, and monazite sand.

The leading manufacture is cotton cloth. In 1910 there were 194 cotton mills; spindles numbered 761,816 and looms 27,958; the consumption of cotton was 34,607 metric tons. In June, 1912, the number of industrial establishments in the country was 3664, with a capital of 727,719,771 milreis (paper), an annual output of 811,798,008 milreis, and 168,764 employees. The values of certain Brazilian manufactures are reported as follows for 1911: Cottons, 139,567,000 milreis; woolens, 11,375,000; sugar, 74,045,000; dried meat, 38,800,000; boots and shoes, 32,066; beer, 24,602,000; sackings, 22,390,000; tobacco, 21,763,000; matches, 21,475,000; hats, 17,384,000; tanned leather, 15,861,000; lard, 13,545,000; wooden furniture, 12,010,000; earthenware, etc., 10,906,000.

COMMERCE. In the special trade imports and exports of merchandise are stated as follows, in thousands of pounds sterling:

	1903	1907	1909	1910	1911	1912
Imports..	24,208	40,528	37,139	47,872	52,822	63,425
Exports..	36,883	54,177	63,724	63,092	66,839	74,649

The leading imports include iron and steel manufactures, machinery, railway materials, cotton goods, flour, coal, wine, arms and ammunition, codfish, kerosene, jerked beef, and paper. The weight in metric tons, and the value in thousands of pounds sterling, are as follows for the principal exports:

	1000 £ 1910	1000 kgs. 1911	1000 £ 1912
Coffee	26,696	675,468	724,818
Rubber	24,646	36,547	42,286
Hides	1,736	21,832	36,255
Maté	1,959	61,834	62,880
Tobacco	1,607	18,489	24,706
Cacao	1,383	34,994	30,468
Cotton	893	14,647	16,774
Poultry (raw)...	692	2,798	3,189
Sugar	679	35,208	4,727

Coffee export, in metric tons, prior to 1911: 1903, 775,634; 1904, 601,472; 1905, 649,230; 1906, 837,949; 1907, 940,840; 1908, 759,507; 1909, 1,012,842; 1910, 583,524.

The special trade by countries is reported as follows, in thousands of pounds sterling:

	Imports		Exports	
	1911	1912	1911	1912
United Kingdom.....	15,344	15,970	10,040	8,863
Germany	8,870	10,909	9,703	10,685
United States.....	7,045	9,899	23,810	29,201

Total, including other	52,822	63,425	66,839	74,649

In 1912 the percentage of imports from the United Kingdom was 25.2, and of exports thereto 11.9; Germany, 17.2 and 14.3; United States, 15.6 and 39.1; France, 9.0 and 9.8; Argentina, 7.5 and 3.9; Belgium, 5.4 and 2.7; Portugal, 4.7 and 0.2; Italy, 3.9 and 1.1; Uruguay, 2.5 and 1.1; Austria-Hungary, 1.4 and 5.0; Netherlands, 0.7 and 6.3.

In 1910 there entered at the ports 5509 foreign vessels, of 13,591,515 tons (of which 4638, of 12,243,862 tons, steam), and 16,834 Brazilian vessels, of 7,813,659 tons (of which 10,544, of 6,647,349 tons, steam); total, 22,343 vessels, of 21,405,174 tons (of which 15,182, of 18,891,211 tons, steam). The merchant marine in 1911 consisted of 238 steamers, of 130,582 tons net, and 290 sail, of 60,728 tons net.

COMMUNICATIONS. On December 31, 1911, the total length of railway in operation was 22,287 kilometers. During 1912, 787 kilometers were opened to traffic, making the total at the end of the year 23,074 kilometers (14,337 miles). It is of interest to note that the extension of Brazilian railways increased from 9973 kilometers in 1890 to 12,967 in 1895, 15,316 in 1900, 16,780 in 1905, 21,446 in 1910, 22,287 in 1911, and 23,047 in 1912. The following table, relating to the end of 1911, shows in kilometers (1) lines belonging to and managed by the federal government, (2) lines belonging to the federal government and farmed, (3) lines conceded by the federal government with guarantee of interest, (4) lines conceded by the federal government without guarantee

of interest, and (5) lines belonging to the states of Para, Pernambuco, Bahia, Rio de Janeiro, São Paulo, Paraná, Santa Catharina, Rio Grande de Sul, and Minas Geraes; *a* indicates lines in operation, *b* lines under construction, and *c* lines for which studies had been approved.

	(1)	(2)	(3)	(4)	(5)
a.....	3,343	7,462	3,146	1,783	6,391
b.....	438	2,482	255	198	684
c.....	435	2,281	837	1,259	259

In 1912 the Madeira-Mamoré railway was completed the total length being 364 kiloemters. This line is of great commercial importance to Mato Grosso, Acre territory, and Bolivia.

FINANCE. The value of the gold milreis is 54.6 cents, of the paper milreis about 32 cents, fluctuating between 31.5 cents and 33.5 cents. The budget submitted to the congress for 1913 showed estimated revenue of 125,792,000 milreis gold and 345,243,000 milreis paper; estimated expenditures, 80,861,000 gold and 431,374,000 paper. For 1912 the revenue was reported at 137,096,000 milreis gold and 381,694,000 milreis paper; for 1911, 122,903,000 gold and 354,419,000 paper. Public debt, December 31, 1912: Foreign, £81,477,520 and 299,032,000 francs; internal, 685,289,600 milreis paper. The floating debt at the end of 1911 amounted to 256,546,647 milreis paper. Paper money in circulation at the end of 1912, 607,025,625 milreis. At this same date convertible notes in circulation amounted to 396,415,230 milreis paper. In 1912 the interest on the foreign debt was £4,178,292; on the internal debt, 33,640,609 milreis paper.

NAVY. In 1913 the navy included: Two modern battleships (*São Paulo* and *Minas Geraes*), aggregating 38,500 tons; two armored coast guards, 6320; two scout cruisers (*Rio Grande* and *Bahia*), 6200; one protected cruiser (*Barroso*), 3450; one old battleship (*Riachuelo*), 5700; two second-class cruisers, 5840; three torpedo cruisers, 3090; ten modern destroyers, 6500. In addition there were two school ships, river gunboats, dispatch boats, old torpedo craft, etc. Of the foregoing vessels, the two modern battleships, the two scout cruisers, and the ten destroyers were built in pursuance of the naval programme of 1907. The programme was to be completed with a third battleship, the *Rio de Janeiro*, which was launched at Elswick, January 22, 1913. She has a displacement of 27,500 tons and carries fourteen 12-inch guns. There was considerable delay in her construction, owing to changes in design; and she appears to have been finally unsatisfactory, as in the autumn of 1913 the government announced that the battleship did not harmonize with the fleet and would be sold. The principal characteristics of the *São Paulo* and *Minas Geraes* are: Designed speed, 21 knots; displacement, 19,250 tons; length between perpendiculars, 500 feet; beam, 95.5 feet; draft, 25 feet; battery, twelve 12-inch and twenty-two 4.7-inch guns; maximum thickness of armor belt, 9 inches.

ARMY. The Brazilian army, as organized, is based on compulsory service between the ages of 21 and 44, and consists of an active army with its reserve, in which the recruit spends nine years. The permanent army is

composed mainly of volunteers and any deficiency is made good by lot. A reserve is maintained which each year undergoes a period of training of four weeks. There is also a reserve of the second line to which men are called for training for various periods, and a national guard and its reserve. On a peace basis the actual strength of the permanent army is about 18,000 men, while on a war basis the strength is estimated at about 500,000, although the full effect of the legislation governing the army was uncertain. The law fixing the total strength for 1913 put the figure for the rank and file at 31,825, distributed among the units on a minimum establishment basis. This law also gave authority to call out reservists for manoeuvres up to the number of 20,000. The active forces include fifteen regiments of infantry of three battalions each, twelve battalions of chasseurs, five companies of three sections of three pieces each of machine gun troops, and twelve sections each with three pieces. The cavalry consists of nine regiments of the line divided into four squadrons, three regiments of independent cavalry divided into four squadrons, five regiments of brigade divided into two squadrons each, and five platoons. The artillery includes five regiments of field artillery, formed of three divisions of three four-gun batteries, five six-gun batteries of howitzers, three divisions of horse artillery, divided into three four-gun batteries each, three groups of mountain artillery each of three four-gun batteries, nine battalions of fortress artillery, of which three have six batteries each and six two batteries each, six batteries of independent fortress artillery, five parks and fifteen columns of ammunition. The engineers consist of five battalions, each of four companies, and there are five squadrons of the train. The Brazilian army is divided into troops of occupation and independent troops, there being for each group a separate organization. The territorial divisions on which the organization is based are as follows: I. Amazonas. II. Grão-Pará. III. Maranhão et Piauí. IV. Ceará et Rio-Grande-do-Norte. V. Paraíba et Pernambuco. VI. Alagoas et Sergipe. VII. Bahia et Espírito-Santo. VIII. Minas Geraes. IX. Rio de-Janeiro. X. São-Paulo et Govaz. XI. Paraná et Santa Catharina. XII. Rio-Grande-do-Sul. XIII. Mato Grosso.

GOVERNMENT. The federal Congress consists of the Senate and the Chamber of Deputies. Senators, 63 in number, are elected by direct vote for nine years, three for each state and the federal district. There are 212 deputies, elected for three years. The president is elected for four years by direct vote and is not eligible for the succeeding term. He is assisted by a cabinet of seven ministers appointed by and responsible to himself. The president in 1913 was Marshal Hermes da Fonseca, elected March 2 and inaugurated November 15, 1910; vice-president, Wenceslao Braz Pereira Gomes; minister for foreign affairs, Lauro Severiano Muller.

HISTORY

PRESIDENTIAL MESSAGE. On May 5 President Hermes da Fonseca delivered a message to the federal Congress reviewing the recent work of his government in the establishment of well-equipped schools, the support of demonstration farms, the inspection of cattle, the pro-

motion of agriculture, the fostering of the rubber industry, and the protection of Indians. In his opinion it was exceedingly important to complete the work of Baron Rio Branco in the further demarcation of the frontiers of French and Dutch Guiana. He congratulated himself on the satisfactory solution of the coffee valorization question, and expressed a desire to reach an agreement with Italy about the subsidized steamship lines.

THE RUBBER INDUSTRY. Great concern was felt about the rubber industry, the second largest export industry of the country. Owing partly to the competition of cheap "plantation rubber" from the far East, the rubber market was glutted and a crisis ensued. The federal government responded to the emergency by enacting measures designed to facilitate the transportation and stimulate the production of Brazilian rubber. On June 5 an important agreement was made between the federal minister of agriculture, the state of Para, and the rubber defense committee, for the reduction of the tax burdens on the industry. The state of Para agreed to reduce the export tax on rubber 10 per cent, annually for five years, and to invest 5 per cent. of the income from the rubber tax on the improvement of the means of transportation. The transportation and navigation companies, conciliated by promises of a larger volume of business, granted large reductions in their rates. In return, the federal government contracted to create an experiment station and rubber-refinery at Belem, Para, to build railways into the interior, to encourage industry and agriculture in the state of Para, and to build an immigrants' hotel for the encouragement of immigration to Para.

The government took further occasion for the exposition of its plans for the development of industry in a natural rubber exposition, opened at Rio de Janeiro on October 12.

MISCELLANEOUS. Sr. Belfort Viera was succeeded as secretary of the navy by Sr. Alexandrino Alençar; it was reported that the new head of the marine department would sell the dreadnought *Rio de Janeiro*, then in process of construction by a British firm.—The new minister of finance, Sr. Rivadavia de Cunha Correa, prepared a budget in which expenditures of 93,385 milreis gold, plus 433,253 milreis paper, were more than balanced by estimated revenues of 132,584 milreis gold and 372,046 milreis paper. It was strongly recommended by the president that of the total revenue, about a million and a quarter, gold, should be set aside to purchase the equipment of the Amazon Wireless Telegraph and Telephone Company (American) in accord with the policy of government ownership of telegraph lines.—The secretary of education submitted to Congress a plan for the establishment of libraries in the capitals of all the states. A national congress of instruction was opened at Bahia, on July 4. At that same city, by the way, extensive harbor facilities had just been created. On February 1, the minister of agriculture concluded with the society for trade, industry, and agriculture a contract which provided for the importation and settlement of 10,000 European immigrant families.—According to a decision of the federal courts, the government was to turn over the imperial crown of the former monarchy to the present representative of the house of Braganza.

THE COMING ELECTIONS. Before the close of the year the various political groups began to prepare for the general elections, which will take place on March 1, 1914. The Republican-Conservatives put forward Sr. Wenceslao Braz for president, and Sr. Urbano dos Santos for vice-president. The Liberals, who at present form the opposition minority, nominated Sr. Ruy Barbosa for president, and Sr. Alfredo Ellis for vice-president.

FOREIGN RELATIONS. Relations between the United States and Brazil were somewhat strained as a result of the action filed by the Taft administration against the Brazilian valorization committee as the result of a controversy regarding the coffee trade. During the dispute 932,000 bags of coffee were held in New York. The most serious consequences of the misunderstanding was the suspension on April 9 of the preferential tariff on American products. The loss to American exporters can be appreciated when one recalls that the preference shown to American goods had amounted to thirty per cent. of the customs duty on flour, and twenty per cent. on typewriters, cement, corsets, clocks, watches, etc. During the brief period of suspension the loss to American manufacturers amounted to about \$250,000 on flour alone. The valorization suit was speedily dismissed by the United States, and in the hope of establishing more friendly relations, the Secretary of State invited the Brazilian minister of foreign affairs to visit Washington. Brazil responded by restoring the preferential tariff and sent Dr. Lauro S. Müller to repay the friendly visit made by Hon. Elihu Root in 1906. For more than a month, from June 10 to July 16, Dr. Müller attended banquets and baseball games, luncheons, and receptions. At a banquet on July 10 Mr. Bryan eloquently commented on the significance of the visit and said, "I am sure this visit has convinced our guest of the genuine good will the American people feel toward his country, and all that concerns that nation. I want to tell the president and the people of Brazil that we are attached to that country by all the closest bonds of friendship, and I believe Dr. Müller's visit will be fruitful in future visits, fruitful in commerce, and fruitful in the splendid friendships that bind these two republics together." The government of Brazil was no less courteous. On June 14, Señor Alemeda, speaking in the Brazilian Senate, said, "Our foreign minister represents the high ideals of all South America in its efforts toward guaranteeing peace and general fraternization amongst the nations of this continent." During the course of this exchange of cordialities, it was remarked that the United States was Brazil's best customer for coffee and rubber, and that in 1912 the United States attracted more than one-fourth of Brazil's foreign trade—\$189,789,604 out of a total of \$670,212,140.

A protocol signed with Peru arranged for the organization of a commission to survey the frontier, in accordance with the treaty of demarcation of September 8, 1909. Extradition and arbitration conventions with Bolivia, and an arbitration agreement with Italy, were concluded. The Portuguese government sent a delegate to Rio de Janeiro to negotiate a treaty of peace and amity with Brazil. On May 9, plenipotentiaries of Brazil and Uruguay signed a convention establishing a new frontier line

between the two republics on the river San Miguel. Uruguay recognized Brazilian navigation rights on the river, which has heretofore been exclusively Uruguayan.

BRETHREN, CHURCH OF THE (also known as **Dunkers or Dunkards**). There are three groups of this denomination—the **Conservatives, Progressives, and the Old Order.** The first are the most numerous, numbering in the United States in 1913 95,000 communicants, 938 churches, and 3066 ministers. The **Progressive branch** is second in point of number. This had, in 1913, 20,394 communicants, 215 churches, and 192 ministers. The **Old Order** had about 4000 communicants, 72 churches, and 218 ministers. The **Conservative branch** maintains ten colleges and has one of the largest denominational training houses in the West at Elgin, Ill. It carries on missionary work in Europe and in India and China. The national conference of the denomination was held at Winona Lake, Ind., in June, 1913. The **Progressive brethren** maintained a college and publishing house at Ashlin, Ohio. In addition to these branches, there is also a small body known as the **Seventh-Day German Brethren**, which has about 250 communicants, 11 churches, and 8 ministers. It is found in the vicinity of Ephrata, Pa.

BRICK. See **CLAY-WORKING INDUSTRIES.**

BRIDGES. Bridge construction during 1913 was active especially in the United States and, at the same time, many steps were taken towards improving practice and carrying on investigations for increased construction and efficiency in the long structures required. The making of lofty steel buildings and bridges now forms an important industry in the United States and the value of such structures erected in the United States in 1912 was estimated at over \$400,000,000, an amount that was exceeded probably by 10 per cent. in 1913. It is, of course, impossible to distinguish between the amount of material going into bridges from that used for lofty buildings and similar structural work, but in bridge building, especially, there was manifested a continual demand for the use of the newer steels where nickel, vanadium, and other metals enter into the composition to give increased strength notwithstanding the fact that this is attended at greater cost. In this way the strength of the members of a bridge structure could be increased without increasing the weight, and this made possible longer spans whose weight, of course, had been the leading impediment hitherto to any increase in length. Furthermore in these new steels the effect of impact in very long spans is reduced so that higher unit strains can be used and types of construction subject to considerable vibration and deflection in short spans can be applied to longer spans with safety and efficiency. As a result it was suggested that the suspension type of structure could be used for spans longer than those in existence without any increase in the present size of individual members.

Perhaps the boldest conception of the year was involved in the preliminary designs and estimates prepared for an eight-track 3880-ft. suspended span across the North River at New York to carry railroad, electric, and highway

traffic into New York City. An estimate of \$42,000,000, for its construction was made by the promoters, but no positive action toward the adoption of the plans was taken. As regards actual construction, however, the most important bridge work was the 1800-ft. span of the \$9,000,000 super-structure of the Quebec bridge. This was the largest span yet to be undertaken and probably no bridge ever designed or constructed had involved more research and investigation, particularly in view of the failure of the former structure at this site while under construction. Large scale carbon and nickel steel models of the members were tested to obtain an adequate idea of the ultimate strength of the alloy steel used and the engineers expressed their satisfaction at the efficiency of the connections and the details of construction provided for this structure. A bridge shop at Montreal was equipped for the construction of the Quebec bridge: the plant and machinery were both of the highest grade and of an unusual capacity, so that pieces up to 90 feet in length and 140 tons in weight could be machined and handled. This was said to have involved an expenditure of \$1,000,000.

The construction of the East River bridge of the New York connecting railways, which, with its approaches mainly of viaducts, was begun in July, 1912, continued and the contract for the superstructure, consisting of a notable arch span of 977-ft. 5-in. in length, the longest yet essayed, and weighing 19,000 tons, was awarded to the American Bridge Company. This span will be 135-ft. above the water at Hell Gate.

NEW MISSISSIPPI RIVER BRIDGE AT MEMPHIS. A new double-track railway and highway bridge 2015½ ft. in length was under construction during the year across the Mississippi River at Memphis, Tenn. The superstructure consists of two lines of pin-connected trusses 88-ft. in maximum depth and 32-ft. apart on centres carrying at the level of the bottom-chord two railroad tracks between them and two 14-ft. cantilever highways. In the middle of the river there is a 621-foot independent simple truss span which, next to the 668-foot spans of the St. Louis municipal bridge, is the longest of the kind yet built. The main cantilever span is 790 feet 5½ inches in length, thus making it one of the longest cantilever spans in bridge construction, with, of course, such notable exceptions as the Queensboro bridge and the Quebec bridge. The superstructure of the new Memphis bridge is 76 feet in the clear above high-water level and it is carried by reinforced concrete piers which have been carried down through deep water to pneumatic-caisson foundations. These piers are faced with granite and those for the main span have a height of 147 feet above the top of the caisson foundation, which is 46½ feet below low-water level.

WILLAMETTE RUN BRIDGE. The Broadway bridge across the Willamette River at Portland, Ore., with a total length overall of 2987.5 feet, was completed and open to traffic on April 22, 1913. This bridge consists of two Pratt truss and four Baltimore truss spans, 125 to 297 feet long and a two leaf bascule span 278 feet long. There are also approach sections of plate-girder spans and retaining wall road-bed construction. The bridge affords a clearance in the centre of 65 feet at high water and 93 feet at the lowest stages, but by raising the

bascule leaves sailing vessels, or ocean going steamers, can be passed through. The river piers were sunk by the pneumatic process to a maximum depth of 85.25 feet below water, and at the pier near the west shore the excavation was pushed to 73 feet below the river bed, with a total immersion of 101 feet, giving a pressure of 44 pounds. The substructure cost \$607,820, while the contract price of the superstructure was \$763,380,097. The bascule leaves are operated by two 75-horse power 600-volt motors and represent the most modern developments in this field. The bridge was designed and built under the supervision of Ralph Modjeski, of Chicago, the total cost to the city counting all expenses was about \$1,600,000.

OHIO RIVER BRIDGE. The Ohio River bridge at Kenova during the year was renewed, and as it had five 518-foot river spans about 100 feet above the water it presented erection features of difficulty and magnitude. The new trusses were outside of the old ones, being erected as cantilevers, while the latter were in service and were adjusted for final connection by vertical movement of the adjacent spans which were used temporarily as anchors.

CUMBERLAND RIVER BRIDGE. Among the bridge work of the year was the Cumberland River bridge of the Louisville and Nashville Railroad, a structure 3000 feet in length, including viaduct approaches at each end. The river section consisted of one 300-foot and three 200-foot through truss spans and three 135-foot deck truss spans, all riveted except the 300-foot span, which was pin constructed. The piers were of concrete and the foundations went down to bed rock, a distance of 130 feet below the bottom of the rails.

BASCULE BRIDGES. During the year 1913 the Baltimore and Ohio Railroad completed a new double-track bascule bridge of the heel trunnion type, with a single-leaf span across the Calumet River at South Chicago. This span has a length of 230 feet on centres and replaces a horizontal revolving span occupying so much less room that it will be possible to construct on adjacent ground a similar span permitting a four-track crossing where previously only a double-track was available. The superstructure of the bridge consists of a 230-foot through-riveted truss bascule span, a 65-foot approach, and a 50-foot plate-girder tower span, a tower approximately 70 feet in height, and a counterweight truss about 100 feet long pivoted on the tower and provided with a counterweight weighing 2200 tons and the operating mechanism. The bridge experienced a severe test in that it stood open with the truss vertical for almost a year without endangering either its safety or stability and without affecting its ultimate use. The bridge contains 2,800,000 pounds of structural steel, 305,000 pounds of machinery, and 1100 cubic yards of concrete in the counterweight. The tower and bascule trusses are of riveted construction, 31 feet 3 inches apart on centres and the main trusses are 39 feet deep. The counterweight trunnions and the pins through the counterweight links are 20 inches in diameter with babbitted bearings and bushings of phosphor-bronze. The delay in utilizing the bridge during the year was due to the fact that the adjacent drawspan of the Lake Shore and Michigan Southern Railroad, which is to be replaced by a new bridge of the bascule type,

swings over the front pier of the Baltimore and Ohio span.

CANADA. An important bridge project in Canada during the year was the renewal of the Lachine bridge, 3657 feet in length, across the St. Lawrence. This bridge was built originally in 1886 as a single-track structure and its replacement was effected without interruption of traffic or navigation. New double-track spans take the place of the old superstructure and the length of a number of the spans has been reduced by one-half by the construction of intermediate piers, a tendency that, it may be remarked by the way, has been noted in a number of important bridge renewals.

Notable bridge construction was in progress on the Canadian Pacific Railway. This line crosses the South Saskatchewan River with a bridge 3004 feet in length and having a maximum height of 147 feet. It consisted of eight spans of 240 feet in length with shore spans from 45 to 80 feet, all supported by concrete piers. This bridge was completed during the month of June, 1913.

A large reinforced concrete bridge was built across the Saskatoon River in Canada, consisting of 10 arches ranging from 25 feet to 115 feet, making it the largest bridge of reinforced concrete in Canada. It furnished an interesting problem in concrete construction, as the range of temperature was found to be 140 degrees.

SOUTHWARK BRIDGE, LONDON. During the year it was definitely decided to replace the beautiful Southwark bridge over the Thames, which was completed in 1819, as it was deemed insufficient in capacity and on account of its deep approach grades. The old bridge was formed of 3 cast-iron rib spans, the centre one being 210 feet and the others 210 feet. For the new bridge the old abutments will be used and the spans will be the same number, the centre one being 140 feet 6 inches, the next two 131 feet 9 inches, and the abutment spans 123 feet. The headway will be reduced to a minimum of 26 feet, enabling the grades to be reduced to 3.3 per cent., while an increase will be made the width of the roadway, making it 35 feet and the sidewalks 10 feet, part of the latter being carried on cantilevers. Four new piers will be built, two at the centre being 15 feet wide and 42 feet high, and the others 14 feet wide and 41 feet high, being founded on steel caissons sunk under compressed air and filled with concrete. Each span of the bridge will consist of 7 steel ribs, ranging in depth from 3 feet 3 inches to 3 feet 6 inches.

FRANCE. A long viaduct for the railway from Miramas to L'Estaque in the south of France was under construction with a length of 3093 feet. The masonry had been completed at the end of the year and the steel superstructure was in progress, a draw span designed to be open only five minutes being one of the features of the work.

SWITZERLAND. Several important reinforced concrete bridges were under construction in Switzerland. A bridge across the Aare, near Bern, at Halem, had a main arch of 286 feet span, 131 feet above the water, with four 68-foot 9-inch arches on the south side and two 32-foot 10-inch girders on the north side.

INDIA. Progress continued during the year on the Sara Ghat, across the lower Ganges River, 150 miles north of Calcutta, in northern Ben-

gal. This bridge was referred to in the *YEAR BOOK* for 1912 and consists of a truss structure of 15 through spans, 345 feet $1\frac{1}{2}$ inches from centre to centre of bearings and 359 feet from centre to centre of piers, and six plate-girder deck-approach spans each 75 feet in length, the total length from abutment to abutment being about 5890 feet. Each main span is 52 feet deep at the centre and has a clearance of 40 feet above water at high water level and 71 feet at low water level, the rise of the river during the monsoon season, with its enormous discharge, rendering the design quite a difficult problem.

During the year the Bengal Northwestern Railway Company completed its $1\frac{1}{4}$ -mile bridge at Allahabad, consisting of forty 150-foot spans. The doubling of the East Indian double-deck bridge over the Jumna at Delhi was completed in February, it being a structure with twelve 216-foot spans. A similar process of doubling was being undertaken with a bridge over the same river at Allahabad. The drawbridge over the Yalu of six 300-foot spans on the Antun-Mukden Railway was approaching completion at the end of the year.

EGYPT. A new bridge opened in Egypt during the year was the Manshura bridge over the Damietta branch of the Nile, 88 miles from Cairo and consisting of four 230-foot spans. The bridge at Jebba which had to carry the main line of the Nigerian Railway over the Niger was in progress during the year.

BRAZIL. A new bridge over the River Potergy, near Natal, the capital of the Rio Grande do Norte, Brazil, was under construction and had ten 164-foot spans.

BRIGGS, CHARLES AUGUSTUS. An American theologian and educator, died June 8, 1913. He was born in New York City in 1841. From 1857 to 1860 he studied at the University of Virginia, and at the Union Theological Seminary from 1861-62. He then took up studies in Germany and graduated from the University of Berlin in 1869. In the same year he became pastor of the Presbyterian Church at Roselle, N. J., remaining in that position until 1874, when he resigned to become professor of Hebrew and cognate languages in the Union Theological Seminary. In 1891 he was appointed to the chair of Biblical theology. For ten years beginning 1880 he was editor of the *Presbyterian Review*. In 1891 he was charged with heresy. These charges were based upon an address in which it was asserted that church and reason were each "the fountain of definite authority, which apart from the Scriptures may and does savingly enlighten men"; that "errors may have existed in the original text of the Holy Scripture"; that "many of the Old Testament predictions have been reversed by history"; that "Moses was not the author of Pentateuch"; that "Isaiah was not the author of a portion of the book which bears his name"; that "the processes of redemption extend to the world to come"; and that "sanctification is not complete at death." On these charges Dr. Briggs was acquitted by the presbytery of New York. The decision was appealed to the general assembly of the Presbyterian Church which suspended him. The Union Theological Seminary, in spite of this decision, refused to remove him from its faculty. Dr. Briggs entered the Protestant Episcopal Church, and was ordained clergy-

man of that denomination in 1899. Among his numerous published writings on theological subjects are: *The Bible, the Church, and Reason* (1892); *The Higher Criticism of the Hexateuch* (1893); *The Messiah and the Gospels* (1894); *The Messiah and the Apostles* (1895); *The Case of Dr. Briggs*; *General Introduction to the Study of the Holy Scripture*; *Ethical Teachings of Jesus*; *Commentary on the Psalms*; and *Fundamental Christian Faith* (1913). He was also editor of the *International Theological Library* and the *International Critical Commentary*.

BRIGGS, FRANK OBADIAH. Former United States senator from New Jersey, died May 8, 1913. He was born in Concord, N. H., in 1851 and graduated from the United States Military Academy in 1872. He was assigned as second lieutenant to the Second Infantry, which was then at Atlanta, Ga. He remained in the army until 1877, when he resigned to accept a position with the Roebling Company of Trenton, N. J. He soon became assistant treasurer of this company and head of several of its subsidiaries. In 1901 he was named by Governor Voorhees state treasurer. He was elected for the full term of three years by the legislature of 1902 and reelected three years later without opposition. On the withdrawal of John F. Dryden from his seat in the Senate in 1907, Mr. Briggs was made his successor. He did not take a conspicuous part in the debates of the Senate and there was criticism of his vote on tariff questions. He was thought to be unduly solicitous regarding corporation interests. A faithful worker, his courtesy and simplicity made him one of the most popular members of the Senate.

BRITISH COLUMBIA. A province of the Dominion of Canada, between Yukon Territory on the north, the United States on the south, Alberta on the east, and the Pacific Ocean and Alaska on the west. Area, 355,855 square miles; population (1911 census), 392,480, representing an increase of 119.7 per cent. in ten years. Population of the principal cities (1911 census): Vancouver, 100,401; Victoria, the capital, 31,660; New Westminster, 13,199; Nanaimo, 8306; Prince Rupert, 4184. British Columbia became a province of the dominion July 20, 1871. The chief executive is the lieutenant-governor, who is appointed by the governor-general of Canada; he acts through an executive council (responsible ministry) of seven members. The legislative assembly consists of 42 members, elected by direct vote for four years. Lieutenant-governor in 1913, Thomas W. Patterson (since December 3, 1909); premier, Sir Richard McBride. See CANADA.

HISTORY

THE VANCOUVER COAL STRIKE. The intervention of the provincial government in a strike of the coal-miners on Vancouver Island attracted much attention throughout Canada and in the press of other countries. The trouble was a development of a one-day-strike of the employes of the Canadian Collieries Company at Cumberland, occasioned by the miners' belief that the company was neglecting to clear out the dangerous gases in a portion of the mines. The company refused to rehabilitate the strikers. As a protest against the lockout at Cumberland, the miners at Nanaimo, nearby, started a sympathetic strike on May 1, 1913. Over 3000

miners participated in the strike, and the coal industry on Vancouver Island was paralyzed. As the strike continued through May, June, and July, the miners' demands became more definite and more determined. First of all, they desired higher wages, better conditions of labor, and more careful provisions for safety of life—the fatalities had increased 200 per cent. in the last two years, they claimed. Secondly, they required the discharge of Italian and Chinese strike-breakers and the reinstatement of all the strikers. In the third place, they demanded recognition for their union—a local of the United Mine Workers of America. This last point was furiously denounced by the officials of the company on the ground that it was unpatriotic to allow Canadian industry to be controlled by a labor organization whose headquarters were in the United States. The strike was being engineered by foreigners, the employers pointed out, and must therefore, be dangerous to Canada. In reply, the *Federationist*, the labor organ of British Columbia, explained that the real objection to the U. M. W. of A. was not based on the patriotism of the employers, but on their fear lest the miners, backed by a powerful organization, would be able to enforce their demands for higher wages, for the abolition of the truck system, and for prevention of accidents. The controversy grew more heated, especially when strike-breakers were imported, and resulted in riots at Nanaimo on August 11, at Ladysmith and South Wellington on August 12 and 13, and at Extension on August 13 and 14. Although up to this time the strikers had been very peaceable, and were still willing to observe order if left unmolested by strike-breakers, Mr. Bowser, who had just become acting governor, thought it necessary to intervene. On August 15 he dispatched troops to Nanaimo and martial law was established on the island. Many strikers were arrested—258 in all—and detained for trial without bail. During their detention the prisoners were accorded the treatment due convicted criminals—a circumstance which subjected the government to much criticism. Finally in October Judge Howay sentenced five men to two years' imprisonment (the maximum allowed by law), twenty-three to sixteen months, and eleven to five months. The penalties imposed were unexpectedly severe, and in some cases unfair procedure was alleged. Many demonstrations were organized in protest, and the Dominion Trades and Labor Congress appealed to the minister of justice on behalf of the prisoners. The majority of the prisoners were tried at special assizes in Westminster later in the year. Meanwhile the strike continued, except at "Jingle Pot" mine, where the union demands were conceded. The trades and labor congress requested the Dominion minister of labor to compel the employers to submit to arbitration. Instead, Mr. Samuel Price was sent as a royal commissioner to investigate labor conditions on the island. He reported that the accident rate there was not so high as elsewhere and that the miners were well treated. This report failed to bring satisfaction, however, and was characterized by the labor press as grossly unfair and manifestly inaccurate.

BRITISH EAST AFRICA. See EAST AFRICA PROTECTORATE, UGANDA, and ZANZIBAR.

BRITISH GUIANA. A British colony on the northeast coast of South America, including

the settlement of Demerara, Essequibo, and Berbice, with an area of 90,277 square miles and (1911) 296,041 inhabitants. Unenumerated aborigines were estimated at 10,000. Immigrant population (East Indians) on estates: 9141 under indenture, 38,120 not under indenture, 16,684 children; not residing on estates, 62,893; total, 126,838. Capital, Georgetown, with 57,528 inhabitants (1891). Excepting for the estates schools, the schools are denominational; 221 received government aid during 1911-12 amounting to £29,628; and accommodated 35,430 scholars. The cultivation of sugarcane is the predominant industry, the 44 sugar estates in active operation covering 156,666 acres, of which 73,324 are devoted to sugarcane. The 1911-12 export amounted to 99,368 tons of sugar (mostly Demerara crystals), 3,022,831 pf. gallons of rum, 146,740 gallons of molasses, and 5102 tons of molascuit. About 30,000 acres are under rice, the export for 1911-12 (6,686,820 lbs.) being valued at £40,163. Timber abounds. Gold export (1911-12), 51,196 ozs. (£190,733); diamonds, 6976 carats (£11,772). The total imports and exports (1911-12) amounted to £1,786,574 and £2,172,765 (£1,749,766 and £1,820,198 in 1910-11), inclusive of transit, £89,259 (£97,998). The Demerara Railway Company, Limited, runs a line from Georgetown to Rosignol (Berbice), 60½ miles, and one from Vreeden Hoop to Greenwich Park, 15 miles; and receives a government subsidy. A branch (18¾ miles) affords access to the gold diggings. Revenue and expenditure (1911-12), £593,498 and £588,625 (£563,100 and £542,757 for 1910-11). Public debt, March 31, 1912, £885,815. Governor (1913), Sir W. Eger-ton (July 5, 1912).

BRITISH HONDURAS. A British colony in Central America, south of Yucatan, having an area of 8598 square miles and a population numbering (1911) 40,510. Belize is the capital, with (1911) 10,478 inhabitants. Most of the schools are denominational, receiving government aid. The colony's important industry is wood-cutting, the export in 1911 consisting of 13,020,580 superficial feet of mahogany, 1,543,744 of cedar, and 3231 tons of logwood. Fruit is a considerable export: 450,365 bunches of bananas, 2,853,445 plantains, and 5,198,899 coconuts in 1911. Sapodilla gum (3,219,990 lbs.), rubber (24,192 lbs.), sponges (9822 lbs.), and tortoise shell (3367 lbs.) are also produced. Total imports and exports for 1911 amounted to \$2,886,677 and \$2,685,849 respectively (\$2,819,217 and \$2,344,380 in 1910). Specie export, \$18,200.

From Stann Creek a short railway leads inland; this line was practically finished by 1910, but much damage was done by floods in 1911, necessitating some reconstruction.

Revenue and expenditure (1911-12), \$1,201,908 and \$532,123 (\$459,295 and \$542,810 in 1910-11). Tonnage entered and cleared, 588,367. Governor (1913), Col. Sir. E. J. E. Swayne.

BRITISH INDIA. See INDIA, BRITISH.

BRITISH NEW GUINEA. See PAPUA.

BRITISH NORTH BORNEO. The northern portion of the island of Borneo, with adjacent islands; it constitutes a protectorate, under the jurisdiction of the British North Borneo Company. Area, 31,000 square miles; population, about 208,000. Sandakan is the capital. There is a considerable trade in indigenous products. Agriculture has developed,

and the export of tobacco is large. Coal, iron, and oil are present. There are 120 miles of railway. Imports in 1911, S S \$4,803,071; exports, 4,836,795; revenue, 1,366,768; expenditure, 829,251. Shipping entered and cleared (1911), 353,308 tons. Governor in 1913, J. S. Mason.

BRITISH SOMALILAND. The camel constabulary corps of 150 men, established in 1912 under the command of Mr. Corfield to maintain order within a radius of 50 miles of Berbera, came into conflict on August 9 with a large force of dervishes at Dul Madoba. The constabulary corps lost 36 killed and wounded, but inflicted much heavier losses on the dervishes. Mr. Corfield, who was killed in the engagement, was freely criticized for venturing upon so disastrous an expedition into the interior, contrary to the policy of coastal concentration adopted in 1909. Nevertheless, Mr. Corfield's plan for pacifying the natives received subsequent vindication in a decision of the British government, whereby the camel constabulary was doubled in strength.

BRITISH WEST AFRICA. See articles on GAMBIA, GOLD COAST, NORTHERN NIGERIA, SOUTHERN NIGERIA, and SIERRA LEONE.

BROOKLYN RAPID TRANSIT COMPANY. See RAPID TRANSIT.

BROWN, ADDISON. An American jurist, died April 9, 1913. He was born at West Newbury, Essex County, Mass., in 1830. After graduating from Harvard College in 1852, he attended the Harvard Law School, beginning practice in New York City in 1855. After two years he entered the firm of Stanley, Langdell & Brown. In 1881 he resigned from this firm to accept an appointment as United States district judge for the southern district of New York. Judge Brown was notable for his clearness and the strength of his decisions. Many of these, taken to the United States Supreme Court, brought him much commendation from that tribunal. In addition to his legal interests he was a recognized authority in botany. He wrote the *Illustrated Flora of the United States and Canada* (1896, 1898). One of the founders of the New York Botanical Garden, he was at the time of his death its president, and also president of the Torrey Botanical Club of New York.

BROWN, HENRY BILLINGS. An American jurist, died September 4, 1913. Born in Lee, Mass., in 1836, and graduated from Yale College in 1856, he studied law privately, and attended lectures at the Yale and Harvard law schools. Admitted to the bar in 1860, in the following year he was appointed deputy United States marshal for the eastern district of Michigan. After serving in this office until 1863 he was appointed assistant United States attorney for this district; and in 1868 was appointed judge of the Circuit Court of Wayne County, Mich., but served in this position only a few months. He removed to Detroit and practiced there until 1875, when he was appointed United States district judge for the eastern district of Michigan. In 1890 he became an associate justice of the Supreme Court of the United States, and remained a member of it until 1906, when he retired. He was distinguished as an admiralty lawyer, and compiled the *Brown's Admiralty Reports*. While serving on the bench of the Supreme Court, his sight failed, and for a time

he was nearly blind. Although he recovered partially, he never after saw distinctly.

BROWN, JOHN GEORGE. An American artist, died February 8, 1913. He was born in Durham, England, in 1831. After leaving school he was apprenticed to a glass cutter. His desire to become an artist caused him to work nights, sketching from memory people and objects that had caught his attention. His first art instruction was received at the School of Design in Newcastle. Subsequently he won a prize for the best drawing from the antique, while he was studying at the Royal Academy. He opened a London studio and began to paint portraits with a fair measure of success. In 1854 he came to this country, settled in Brooklyn, and secured employment in glass works in that city. Meantime he set up a small studio and looked about for commissions as a portrait painter. His chief artistic interest, however, was in the life of the streets, and he studied especially the characteristics of street urchins, and began to paint them. He sold his early pictures at small prices, but for "The First Cigar" he received one hundred and fifty dollars, and this work added greatly to his reputation. In 1860 he exhibited for the first time at the National Academy of Design and in the following year was made a member of the academy for his picture "Curling in Central Park." In 1869 he was elected president of the academy. He was also president of the American Water Color Society from 1887-94 and of the Artists Fund Society for ten years. At Paris in 1889 he received honorable mention, and a silver medal at the Buffalo Exposition. From 1899 to 1904 he was vice-president of the National Academy of Design.

BROWN, WILLIAM GARROT. An American historian, died October 19, 1913. He was born in Marion, Ala., in 1868, and graduated from Howard College, Ala., in 1886. At Harvard he took his A. B. degree in 1891 and A. M. in 1892. From 1893 to 1901 he was an assistant in the Harvard University library, was lecturer on American history at that university in 1901-02. He was the author of: *Official Guide to Harvard University* (1899); *The History of Alabama* (1900); *Andrew Jackson* (1900); *Stephen Arnold Douglas* (1902); *The Lower South in American History* (1902); *A Gentleman of the South* (1903); *The Foe of Compromise, and Other Essays* (1903); *The Life of Oliver Ellsworth* (1905). He also contributed to magazines and for many years was a regular editorial writer for *Harper's Weekly*.

BROWNE, FRANCIS FISHER. An American editor, died May 11, 1913. He was born in South Halifax, Vt., in 1843. He learned the printer's trade and attended high school at Chicopee, Mass. In 1862 he left school for service in the Civil War, enlisting in the 46th Massachusetts Volunteers. In 1866-67 he studied law at Rochester, N. Y., and at the University of Michigan. In 1869 he became editor of the *Lakeside Monthly*, and continued in this position until 1874. In 1878-79 he was literary editor of *The Alliance*. In 1880 he became editor of *The Dial* and continued to fill this post until the time of his death. Under Mr. Browne's editorship *The Dial* became one of the few authoritative literary and critical journals published in the United States. Mr. Browne was the author of *Every-day Life of Abraham Lincoln* (1866), *Volunteer Grain* (a

volume of poems (1896). He edited many collections of prose and verse, including *Bugle Echoes*, a collection of poems of the Civil War, Northern and Southern. He also edited the "Laurel Crowned" series of standard poetry (1890-92). He was chairman of the committee of the congress of authors at the World's Congress Auxiliary of the Columbian Exposition in 1893. He was one of the founders in 1874 of the Chicago Literary Club, and was an honorary member of the Caxton Club of Chicago.

BROWN UNIVERSITY. An institution for higher education, founded at Providence, R. I., in 1764. The students in the autumn of 1913 numbered 976. Of these, 668 were undergraduates in the men's college, 203 under graduation in the women's college, and 100 graduate students. The faculty numbered 90. The faculty lost during the year two members by death—Lester F. Ward, LL. D., professor of sociology, and Prof. Thurston Phetteplace, assistant professor of mechanical engineering. Lucius Moody Bristol, Ph. D., was appointed professor of sociology and political science. The productive funds of the university on June 30, 1913, amounted to \$336,847. The number of volumes in the main library was about 220,000. The president is W. H. P. Faunce, D.D.

BRUNSWICK, THE GUELPHS AND. See **GERMANY.**

BRYAN, WILLIAM JENNINGS, Secretary of State in the cabinet of President Wilson. He was born in Salem, Ill., in 1860, and he was educated at Whipple Academy and Illinois College, Jacksonville, Ill. He afterwards studied law at the Union College of Law in Chicago. He began practice in Jacksonville in 1883, but in 1887 removed to Lincoln, Neb. In 1890 he was elected to Congress as a Democrat, and was reelected for a second term. During his two terms in the House he served on the ways and means committee and assisted in the preparation of the Wilson bill. In 1894 he was the Democratic candidate for United States senator, but on account of the election of a Republican legislature was not chosen. For several years he served as chief of the editorial staff of the *Omaha World-Herald*, and attended the Democratic national convention in 1896 as a representative of this paper. He was nominated for the presidency at this convention, and also by the Populist and Silver Republican convention of that year. He was defeated by Mr. McKinley. At the outbreak of the Spanish-American War, he raised the Third Nebraska Infantry and served as its colonel. He was renominated for the presidency in the Democratic convention of 1900, his nomination being again indorsed by the Populist and Silver Republicans, and was again defeated. Soon after he established *The Commoner*, a weekly paper devoted to political science, political economy, and sociology. In 1908, he was nominated for the presidency by the Democratic convention for the third time, and was for the third time defeated. After the election he devoted the greater part of his time to lecturing and editorial work until he was made Secretary of State on March 5, 1913. See **UNITED STATES, sections Cabinet, Diplomatic Service, Foreign Relations**, and any general article dealing with political history of the United States during 1913.

BRYN MAWR COLLEGE. An institution for the higher education of women, at Bryn

Mawr, Pa., founded in 1885. On December 1, 1913, there were enrolled in the college 386 undergraduates, 77 resident graduates, and 5 non-resident graduates, or a total of 465. The faculty numbered 65. The college received among other gifts, a donation of \$10,000,000 from Miss Mary E. Garrett for scholarship and other expenses. From other donors was received about \$7000. In 1913 the Phoebe Anna Thorne Graduate School of Education was opened, and in connection with it the Phoebe Anna Thorne Open Air Model School. The new infirmary, given by the class of 1905 and erected at a cost of \$47,000, was also opened during the year. The productive funds of the college amount to about \$1,900,000, and the library contains 72,000 volumes. The president is M. Carey Thomas, Ph.D., LL.D.

BUCK STOVE COMPANY CASE. See **BOYCOTT, and LABOR, AMERICAN FEDERATION OF.**

BUCKWHEAT. Estimates on the world's production of buckwheat are not published. The crop is largely grown in a supplementary way and the grain does not enter the world's markets on a very extensive scale. The acreage in any one country is generally limited and is subject relatively to greater variations than that of the more common crops. The acreage in England in 1913 was only 3686 acres, or over 26 per cent. less than in 1912. In the United States in 1913 805,000 acres were grown, or 36,000 acres less than in 1912, and the production was 13,833,000 bushels, as compared with 19,249,000 bushels the year before. The rate of yield was 17.2 bushels per acre, as against 22.9 bushels a year ago. The acreage in 1913 was the smallest since 1908 and the production the smallest since 1900. The farm price on December 1, 1913, was 75.5 cents per bushel and on this basis the crop value reached \$10,445,000, the lowest since 1907. The crop was reported by the Department of Agriculture as grown in 24 States, the States leading in production and their yields being as follows: Pennsylvania, 5,180,000 bushels; New York, 4,004,000 bushels; Michigan, 900,000 bushels; and West Virginia, 798,000 bushels.

BUDGETS. See **MUNICIPAL GOVERNMENT.**

BUILDING. See **ARCHITECTURE and FOUNDATIONS.**

BUILDING OPERATIONS. The table on the following page shows the building operations in a number of leading cities of the country in 1911 and 1912.

Of the forty-eight cities included in this table, thirty-one showed increases in the cost of building, and seventy-one showed decreases. The total increase was \$90,743,063, and the total decrease was \$39,260,314, a net increase of \$51,482,749. The greatest increase in 1913 was in New York City, the second was in Los Angeles. The greatest proportionate increase was in Atlanta, Ga. The largest decrease was in Chicago, and the largest proportionate decrease was in Fall River, Mass.

BUILDINGS, HEIGHT OF. See **CITY PLANNING.**

BULGARIA. A constitutional European monarchy; one of the "Balkan states." Capital, Sofia.

AREA AND POPULATION. The total area previous to the Balkan War was 37,199 square

a Figures supplied by the Bureau of Statistics, Department of Commerce and Labor. The number of permits or buildings was estimated. b Public buildings were not included.

miles (northern Bulgaria 24,614, eastern Rumelia 12,585). The Treaty of Constantinople, signed September 29, 1913, settles the Turkish-Bulgarian boundary as follows—from the mouth of the Maritsa the line follows the river to a point near Mandra, thence proceeds in a northerly direction to the west of Demotika and Adrianople; thence in an easterly direction, north of Kirk Kilise, to Seti Stefan on the Black Sea. (See TURKEY AND THE BALKAN STATES.) Total *de facto* population (according to the census of December 31, 1910. 4,337,513 (3,095,735 in northern Bulgaria and 1,241,778 in eastern Rumelia)—of whom 3,497,794 were Bulgarians, 466,117 Turks, 121,435 Tziganes, 79,787 Rumanians, 43,273 Greeks, 40,118 Jews, 21,145 Pomsacs, 18,050 Tatars, 12,914 Armenians, etc. Sofia, the capital, had 102,812 inhabitants; Philippopolis, 47,981; Varna, 41,419; Ruschuk, 36,255; Plevna, 23,049. Marriages in 1909, 38,917; births, 172,583; deaths, 113,304. The Orthodox Greek is the national religion, but the Bulgarian church is not included in the Orthodox communion. The school attendance for 1909-10 was reported at 430,011.

AGRICULTURE. The rural population is industrious and frugal; but obstinately averse to the introduction of modern methods. Their implements are comparatively primitive, but an extremely fertile soil and a favorable climate

combine to render the agricultural output the chief source of the country's wealth. The distribution of the soil in 1909 was as follows: 2,394,253 hectares in cereals, 523,371 in forage plants, 85,240 in vines, 60,259 in potatoes, etc., 25,231 in melons, etc., 13,215 in industrial plants, 11,088 in legumes, 8277 in orchards and gardens, 7621 in rose-fields—3,130,279 acres in all under cultivation; fallow, 742,498; 3,872,777 hectares, grand total. Details of the cereal crop follow:

	Hectares		Quintals	
	1912	1911	1912	1911
Wheat	1,120,500	1,118,409	17,350,000	19,596,528
Rye	215,000	220,721	3,150,000	3,751,176
Barley	260,000	251,778	4,000,000	4,425,593
Oats	160,000	180,797	1,750,000	2,967,735
Corn	650,000	631,935	14,000,000	7,770,420
Rice	3,000	2,319	30,000	30,238

COMMERCE AND COMMUNICATIONS. Import and export values, with the value of the cereal export, are shown below, in leva:

	1909	1910	1911
Imports	160,430,000	177,356,723	199,345,000
Exports	111,434,000	129,052,205	184,634,000
Ex. cereals.	80,811,200	129,390,000

Some details of the 1911 trade showing values of principal articles in thousands of leva are given in the following table:

Imports	1000 L.	Exports	1000 L.
Textiles	57,973	Cereals	129,390
Machinery, etc.....	25,612	Animal prods....	18,135
Metals, etc.....	23,811	Animals	8,341
Skins, etc.....	13,348	Perfumes	7,457
Col. prods.....	10,579	Textiles	6,842
Woodwares	8,825	Skins	3,612
Drugs, etc.....	6,507	Col. prods.....	1,845
Resins and oils...	4,898	Metals	904

Austria-Hungary contributed imports valued at 48,216,000 leva, and received exports valued at 10,567,000; Germany, 39,837,000 and 22,912,000; United Kingdom, 30,034,000 and 24,237,000; France, 24,927,000 and 11,119,000; Turkey, 15,986,000 and 29,210,000; Italy, 9,118,000 and 3,948,000; Belgium, 5,047,000 and 53,790,000. The number of vessels entered during 1911 was 18,818, of 4,951,452 tons; cleared, 18,792, of 4,934,559. The merchant marine contained five steamers (2776 tons) and three sailing (402).

COMMUNICATIONS. Railways in operation in 1911, 1928 kilometers, owned and operated by the state; under construction, 305 kilometers. State telegraph lines, 6521 kilometers; wires, 15,219; offices, 350. Post offices, 2220.

After the declaration of peace between Turkey and Bulgaria, the construction of a national railway connecting old Bulgaria with the Aegean Sea through Bulgarian territory became necessary as the old line to Dedeagatch went through Turkish territory. The new line decided upon in a cabinet council was to start from a station on the Philippopolis-Adrianople line, pass through Haskovo and Kirdjaldi, and terminate at Porto Lagos. This line would be 108 miles in length and would cost \$5,000,000, requiring three or four years for its construction, on account of the engineering difficulties involved.

FINANCE. The unit of value is the lev, worth 19.3 cents. The revenue for 1911 amounted to 178,445,300 leva (173,389,493 for 1910), and the expenditure to 178,395,443 (163,451,041). The 1912 budget follows:

Rev.	1000 L.	Expend.	1000 L.
Customs, etc.....	68,590	War	40,561
Direct taxes.....	39,841	Debt	40,148
Transport dues..	33,890	Railways, etc....	25,467
Revs. & domains	14,225	Instruction	24,916
Licenses	11,036	Interior	11,032
Leases	9,770	Finance	8,575
Fines	1,030	Public works.....	8,537
Other	11,891	Agriculture	7,283
		Foreign affairs...	6,458
		Justice	6,348
		Commerce	5,742
		Administration...	3,560
		Other	362
		Total	188,929
		Extraordinary..	25,056

The public debt stood, January 1, 1912, at 623,346,807 leva.

NAVY. The fleet contained at the opening of the war with Turkey six first-class torpedo boats, of 600 aggregate tons; one cruiser, of 735; two yachts, one transport, two second-class torpedo boats (twenty tons each), and some small craft.

ARMY. The army of Bulgaria during 1913 had a continued test of its organization and usefulness in the field. The sectional war

in the Balkans continued the need of troops, and a large number of volunteers were enlisted, while the older reserves and militia were brought into service. Naturally this led to the formation of new divisions and the extension of the army from its previous theoretical basis of organization. As a result of the military operations accurate statistics, or returns, are impossible to secure, but under the head of **TURKEY AND THE BALKAN PEOPLES** will be found discussed the part played by the Bulgarian army in the events of the year.

GOVERNMENT. The king (Ferdinand I. in 1913) is the executive, aided by a responsible ministry. The Sobranje (national assembly) has 213 elected members; the Grand Sobranje is composed of 426 deputies. Heir-apparent, Prince Boris. The ministry as composed July 4, 1913, was as follows: Dr. V. Radoslavov, premier and minister of the interior; Dr. N. Ghenadiev, foreign affairs; Dr. D. Tontchev, finance; P. Peechev, instruction; C. Popov, justice; C. Boyadjiev, war; J. Bakalov, commerce, etc.; Dr. P. Dintchev, agriculture, etc.; D. Petcov, public works; N. Apostolov, railways, etc.

HISTORY

OUTCOME OF THE WARS. The chief interest in Bulgaria in 1913 centred in the Balkan War—at first in the spectacular victories of Bulgaria in league with Greece, Servia, and Montenegro against the Turks, and subsequently in the tragic military collapse of Bulgaria before the combined assault of her former allies together with Rumania and Turkey. Both phases of the Balkan War are treated under **TURKEY AND THE BALKAN PEOPLES** (q.v.). The struggle cost Bulgaria dearly. An official list published on May 13, gave the country's losses in the first part of the war as 330 officers and 29,711 men killed, and 950 officers and 52,550 men wounded, while 3193 had disappeared. In December General Boyadiev, minister of war, stated that the whole war had cost Bulgaria about 100,000 men and over \$300,000,000 in direct, public outlay. A royal decree of October 14 abolished the state of siege which had existed in Bulgaria since September 30, 1912, and thenceforth the country resumed a more normal appearance. On October 16 a force of 25,000 men, under the command of General Tosheff, was dispatched to Thrace to reoccupy the territories finally left to Bulgaria by the treaty of Constantinople. The transfer from Turkish to Bulgarian hands was completed in November without disturbance, and General Tosheff, as military governor, promised to treat Christian and Musselman inhabitants alike. At about the same time the joint commission appointed to delimit the district ceded by Bulgaria to Rumania, completed its work, and it was reported that the commission delimiting the new Serbo-Bulgarian frontier was making satisfactory progress. By the close of the year Bulgaria had resumed diplomatic relations with all the Balkan states except Servia and Greece. Relations between Greeks and Bulgarians in Thrace were very much strained.

DOMESTIC POLITICS. The special session of the Sobranje, held from February 28 to May 13, was chiefly concerned with necessary legislative enactments affecting the conduct of the war. Probably its most important act was the authorization of an extraordinary military loan

of 50,000,000 leva. The successful conclusion of the treaty of London on May 30 greatly enhanced the prestige of King Ferdinand and of the Progressist-Nationalist cabinet headed by M. Gueshoff, but, in the latter case, only for a short time. A people intoxicated by swift and decisive victories against the Turks, thoroughly convinced of their own commanding position in the Balkan peninsula, were by no means willing to brook any real concession to Serbia or Greece in the division of spoils. M. Gueshoff, appreciating the state of mind of his countrymen and yet aware that Russia would not tolerate the full realization of Bulgarian aspirations, resigned office in June. The new cabinet, which was thereupon formed, represented a coalition, as before, of the Progressist and Nationalist parties, but its head, Dr. Daneff, was known as a diplomat of ability and experience, and as a pronounced Russophil he was expected to reap from the war very great results for his country. The members of the cabinet were as follows: Dr. Daneff, premier and foreign affairs; M. Madjaroff, interior; M. A. Ludskanoff, agriculture; M. D. Bouroff, commerce and industry; General Kovatcheff, war; M. Christoff, railways and posts; and the members of M. Gueshoff's cabinet who held the posts of finance, public instruction, justice, and public works.

It was intended that the ministry should be a patriotic group recruited from all parties, and in fact M. Malinoff, the Democratic leader, promised his parliamentary support; but Dr. Radoslavoff, the leader of the Liberal party, persistently held aloof. When on June 14 Dr. Daneff formally assumed office, he found the treasury exhausted, the harvests spoiling for want of reapers, and foreign relations in confusion. The situation was exasperating. On one side, his own desires and the firm determination of the nation prevented Dr. Daneff from making concessions to Greece or Serbia, or from securing a Balkan ally by granting favors to Rumania or Turkey, and on the other side a diplomatic deadlock between Austria-Hungary and Russia deprived him of the support of any of the great powers. And thus within a month of taking office, Dr. Daneff involved Bulgaria, now isolated and friendless, in war with Serbia, Greece, and Montenegro, and with Rumania and Turkey as well (see *TURKEY AND THE BALKAN PEOPLES*). Before the onslaught of such numerous enemies the Bulgarian defense collapsed, and it was charged that the *débâcle* was in part due to the failure of the ministry to work in harmony with the generals in the field. Consequently, in July, in the midst of the war, Dr. Daneff handed in the resignation of his cabinet. M. Malinoff, the Democratic leader, was then requested to form a ministry of all parties, but after four days he acknowledged his inability to do so. Then Dr. Radoslavoff formed a cabinet solely from the Liberal party, and in conjunction with M. Toncheff, minister of finance, set to work to extricate Bulgaria from the most crucial position in her history since the abdication of Prince Alexander of Battenburg.

The immediate task of Dr. Radoslavoff's ministry was to secure peace at any cost. This was effected by the treaties of Bucharest (August 10) and Constantinople (September 29). On October 6 the king signed a decree authorizing the completion and reconstruction

of the cabinet. Four vacancies were filled and several portfolios were exchanged. As finally rearranged the ministry was constituted as follows: Premier, Dr. Radoslavoff; foreign affairs, Dr. N. Genadieff; public instruction, M. P. Pesheff; finance, M. D. Toncheff; justice, M. C. Popoff; war, General Boyadieff; agriculture, M. P. Dintcheff; commerce and industry, M. T. Bakaloff; public buildings and roads, M. D. Petcoff; railways and posts, M. M. Apostoloff. The striking feature of this cabinet was that its new members, Dr. Genadieff, M. Apostoloff, General Boyadieff, and M. Popoff, were all Macedonians, the first two being natives of Monastir and the other two of Ochrida. It was the first occasion on which Macedonians had been entrusted with portfolios.

RUMORS OF ABDICATION. King Ferdinand was much chagrined by the outcome of the Balkan War, and in many quarters was personally blamed, though apparently quite unjustly. On October 6 he left Sofia ostensibly in order to visit relatives in Austria, and rumors became prevalent that he was determined to abdicate the throne unless he could gain positive assurance of good-will and assistance from Austria-Hungary. After a prolonged absence, however, he returned to Sofia on November 29, and was received cordially if not enthusiastically.

GENERAL ELECTION. A general election for the *Sobranje* took place on December 7. Ninety-five supporters of the government were returned, while the remaining 109 members were distributed among the seven groups comprising the opposition, as follows: Agrarians, 47; "Narrow" Socialists, 20; "Broad" Socialists 17; Democrats, 14; Radicals, 5; M. Gueshoff's party, 5; Zankovists (Dr. Daneff's party), 1. For the first time on record more than half the electors exercised the franchise, and the system of proportional representation, initiated at this election, afforded a fairer representation to minorities. The Socialists showed noteworthy gains. It was predicted that the ministry, which had suffered defeat at the polls, would effect a coalition that would enable it to retain office.

BUREAU OF CORPORATIONS. In the report of the Bureau of Corporations submitted December 22, Commissioner Luther Conant, Jr., presented a brief review of the work of the bureau during the ten years since its establishment. He pointed out that in general it had stood not only for publicity of corporate affairs, but also for the maintenance of competition in business. He pointed out that there has grown up a fairly widespread opinion that the effort to maintain competition should be abandoned, and that the inevitability of monopoly under governmental regulation should be recognized. While granting that the subordination of competition to regulation must be conceded so far as railroads and other public utility corporations are concerned, the commissioner held that the attempt to preserve competition in other fields should not be abandoned without a more extended and persevering effort. He showed that experience in the regulation of monopoly could be gained at the same time, so that in the event of failure to maintain competition the experience of an organization necessary to effective regulation of monopoly would be available.

He recalled that the bureau had made investigations of the petroleum, the steel, the

KING FERDINAND AND QUEEN ELEANORA OF BULGARIA

lumber, the beef, and the tobacco industries; that it had inquired into the control and development of water power; transportation by water, including the ownership of terminals; cotton exchanges, and the taxation of corporations. The International Harvester Company had also been the object of one of its investigations (see below). In all of these inquiries the bureau has striven to maintain an attitude of discrimination and of scientific candor. As a result the findings of the bureau have been well received by the public, and have had much weight of authority. These findings have furnished the basis of judicial proceedings against the Standard Oil Company, the United States Steel Corporation, and the American Tobacco Company. The bureau's report on transportation of petroleum in 1906 was soon followed by the voluntary elimination of many discriminations among shippers. Its report on the petroleum industry was likewise followed by the abandonment of several competitive methods; so also the exposition of unfair practices in the tobacco industry led to their elimination. The report on cotton exchanges led to the introduction of new rules; while that on cotton tare, though recent, bids to have similar results. The Steel Corporation had been led to surrender its monopolistic control of Lake Superior ore by the bureau's report on the steel industry. All of these were the beneficial results of the publicity given to clear and unprejudiced information.

In view of past experience the commissioner pointed out that the work of the bureau would be greatly facilitated and its power as an agent of publicity would be greatly increased should a law be enacted requiring the automatic submission to the bureau by large corporations engaged in interstate commerce, of data regarding their capitalization, properties, valuations, earnings, and personnel at regular intervals without definite solicitation by the bureau.

The bureau issued a report on "Control of Water Carriers by Railroads and by Shipping Consolidations." This was the result of inquiries regarding transportation on the Great Lakes and along the Atlantic seaboard. It showed that the regular lines of shipping on the lakes are controlled by railroads, being usually western connections of roads terminating at Buffalo. Rates of transportation by water-and-rail are slightly under all-rail rates. On the Atlantic seaboard the Merchants' and Miners' Transportation Company is controlled by the New Haven Railroad. Other lines are northern extensions of southern roads terminating at Gulf or Atlantic ports; others constitute a coastwise combine; Long Island Sound lines are controlled by the New Haven Railroad; and other lines north of New York and Boston constitute the Eastern Steamship Corporation. The report showed clearly that, although the ocean itself may be free, terminals and suitable connections with land transportation are subject to considerable monopoly control. The report, however, showed that there were some carriers on the lakes, notably those transporting coal and phosphate rock, which are not subject to such control. It would seem that in the absence of competition, the extension of governmental control of rates for water transportation is reasonable.

Report of the Bureau of Corporations on the International Harvester Company, issued

in March (pp. xxiii, 284), in addition to a summary contains chapters on: Conditions before formation; organization of the company; capitalization compared with investment in 1902; subsequent development; profits and prices; productive efficiency and financial resources; competitive methods. Though the principal cause of consolidation was competition, nevertheless the bureau found that the total profits of the five combining companies for the period 1898-1902 were \$43,000,000. The original capitalization of \$120,000,000 was, in the estimate of the bureau, about \$11,000,000 more than the physical valuation. This, however, may have been covered by good will. As regards efficiency, the bureau found the average cost in trust plants much lower than in independent plants, due mainly to large-scale production. The selling expenses of the combine, however, were relatively greater than those of independents, due to the trust's elaborate selling organization. The great financial resources of the company give it the completest benefits of large-scale production, and numerous advantages in selling, including ability to grant long time credit. As to competitive methods, the report stated that the company had resorted to various unfair practices, including bogus independents, factors' agreements requiring agents to handle company lines exclusively, suggested retail price lists, designating prices and terms, and misrepresentation of competitors. These practices were resorted to less frequently in recent years. By acquisitions and extensions the company was found to have acquired great importance in branches of the farm-machinery industry other than harvesters. The profits on net assets were computed by the bureau at 12½ per cent. for 1909-1911. The trust was found to be selling at higher prices abroad than at home, but in some lines at a lower margin of profit.

BUREAU OF SOCIAL HYGIENE. This bureau was established in 1912 by John D. Rockefeller, Jr., Starr J. Murphy, Paul M. Warburg, and Katherine B. Davis. It purchased eighty acres of land near the New York State Reformatory for Women at Bedford, and erected thereon an extensive laboratory. This was in charge of Miss Davis, who was head of the reformatory. The purpose of the bureau is to work out for the courts the scientific method of disposing of girls convicted of crime. It will especially seek out the psychological, social, and pathological conditions which predispose girls to a wayward life.

The bureau undertook a thorough and comprehensive study of vice conditions in New York City under the direction of George J. Kneeland, who had been in charge of the work of the Chicago Vice Commission; of vice conditions throughout the United States and a similar study of Europe, through Abraham Flexner, and an investigation of European police systems by Raymond Fosdick. Mr. Kneeland's study, *Commercialized Prostitution in New York* (Century Company); covered the period from January to November, 1912. He investigated 142 parlor houses, 1172 resorts, 112 furnished-room assignation houses, 90 disorderly hotels, and 300 massage parlors, of which 75 were blinds for vice resorts. The investigators counted nearly 15,000 prostitutes, of whom nearly 7000 were on the streets. Details are given of the receipts and expenses of resorts of different

grades and the part played by inadames, procurers, brothel-keepers, liquor venders, and slavers. It showed clearly that exploitation for profit is the mainspring of social vice, the profit in selling girls, in selling their services, in selling clothes for them, in selling liquor to their customers and in renting houses and apartments for them. Details are given of saloons, concert halls, cabaret shows, dance halls, burlesque theatres, amusement parks, and excursion boats which cater to vice. The report also set forth the open and brazen manner in which the men in control of the white slave trade buy and sell their "slaves" and properties, and purchase protection from the police. See PROSTITUTION.

BURLEIGH, EDWIN CHICK. An American public official, elected United States representative from Maine in January, 1913 (see MAINE). He was born in Linneus, Me., in 1843. At the outbreak of the Civil War he enlisted for service, but illness prevented his passing the medical examination. He served in the office of the State adjutant-general and the State land office from 1870-76. The two years following he was assistant clerk in the State House of Representatives, and from 1880-84 he was a clerk in the office of the State treasurer. He was elected State treasurer in 1885, serving until 1889. In 1889 he was elected governor of the State, serving until 1892. In 1897 he was elected to the Fifty-fifth Congress and was reelected successively to all Congresses up to the Sixty-first. Mr. Burleigh was a successful candidate in the primary election held in September, 1913. His election to the legislature resulted from a combination of Republican and Progressive members.

BURLESON, ALBERT SIDNEY. An American lawyer and public official. Postmaster-General in the cabinet of President Wilson. He was born in San Marcos, Texas, in 1863, graduated from the University of Texas in 1884, and admitted to the bar in 1885, in which year he became assistant city attorney of Austin, Tex., holding this office for five years. In 1891 he was appointed attorney for the twenty-sixth judicial district, Texas. He was elected to the Fifty-sixth Congress in 1899 and was reelected to successive Congresses up to and including the Sixty-third. He took a prominent part in the campaign for the nomination and election of President Wilson.

Rice	1913	6,100,000	293,000	127,000
	1912	1,400,000	70,000	64,000
Potatoes	1913	68,000	8,092,000	5,664,000
	1912	78,000	10,140,000	6,591,000
Hay	1913	2,400,000	3,600,000	48,600,000
	1912	2,500,000	3,825,000	52,402,000

a Tons.

at \$19,713,478, compared with \$19,738,908 in 1911. The total gold output in placers from copper-lode and zinc ores decreased in 1912, but the production from siliceous ores increased nearly an equal amount. The deep mines yielded \$11,078,815, and the placers produced \$8,845,653. Dredges produced 85.9 of the placer yield in 1912, and 38.6 of the total yield. The leading counties in gold production in 1912 were Amador \$2,796,194, Yuba \$2,753,408, Butte \$2,346,229, Nevada \$2,081,958, Sacramento \$1,712,587 and Tuolumne \$113,291. The silver production of the State in 1912 was 1,300,136 fine ounces, compared with 1,270,245 ounces in 1911. The larger part of the output, 792,445 ounces in 1912 came from smelt and copper ores.

California is the largest producer of petroleum. The production in 1912 was 86,450,767 barrels, compared with 81,134,391 barrels in 1911. The average price received for oil in the State in 1912 was 45.4 cents per barrel, compared with 47.7 cents in 1911. The features of particular interest during 1912, were the development of large wells of unusual length in the La Habra Valley field, a continued development of large gushers in the valley fields, and the decline in the old Santa Maria field. The Coalinga territory was extended by the development of good wells to the south, and its value was enhanced by the increased utilization of natural gas including the enterprise for piping natural gas from the valley fields to Los Angeles, and by the increased amount of gasoline obtained by compressing natural gas. The Midway field in Kern County is the largest producer. In this field there were taken in 1912 23,928,368 barrels of petroleum. From Coalinga field in Fresno County there were taken 19,911,820 barrels, and from the Kern River fields in Kern County, were taken 12,558,439 barrels. The total number of productive wells in the State at the end of 1912 was 5947.

The production of copper in 1912 was 31,516,471 pounds of blister copper, compared with 35,835,651 pounds in 1911. The reduction in output for the State since 1911 was due to the necessity of eliminating, from the smelter-smoke, ingredients injurious to vegetation. This resulted in the shutting down of all but one of the smelters in the Shasta County district. At the close of 1912 California produced about 518,487,000 pounds of copper. In total output the State ranks fifth among coffee producers, and for yearly production in 1912 it ranks seventh. Four plants treated copper ores in the State in 1912. The main production comes from two districts—the Shasta and Foothill districts, although numerous other districts have small outputs, and copper minerals are widely distributed over the State.

The total production of coal in 1912 was 10,978 short tons, valued at \$23,601. On account of the large production of petroleum in California and its use for fuel, coal-mining in the State has practically ceased.

California is one of the most important producers of clay products. The total value of these products in 1912 was \$5,912,450, an increase of \$996,584 over the product of 1911. The chief clay product is common brick, which is valued at \$2,198,303.

EDUCATION. The total enrollment in the public schools of the State in 1913 was about 430,000, and the average daily attendance was 400,000. The teachers numbered about 1450, and the average yearly salary for male and female teachers was about \$900 a year.

FINANCE. The total receipts for the biennial period July 1, 1910, to June 30, 1912, amounted to \$39,323,132, and the disbursements to \$36,620,818, leaving a balance on hand on June 30, 1912 of \$9,903,533. The balance at the beginning of this period was \$7,201,219. The chief receipts are from the taxation of franchises and from county taxation. The total bonded indebtedness of the State on June 30, 1912, was \$6,068,519.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State with their populations in 1913 are as follows: Industrial Home for Adult Blind, 113; Whittier State School 136; Preston School of Industry 513. These are all reformed schools. In the Stockton State Hospital, were 2100 patients; in the Napa State Hospital 1990; in the Agus State Hospital 1356; in the Mendocino State Hospital 1022; and in the Southern California State Hospital 1970; or a total of 8438. Sonoma State Home has 228 inmates. There were 1913 prisoners in the San Quentin State Prison, and 1136 in the Folsom State Prison. The total number in all State institutions was 13,280. The legislature of 1913 provided for two new State institutions, a State training school for girls, and a new psychopathic State hospital. The State board of charities was given additional duties, including that of licensing maternal hospitals, boarding homes for children, etc.

POLITICS AND GOVERNMENT. The political history of the State in 1913 had, to a large extent, a national complexion, as the result of the passage by the legislature of a bill limiting the ownership of land by aliens, and directed toward eliminating Japanese as owners and proprietors of land. This movement logically followed other attempts to limit the rights of Japanese in California. The first of these was in 1906, when the Japanese, as a result of the shortage of native labor in California and the consequent higher scale of wages, began to come in large numbers from Hawaii to California and other coast States. The Japanese immigration was bitterly opposed by the labor element of San Francisco, which was then in political control. This feeling manifested itself in riots, in which Japanese were assaulted, and in an attempt to prevent Japanese children from attending public schools of that city. The difficulty was overcome through the efforts of President Roosevelt. The legislature of 1909 attempted to pass various stringent measures which prohibited Japanese ownership of land, segregated Japanese children in schools, and placed other restrictions upon the Japanese and other Orien-

tals. President Roosevelt again interfered, and as a result of his protests to the governor and the legislature, these bills were dropped.

The legislature of 1913, early in its session, passed a measure advocating the extension of the Chinese exclusion act to all Asiatics. This bill was passed, and the attitude of the legislature foreshadowed other measures restricting the rights of land ownership by the Japanese. On April 15, the Assembly passed a measure prohibiting the ownership of land, in terms which were offensive to the Japanese government. At the same time a bill was introduced in the State Senate which was less stringent in its terms, but which also called forth protests from Japan. The Assembly bill provided that an alien may acquire property and hold it for one year, after which it may be taken by the State by a suit brought by the district attorney or the attorney-general. In order to hold property longer than a year the alien must declare his intention to become a citizen. Property must not be leased to any alien for a period of more than five years. The most significant section of the bill was that which provided that every corporation, the majority of the issued capital stock of which is owned by aliens ineligible to become citizens of the United States, shall be considered an alien within the meaning of the act. This was regarded by the Japanese as a discrimination, for it was held in California that the Japanese are ineligible to become citizens. The Senate bill limited the power of all aliens to hold and lease land, and in terms it promised to protect all treaty rights. It did not discriminate against aliens not eligible for citizenship. This bill called forth informal protests from several countries other than Japan.

The importance of the points at issue as related to the friendly relations between Japan and the United States seemed so important to President Wilson that on April 19 he sent to Governor Johnson, and through him to the legislature and the people of California, two telegraphic letters. In the first of these, which was sent in the name of Secretary Bryan, the President advised against the use of the words "ineligible to citizenship" contained in the Assembly bill. He stated that he preferred the bill which was pending in the Senate because it omitted these words. In the second of the letters, which was signed by the President himself, he said: "If they (that is, the California legislature and people) deem it necessary to exclude all aliens who have not declared their intention to become citizens from the privileges of land-ownership, they can do so along lines already followed in the laws of many of the other States and of many foreign countries, including Japan herself."

The dispatch of these letters was followed by a proposal from President Wilson that Mr. Bryan should visit California, if such action were agreeable to the California legislature, for the purpose of counseling and coöperating with its members in framing a law which would meet the view of the people of the State, and yet leave untouched the international obligations of the United States. Governor Johnson and the legislature promptly indicated that they would welcome such a visit.

On the receipt of the telegram announcing that Secretary Bryan would be a welcome visitor, the latter started for California. He

was received with respect and cordiality, and his suggestions and representations were listened to with attention. It was evident, however, that the sentiment of the legislature was for immediate action by the State in the form of a law leaving to the courts the interpretation and to the State Department and the President the task of adjusting relations with Japan, if necessary, by a new treaty or otherwise. Mr. Bryan made four suggestions for possible action on the part of the legislature.

First: To delay immediate action and permit the State Department to frame a new treaty with Japan.

Second: To delay immediate action and appoint a legislative commission to investigate alien ownership and act with President Wilson in gaining relief.

Third: To enact a law similar to the Illinois statute, which allows all aliens to hold land for six years.

Fourth: To enact a law similar to the Federal statute in the District of Columbia, which applies to all aliens.

In presenting these suggestions, Mr. Bryan said: Each State acts in a dual capacity. It is the guardian of the local affairs of its people and in a sense the only guardian, and yet each State is a member of the Union and one of the sisterhood of States. Therefore, in acting upon questions of local conditions, the State always recognizes that it is its duty to share the responsibility with other States in actions affecting the nation's relations with foreign nations."

In place of acting upon the suggestions of Mr. Bryan, the legislature gave its attention to a new bill, which was framed by Attorney-General Webb. The first provision of this bill was as follows: "All aliens eligible to citizenship under the laws of the United States, may acquire, possess, enjoy, transfer, and inherit real property, or any interest therein, in this State in the same manner and to the same extent as citizens of the United States, except as otherwise provided by the laws of this State." The second provision was as follows: "All aliens other than those mentioned in section 1 may acquire, possess, enjoy and transfer real property, or any interest therein, in the manner and to the extent and for the purpose prescribed by any treaty now existing between the government of the United States and the nation and country of which such alien is a citizen or subject, and not otherwise." It was held by the advocates of this bill that, as it specifically guarded treaty rights and also affirmatively conferred rights on all aliens eligible to citizenship, instead of debarring from existing rights those ineligible, it was free from objection or offense. President Wilson telegraphed to Governor Johnson that in his opinion the Webb bill would involve an appeal to the courts on the question of treaty rights and would bring on what might prove to be a long and delicate litigation. The so-called Webb bill passed both houses of the legislature on May 3, but Governor Johnson had promised President Wilson that a reasonable time should elapse before the bill should be signed by him. This was intended to afford an opportunity for any communications on the subject from the national government. The bill as it passed contained an amendment to Section 2, noted above, which gave the class of aliens specified in that section the specific right to lease lands for agricultural proposes

for a term not exceeding three years. After the passage of the Webb bill President Wilson on May 11 sent a request through the Secretary of State that Governor Johnson should withhold his signature in order to give the Federal government an opportunity to take up the question diplomatically with Japan. To this suggestion Governor Johnson made a detailed reply. He declared that it was his duty to sign the bill unless "some absolutely controlling necessity demands contrary action." He outlined at some length the situation as it was regarded by the legislature and himself, and in his opinion, by a great majority of the people of California. This view may be summed up as follows: "We have violated absolutely no treaty rights; we have shown no shadow of discrimination; we have given to no nation the right to be justified in taking offense." Governor Johnson recalled the fact that when California adopted its present Constitution more than thirty years ago, a clause was included declaring the presence of such foreigners a danger to the well-being of the State. He also pointed out, as he had previously done, that other States had enacted laws similar to the Webb bill; that the naturalization laws of the United States determine who are and who are not eligible for citizenship; that California ought not to be accused of invidious discrimination when it follows in this regard the statutes of the United States; and that the immigration bill which passed both houses of the Sixty-second Congress excluded certain classes described as "persons who cannot become eligible under existing laws to become citizens of the United States," and that no protest had been made in or out of Congress on the score of the use of such language. Governor Johnson laid stress upon the fact that existing treaties are made a part of the law; and that not only are all rights to acquire real property which are granted under the treaty carefully observed, but that an additional privilege is given through the amendment permitting aliens not eligible to citizenship to lease agricultural land for a period of three years. The Webb law, he said, affects only the ownership of agricultural land about which absolutely nothing was said in the treaty of 1911. He declared that the bill absolutely maintains the national good feeling of the government and leaves no excuse for a claim on the part of the Japanese that they are in any way deprived of legal or treaty rights. As to the feeling of the Japanese on the basis of the legislation, that there was an intention of offensive discrimination, Governor Johnson declared that the real question is "not whether any offense has been taken, but whether justly it should be taken." He said that there was no ground for offense on the part of any nation, "particularly in the instance of a nation like Japan that in its own laws prevents acquisition of land by aliens." The governor declared that the problem in California is acute, and that agitation has been continuous in regard to agricultural lands, until finally an attempted solution became imperative. He said that he believed such legislation was necessary for the protection and preservation of the State and added "We must see it or be blind."

The basis of the objection to the passage of the alien laws on the part of Japan, was Article 1 of the treaty made in 1911. This article contains the following clause:

"The citizens or subjects of each of the high contracting parties shall have liberty to enter, travel, and reside in the territories of the other; to carry on trade, wholesale and retail; to own or lease and occupy houses, manufactories, warehouses, and shops; to employ agents of their own choice, to lease land for residential and commercial purposes, and generally to do anything incident to or necessary for trade upon the same terms as native citizens or subjects, submitting themselves to the laws and regulations there established."

This treaty of its adoption became, of course, a part of the supreme law of the United States. The United States Constitution explicitly provides that "all treaties made or which shall be made under the authority of the United States shall be the supreme law of the land; and the judges in every State shall be bound thereby, anything in the Constitution or the laws of any State to the contrary notwithstanding." The bill went into effect on August 10. Throughout the remainder of the year notes continued to be exchanged between the American and Japanese governments in relation to the bill, but these were not made public. For a further discussion of the matter see UNITED STATES, section *Foreign Relations*.

Another series of incidents which, from their connections with the Federal government, had a national interest, were connected with the indictment of M. R. Diggs and F. D. Caminetti, under the White Slave act for abduction. Caminetti is the son of the commissioner of immigration. On June 21, John L. McNab, Federal district attorney of San Francisco, resigned, and at the same time made public a long dispatch to the President, in which he asserted that he was forced to hand in his resignation because the attorney-general, against his protest, had ordered a postponement of the trial of Diggs and Caminetti. This trial was to have been held shortly after the date above, but as Caminetti's father wished to be present at the trial, and as his presence in Washington was desired by the Secretary of Labor, the attorney-general at the request of the latter, postponed it until August. After the publication of Mr. McNab's letter, the House committee on the judiciary sent for all papers relating to the case, and several of these were made public. Among them were letters and telegrams in which Mr. McNab earnestly argued against any postponement. Mr. Bryan in his newspaper *The Commoner*, published a strong defense of Attorney-General McReynolds' action. The President accepted Mr. McNab's resignation, and appointed another district attorney to succeed him. On the trial of the case, both were convicted.

For an account of the progress of the Panama Exposition, see EXPOSITIONS.

The long continued efforts of the city of San Francisco to obtain the right to use a portion of the Hetch-Hetchy Valley, a part of the Yosemite Valley, for a reservoir to supply water to the city, were brought to successful issue by the final passage of the bill in both houses of Congress permitting such action.

On February 23, the project was favored by a board of engineers composed of members of the corps of engineers of the United States army. This board, in effect, reported that the utilization of the Hetch-Hetchy site would be far less expensive than to obtain the water for the city from any other source suggested. Many persons

identified with conservation of public land, including Gifford Pinchot, were also in favor of the project. It was bitterly opposed by several organizations and individuals, including John Muir, the famous naturalist, and Robert Underwood Johnson, who was president of an organization formed especially to oppose the acquisition of the valley by San Francisco. A bill was introduced in Congress on July 23, and this gave the city of San Francisco permission to construct a dam in the Hetch-Hetchy Valley which would form a reservoir for water. This bill was bitterly attacked by Mr. Johnson in the statement issued on August 19. A measure passed the House, and after prolonged hearings, reached the Senate. Here, on account of opposition, action was postponed until Congress should reassemble in December. On December 6, the bill was taken up in the Senate, and after three days of debate was passed and signed by President Wilson.

LEGISLATION. The most important measures enacted were those relating to holding of lands by aliens. This is fully discussed in the previous sections of this article. In addition to this measure the legislature passed a blue-sky law, a State civil service law, a law providing mothers' pensions, a measure providing for the abatement of disorderly houses, the water conservation act, a law providing for a minimum wage commission for women and minors, with authority to fix minimum wages and hours of labor, an eight-hour law for underground workers, a sixteen-hour law for train and enginemen, a measure providing for the extension of the existing women's eight-hour law, a measure providing for the extension of the workmen's compensation act to establish automatic insurance system, an act providing for the appointment of delegates to investigate rural credits in Europe, a measure providing for non-partisan elections in counties, and a measure creating a legislative counsel bureau to advise and assist legislature. See also LIQUOR REGULATION.

STATE GOVERNMENT. Governor, Hiram W. Johnson, Progressive; Lieut.-Governor, A. J. Wallace; Secretary of State, F. C. Jordan; Treasurer, E. D. Roberts; Comptroller, A. B. Nye; Adjutant-General, Edwin A. Forbes, Attorney-General, U. S. Webb; Superintendent of Education, Edward Hyatt; Commissioner of Insurance, E. C. Cooper; Commissioner of Agriculture, R. L. Telfer—all Republicans, except Governor.

JUDICIARY. Supreme Court: Chief Justice, W. H. Beatty; Associate Justices, H. A. Melvin, Lucien Shaw, M. Angellotti, M. C. Sloss, F. W. Henshaw, W. G. Lorigan; Clerk, B. G. Taylor—all Republicans.

STATE LEGISLATURE. Democrats: Senate 12, House 25; joint ballot 37. Republicans: Senate 12; House 8; joint ballot 9. Progressives: Senate 27; House 46; joint ballot 73. Socialist: House 1; joint ballot 26. Progressive majority; Senate 14; House 2; joint ballot 26.

The State representatives in Congress will be found in the article UNITED STATES, section *Congress*.

CALIFORNIA, UNIVERSITY OF. A State institution for higher education, founded at Berkeley, Cal., in 1860. The total enrollment in the university for the collegiate year 1912-13 was 7296, of whom 4094 were academic undergraduates, 648 graduate students, 315 in the colleges of law, medicine, and pharmacy, 191

in the university farm, and 294 in the San Francisco Institute of Art. There were 719 members of the faculty, of whom 460 were in the academic departments. In 1913 Hubert E. VanNorman was appointed dean of the university farm school. There were many other important departments in the faculty of this school. Dr. R. G. Boone was appointed professor of education, and acting director of the School of Education; and C. E. Rugh was appointed a professor of education. The noteworthy benefactions received during the year included an endowment for the George Williams Hooper School of Medical Research, with 5000 acres of redwood timber land, valued at between one and two million dollars. A fund of \$600,000 was given for a new teaching hospital for the medical department. The productive endowment fund of June 30, 1913, amounted to \$5,022,088. The income for the year ending on the same date was \$1,938,987. The library contains about 300,000 volumes and several hundred thousand manuscripts. The president is Benjamin Ide Wheeler, LL.D.

CAMBODIA. A French protectorate; part of the colony of French Indo-China (q.v.), bordering the Gulf of Siam, and extending from Siam and Cochin-China to Annam and lower Laos. The majority of the native population are Khmers. The country is well watered. Rice is the principal cultivated product; legumes, fruits, and industrial plants thrive. A principal source of revenue is the output of the inland lake fisheries; the lakes are fished mostly by Chinese, Annamese, and Malays. Betel nuts, fresh and dried fish, timber, cacao, cinnamon, cardamoms, cotton, sugar cane, etc. are exported. The trade goes mostly through Saigon, and is included with that of French Indo-China. The capital, Pnom-penh, is picturesquely situated at the point where the Melsong separates into two branches. The local budget for 1912 balanced as 4,232,416 piasters. Native king, Sisowath. The French resident in 1913 was M. Outrey.

CAMPOS SALLES, MANUEL FERRAS. A former president of Brazil; died June, 1913. He was elected president in 1898. Under his administration the finances of the country were reorganized. In June, 1913, the rival political parties of Brazil had agreed to adopt Dr. Campos Salles as a conciliation candidate for the term 1914-1918, and he had consented to stand.

CANADA, DOMINION OF. A British self-governing dependency, including most of North America north of the United States. The capital is Ottawa, in the province of Ontario.

AREA AND POPULATION. The following table shows by provinces and territories, according to official returns in 1911: (1) Area in square miles (by planimetric calculation), including 125,765 square miles of water, but excluding the territorial seas, the Gulf of St. Lawrence, and the Canadian portion of the Great Lakes; (2) population as returned by the census of 1901; (3) population as returned by the census of June 1, 1911; (4) population increase per cent. between 1901 and 1911:

	Sq. m.	Pop. '01	Pop. '11	Inc.
Alberta	255,285	73,022	374,663	413.1
Brit. Columbia.	355,855	176,657	392,480	119.7
Manitoba	73,732	255,211	455,614	78.5
New Brunswick	27,985	331,120	351,889	6.3
Nova Scotia...	21,428	459,574	492,338	7.1
Ontario	260,862	2,182,947	2,523,274	15.6

	Sq. m.	Pop. '01	Pop. '11	Inc.
Pr. Edward Isl.	2,184	103,259	93,728	9.2
Quebec	351,873	1,648,898	2,003,232	21.5
Saskatchewan..	251,700	91,279	492,432	439.5
Yukon Ter.....	207,076	27,219	8,512	*68.7
Northw't Ters.	1,921,685	20,129	18,481	*8.2
Canada	3,729,665	5,371,315	7,206,643	34.2

* Decrease.

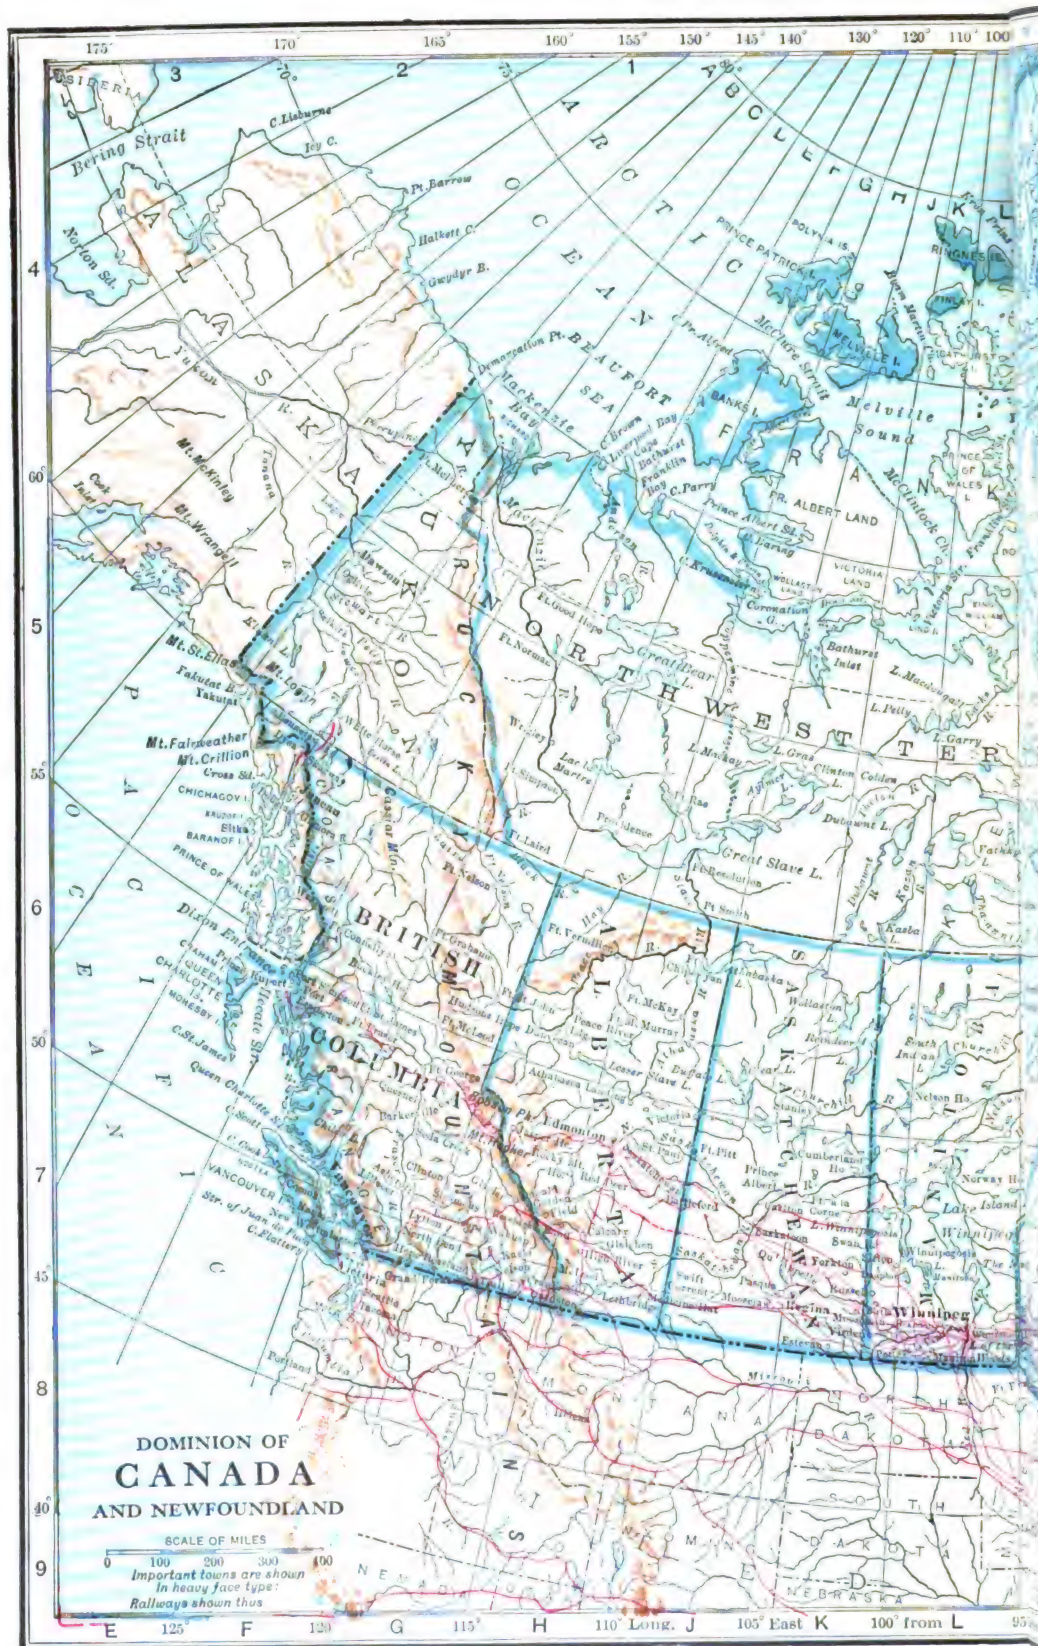

The population as stated in vol. i. of the 1911 census was 7,204,838; as stated in vol. ii., 7,206,643, owing to an increase of 520 in the returns from Quebec and 1805 in those from the Northwest Territories. The population as estimated June 30, 1913, was 7,758,000.

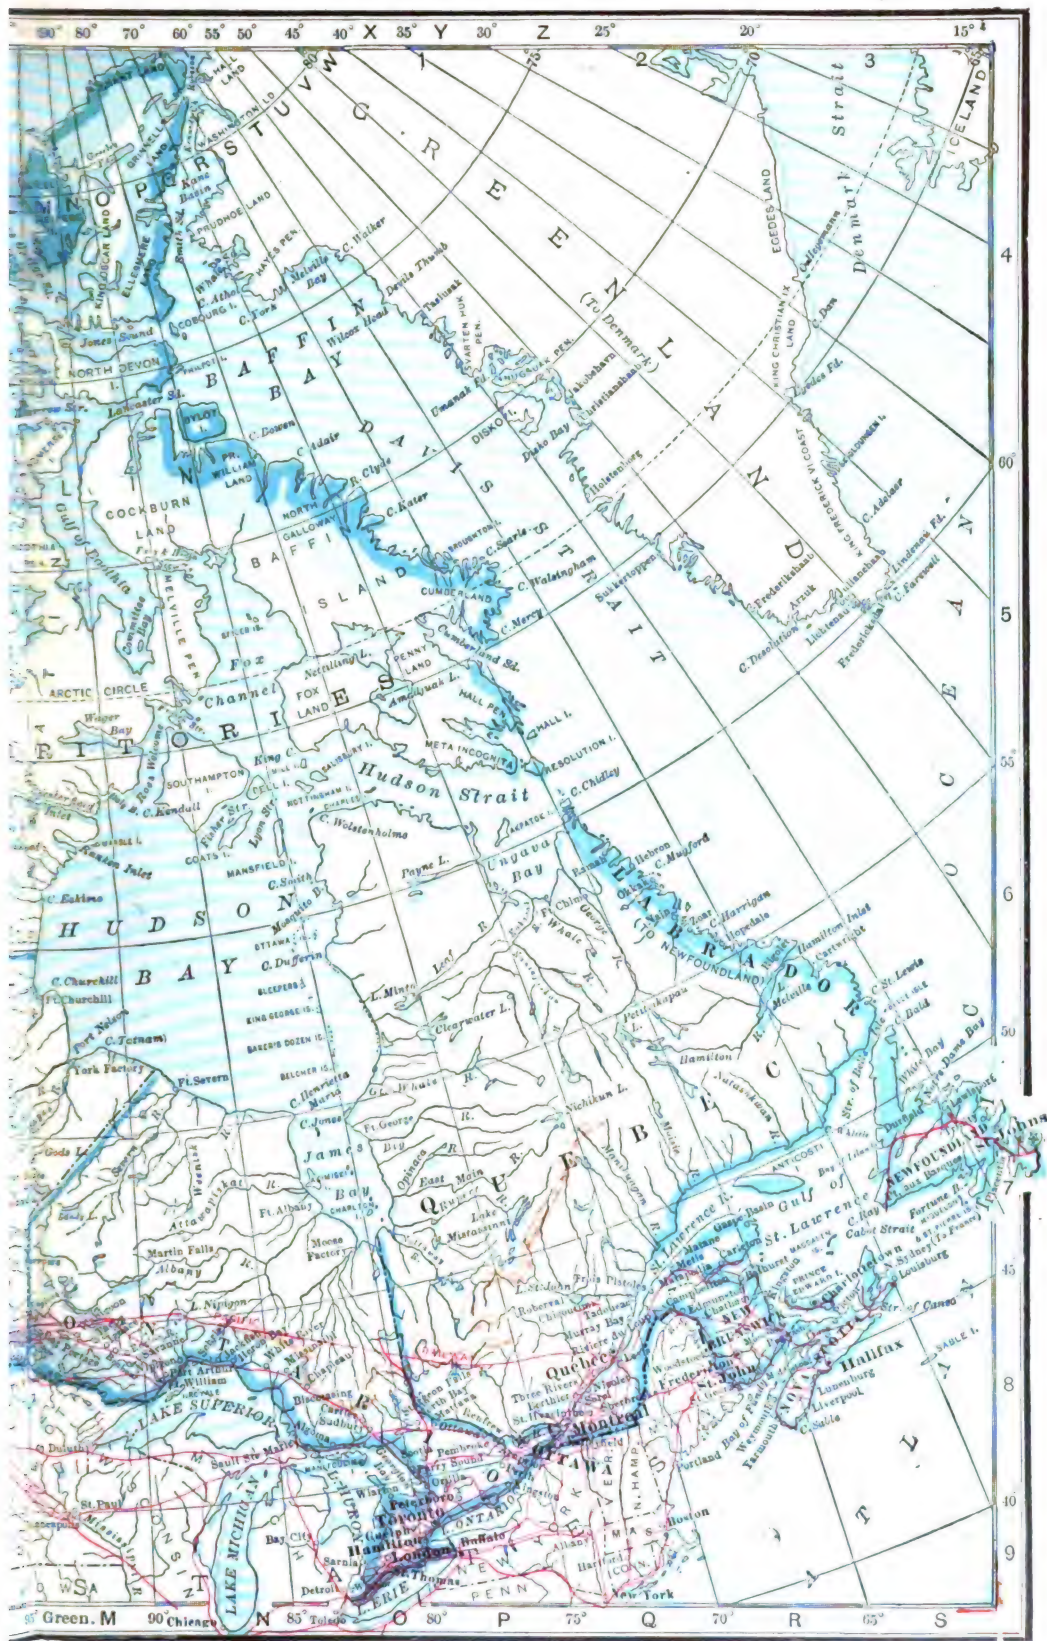

By the boundary extension acts, passed by the Dominion parliament in 1912 (proclaimed May 10 and in force from May 15, 1912), the provinces of Manitoba, Ontario, and Quebec were enlarged by the addition of areas that were previously part of the Northwest Territories. The boundaries of Manitoba were thus extended northwards to the 60th parallel of north latitude between the eastern boundary of Saskatchewan and the western shore of Hudson Bay; and from the point where the boundary of Manitoba and Ontario formerly coincided the boundary of Manitoba was carried due north to a point defined and thence northeasterly to the point where the 89th meridian of west longitude intersects the southern shore of Hudson Bay. The northern boundary of Ontario was extended to the southern shore of Hudson Bay, the new western boundary coinciding with the new eastern boundary of Manitoba. To the province of Quebec was added the whole of the former district of Ungava, so that now Quebec includes all of the peninsula of Labrador which is within Canada (the strip along the eastern shore of Labrador constitutes a dependency of Newfoundland) and is the largest province of the Dominion. The extent of these changes is shown in the following table (increase of area, present area, and population adjusted to the 1911 census):

	Inc. sq. m.	Sq. m.	Pop. '11
Manitoba	178,100	251,832	461,630
Ontario	146,400	407,262	2,527,292
Quebec	354,961	706,834	2,005,779
Northwest Ters.....	*679,461	1,242,224	5,900

* Decrease, equal to the increase of the three provinces.

The new district of Ontario has been named Patricia (after the Princess Patricia, younger daughter of the Duke of Connaught, governor-general of Canada). As at present constituted, it is bounded on the west and northwest by Manitoba, on the south and southwest by the English and Albany rivers and on the east and north by James and Hudson bays. Pursuant to an order in council, dated February 20, 1912, and subject to the future enactment by the Dominion parliament of the necessary legislation, Ontario will also possess a strip of territory (now within Manitoba) five miles wide lying between the district of Patricia and the Nelson River and to be located within 50 miles of the Hudson Bay coast, as well as an area half a mile wide and five miles in length to be located along the south shore of the Nelson River. The latter area is to be contiguous to the five-mile strip, and together those areas will afford ten miles of waterfront for harbor facilities and railway terminals.

As shown in the first of the preceding tables, the total population on June 1, 1911, was 7,206,643, representing an increase of 1,835,328 over the returns of April 1, 1901. For the period covered, the rate of increase, viz., 34.17 per cent., is the largest in the world and is due to the large increase of immigration beginning with the present century. Other countries for which data is available, in respect of the percentage rates of increase during the same decade, are: New Zealand, 30.5; United States, 21; Germany, 15.2; Netherlands, 14.8; Switzerland, 13.2; Denmark, 12.6; Belgium, 10.9; Austria, 9.3; United Kingdom, 9.1; Hungary, 8.5; Sweden, 7.5; Italy and Norway, 6.8; and France, 1.6.

Immense areas of Canada are not only uninhabited, or practically so, but unfit for habitation; the average density of population, according to the 1911 census, is 1.93 per square mile, calculated upon the total of 3,729,665 square miles. Prince Edward Island has a density of 42.91 per square mile; Nova Scotia, 22.98; New Brunswick, 12.61; Ontario, 9.67; Manitoba, 6.18; Quebec, 5.69 (figures for the latter three provinces are upon the basis of area as before the changes of 1912); Saskatchewan, Alberta, and British Columbia, each less than 2 per square mile.

Figures discriminating rural from urban population show, in the older parts of the Dominion, the trend of population from country to town.

	Pop. 1901		Pop. 1911	
	Rural	Urban	Rural	Urban
Alberta	52,399	20,623	232,726	141,937
Bt. Columbia	85,478	90,179	188,796	203,684

In 1911 the population comprised 3,821,995 males (53.03 per cent.) and 3,384,648 females (46.97 per cent.); the number of females per 1000 males was 886 (as compared with 952 in 1901), ranging from 308 in Yukon Territory and 560 in British Columbia to 980 in Quebec and 991 in Prince Edward Island. As compared with the Canadian average of 886, that of Ceylon is 888; New Zealand, 896; Australia, 926; Union of South Africa, 941; United States, 943; India, 953; Ireland, 1004; Italy, 1010; Hungary, 1019; Germany, 1026; Austria, 1036; Sweden, 1046; Scotland, 1063; England and Wales, 1068; and Norway, 1069. Conjugal condition of the people in 1911: Single, 2,369,766 males (32.88 per cent.) and 1,941,886 females (26.94); married, 1,331,853 (18.48) and 1,251,468 (17.37); widowed, 89,154 (1.24) and 179,656 (2.49); divorced, 839 and 691; legally separated, 1286 and 1584; not stated, 29,097 and 9363.

Classified in respect of birthplace, the population in 1911 was: Born in Canada, 6,453,911 (77.98 per cent.); British Isles, 784,526 (10.89); British possessions, 29,188 (0.41); British unknown and born at sea, 20,515 (0.28); Europe, 404,941 (5.62); Asia (exclusive of natives of British India), 40,948

(0.57); United States, 303,680 (4.21); all other countries, 3165 (0.4); total, 7,206,643.

The 1911 census showed 482,059 persons who had emigrated from their native provinces; of these, 352,735 had gone from the eastern provinces to the prairie provinces and British Columbia—89,311 to Manitoba, 16,006 to Saskatchewan, 77,367 to Alberta, and 70,051 to British Columbia.

Classified by principal religious denominations, the population in 1911 was as follows (with percentage of total for 1911 and 1901 respectively): Roman Catholics, 2,833,041 (39.31 and 41.51); Presbyterians, 1,115,324 (15.48 and 15.68); Methodists, 1,079,892 (14.99 and 17.07); Anglicans, 1,043,017 (14.47 and 12.69); Baptists, 382,666 (5.31 and 5.92); Lutherans, 229,864 (3.19 and 1.72); Greek Church, 88,507 (1.23 and 0.29); Jews, 74,564 (1.03 and 0.31); Congregationalists, 34,054 (0.47 and 0.53); Salvation Army, 18,834 (0.26 and 0.19); all others, 1.26 per cent. in 1911 and 4.09 in 1901.

Population of the larger cities according to the census of 1911: Montreal, Que., 470,480; Toronto, capital of Ontario, 376,538; Winnipeg, capital of Manitoba, 136,035; Vancouver, B. C., 100,401; Ottawa, Ont., capital of the Dominion, 87,062; Hamilton, Ont., 81,969; Quebec, capital of Quebec province, 78,710; Halifax, capital of Nova Scotia, 46,619; London, Ont., 46,300; Calgary, Alb., 43,704; St. John, N. B., 42,511; Victoria, capital of British Columbia, 31,660; Regina, capital of Saskatchewan, 30,213; Edmonton, capital of Alberta, 24,900; Brantford, Ont., 23,132; Kingston, Ont., 18,874; Maisonneuve, Que., 18,684; Peterborough, Ont., 18,360; Hull, Que., 18,222. The populations of Charlottetown and Fredericton, capitals of Prince Edward Island and New Brunswick, were 11,198 and 7208 respectively.

The birth rate for the Dominion in the year 1900-01 was 27.82, and the death rate 15.12. In 1911 the birth rate and the death rate by provinces was as follows: Alberta, 23.52 and 9.66; British Columbia, 14.88 and 9.32; New Brunswick (in 1900-01), 25.98 and 11.64; Manitoba, 34.93 and 12.03; Nova Scotia, 25.03 and 16.73; Ontario, 22.68 and 13.61; Prince Edward Island, 15.97 and 11.89; Quebec, 37.18 and 17.92; Saskatchewan, 17.76 and 5.54.

Immigrants arriving at inland and ocean ports in years ended March 31: 1911, 311,084 (of whom 123,013 from the United Kingdom and 121,654 from the United States); 1912, 354,237 (138,121 and 133,853); 1913, 402,432 (150,542 and 139,130). Chinese immigration in 1912, 6247; in 1913, 7445.

EDUCATION. The census of June 1, 1911, returned 6,319,160 persons of five years of age and over. Of these, 5,622,844 could read and write (88.98 per cent., as compared with 82.88 per cent. in 1901); 32,863 could read only (0.52 and 2.74); 663,453 could neither read nor write (10.50 and 14.38). The percentage of the population of five years and over who could neither read nor write was as follows in 1911 and in 1901, by provinces: Alberta, 12.72 and 30.56; British Columbia, 11.61 and 24.84; Manitoba, 13.31 and 14.55; New Brunswick, 14.05 and 16.19; Nova Scotia, 10.34 and 14.25; Ontario, 6.51 and 8.75; Prince Edward Island, 7.61 and 10.77; Quebec, 12.66 and 17.71; Saskatchewan, 13.70 and 35.11; Yukon,

13.58 and 35.13; Northwest Territories, 69.25 and 81.78. For Canada the percentages are respectively, 10.50 and 14.38.

Public instruction is controlled by the separate provincial governments. Primary education is free and, except in Quebec and Manitoba, compulsory.

Alberta. For years ended December 31, 1911 and 1912: Common schools, 1392 and 1601; enrollment, 61,660 and 71,044; average attendance, 32,557 and 39,227; amount expended on grounds and buildings, \$1,504,853 and \$2,041,485; amount expended on teachers' salaries, \$1,144,584 and \$1,411,201. Total expenditure (including interest) in 1912, \$6,667,282. The number of teachers employed during 1912 was 3054; the total number employed at any one time, 2229. Average salary per year paid to all teachers employed, \$769.89.

British Columbia. Years ended June 30, 1911 and 1912: Schools, 538 and 576; pupils enrolled, 45,125 and 50,170; average attendance, 32,161.74 and 37,567.88; teachers, 1179 and 1353; expenditure, \$2,641,522 and \$3,882,488.

Manitoba. For 1910: Enrollment, 76,247; attendance, 43,885; teachers, 2774; expenditure, \$4,000,671.

New Brunswick. For terms ended June 30, 1911 and 1912: Schools, 1885 and 1906; enrollment, 63,073 and 63,564; average attendance, 41,597 and 43,230; teachers, 1975 and 2015. Total number of different pupils in attendance during the school year 1910-11, 68,951; 1911-12, 69,199.

Nova Scotia. Years ended July 31, 1911 and 1912: Schools, 2639 and 2662; enrollment, 102,426 and 103,674; average attendance, 60,557 and 64,549; teachers, 2799 and 2804. The foregoing figures include high schools. Pupils in the common school grades in 1911 numbered 94,234 and in 1912, 95,316. The total provincial expenditure for education under all departments was \$1,379,332 in 1911 and \$1,453,610 in 1912.

Ontario. For the year 1911: Public elementary schools, 5921; enrollment, 400,552; average attendance, 244,674; teachers, 9349; expenditure, \$9,006,394. Roman Catholic separate elementary schools, 495; enrollment, 59,396; average attendance, 37,310; teachers, 1193; expenditure, \$897,890. Protestant separate elementary schools, 6; enrollment, 424; average attendance, 260. Kindergartens, 194, with an enrollment of 20,677. High schools and collegiate institutes, 148; enrollment, 32,227; average attendance, 20,177; teachers, 898; expenditure, \$1,948,058. Continuation schools, 129; enrollment, 5753; average attendance, 3487; teachers, 218; expenditure, \$252,080. Total enrollment in elementary and secondary schools, 520,255; average attendance, 313,624. Average cost per pupil (enrolled attendance) in all schools, \$23.26; average cost per pupil (average attendance), \$38.59.

Prince Edward Island. For 1911 and 1912: Schools, 475 and 474; enrollment, 17,397 and 17,078; average attendance, 10,511 and 10,916; teachers, 591 and 590.

Quebec. For 1912: Elementary schools, 5789 (enrollment, 229,234); model schools, 683 (107,775); academies, 248 (63,027); colleges, 20 (7818); special schools, 91 (9061); normal schools, 11 (836); schools annexed to normal schools, 11 (1418); universities, 3 (3446);

total, 6856 (422,615). Male lay teachers numbered 1160; male religious teachers, 2215; female lay teachers, 7461; female religious teachers, 4100; total, 14,926. Aggregate contributions for education in 1910-11, \$8,794,333; in 1911-12, \$7,414,469.

Saskatchewan. For 1910 and 1911: Schools, 1912 and 2110; enrollment, 63,964 and 70,567; average attendance, 33,731 and 37,701; teachers, 2672 and 3491; expenditure, \$3,655,428 and \$3,989,036.

AGRICULTURE. In 1911 the estimated total area under field crops was 32,853,074 acres, with a harvest value, according to average local market prices, of \$565,711,600; in 1912, 32,449,420 acres, with a harvest value of \$511,951,100. The decrease in 1912 is largely accounted for by the severe winter, which destroyed 326,000 acres of winter wheat. The following table shows the area in thousands of acres and the yield in thousands of bushels of principal field crops in 1911 and 1912:

	1000 Acres		1000 Bu.	
	1911	1912	1911	1912
Wheat	10,374	9,758	215,851	199,236
Oats	9,220	9,217	348,188	361,738
Barley	1,404	1,415	40,641	44,014
Rye	143	136	2,694	2,594
Peas	287	251	4,536	3,774

Sugar beets	21	19	177	204
Alfalfa	102	111	228	310

The area and yield of the wheat, oats, and barley crops in the three Northwest provinces:

	1000 Acres		1000 Bu.	
	1911	1912	1911	1912
Manitoba:				
Wheat	2,980	2,653	60,275	58,899
Oats	1,261	1,269	57,893	53,806
Barley	433	455	14,447	14,965
Saskatchewan:				
Wheat	4,705	4,892	97,665	93,849
Oats	2,124	2,286	97,962	105,115
Barley	172	180	5,445	5,926
Alberta:				
Wheat	1,617	1,417	36,143	30,574
Oats	1,178	1,359	56,964	62,936
Barley	156	175	4,151	5,780
Total:				
Wheat	9,301	8,962	194,083	183,322
Oats	4,563	4,914	212,819	221,857
Barley	762	810	24,043	26,671

Livestock estimates June, 1908, and June, 1912: Horses on farms, 2,118,165 and 2,336,800; milch cows, 2,917,746 and 2,890,100; other cattle, 4,629,836 and 4,093,600; sheep, 2,831,404 and 2,360,600; swine, 3,369,858 and 2,656,400.

HOMESTEADS. Ordinary homestead entries for lands of the Dominion government, pre-emptions under the Dominion lands act were as follows in 1911 and 1912:

	Homesteads		Pre-emptions	
	1911	1912	1911	1912
Manitoba	2,944	3,133
Saskatchewan	20,681	18,425	10,795	5,846
Alberta	14,960	13,668	7,557	3,101
British Columbia...	324	312
Total	38,909	35,538	18,352	8,947

Purchased homesteads numbered 1514 for 1911 and 1149 for 1912. Entries for South

African volunteer homesteads, 2064 and 166.

MINING. According to the preliminary official report, the total value of the mineral production of Canada in 1912 was \$133,127,489, as compared with \$103,220,994 in 1911. The increase amounts to nearly 29 per cent. The largest previous production was in 1910, compared with which that of 1912 shows an increase of over 24 per cent. The *per capita* production increased from \$15.44 in 1910 to over \$18 in 1912. In the latter year the only new camp of importance to contribute largely to the output was Porcupine, the gold production of which was about one and three-quarter million dollars. To a considerable degree the increase in the value of the 1912 output was due to a substantial advance in the price of most of the metals. The following table shows the quantities (in thousands) and the values (in thousands of dollars) of minerals produced in Canada in 1911 and 1912:

	Quantities		1000 \$	
	1911	1912	1911	1912
Copperlb.	55,648	77,776	6,887	12,709

FISHERIES. In the fiscal year 1912 the total catch was valued at \$34,667,872, as compared with \$29,965,433 in 1911 and \$29,629,170 in 1910. The inland fisheries in 1911 and 1912 returned a value of \$3,842,837 and \$3,824,997, respectively. For these two fiscal years the value by provinces was: Alberta, \$82,460 and \$102,325; British Columbia, \$9,163,235 and

\$13,677,125; Manitoba, \$1,302,779 and \$1,113,486; New Brunswick, \$4,134,144 and \$4,880,157; Nova Scotia, \$10,119,243 and \$9,367,550; Ontario, \$2,026,121 and \$2,205,436; Prince Edward Island, \$1,153,708 and \$1,196,396; Quebec, \$1,692,475 and \$1,868,136; Saskatchewan, \$172,903 and \$139,436; Yukon, \$118,365 and \$111,825; total, \$29,965,433 and \$34,667,872. The most valuable fish taken in the fiscal years 1911 and 1912: Salmon, \$7,205,871 and \$10,345,570; lobsters, \$3,784,099 and \$4,790,203; cod, \$5,921,248 and \$4,201,760; halibut, \$1,251,829 and \$2,278,824; herrings, \$2,278,842 and \$1,973,702; sardines, \$539,227 and \$1,241,526; haddock, \$1,218,759 and \$1,316,418; whitefish, \$983,594 and \$935,450; trout, \$825,290 and \$818,501; smelts, \$797,066 and \$780,520; mackerel, \$390,182 and \$663,280; pickerel, \$508,513 and \$536,711. The value of the whale oil produced increased from \$158,203 in the fiscal year 1911 to \$597,454 in 1912. In the fiscal year 1912, there were employed in the fishing industry 91,132 persons, of whom 65,926 were fishermen, who manned 1648 vessels and tugs and 36,761 boats. The capital invested was \$20,932,904, as compared with \$19,019,870 in 1911.

MANUFACTURES. The following statistics of Canadian manufactures are from the census taken in June, 1911, for the calendar year 1910. The table below shows the chief general results as compared with figures for 1900 (a number of establishments, b capital, c employes on salaries, d salaries, e employes on wages, f wages, g raw and partly manufactured materials, h products):

	1900	1910	Increase	Inc. p. c.
ano.	14,650	19,218	4,568	31.18
b\$	446,916,487	1,247,583,609	800,667,122	179.15
cno.	30,691	44,077	13,386	43.61
d\$	23,676,146	43,779,715	20,103,569	84.91
eno.	308,482	471,126	162,644	52.72
f\$	89,573,204	197,228,701	107,655,497	120.19
g\$	266,527,858	601,509,018	334,981,160	125.68
h\$	481,053,375	1,165,975,639	684,922,264	142.38

Capital (a) and value of products (b) were as follows in 1900 and 1910, respectively, by provinces: British Columbia, (a) \$22,901,892 and \$123,027,521, (b) \$19,447,778 and \$65,204,236; Manitoba, (a) \$7,539,691 and \$47,941,540, (b) \$12,927,439 and \$53,673,609; New Brunswick, (a) \$20,741,170 and \$36,125,012, (b) \$20,972,470 and \$35,422,302; Nova Scotia, (a) \$34,586,416 and \$79,596,341, (b) \$23,592,513 and \$52,706,184; Ontario, (a) \$214,972,275 and \$595,394,608, (b) \$241,533,486 and \$579,810,225; Quebec, (a) \$142,403,407 and \$326,946,925, (b) \$158,287,994 and \$350,901,856. In the territory included in Alberta and Saskatchewan the capital invested in manufactures in 1900 was \$1,689,870, and the value of products \$1,964,987. In Alberta in 1910 the capital was \$29,518,340, and the value of products \$18,788,825; in Saskatchewan, \$7,019,951 and \$6,332,132. Total Canada, in 1900 and 1910, respectively: Capital, \$446,916,487 and \$1,247,583,609; value of products, \$481,053,375 and \$1,165,975,639. Number of establishments in Canada, capital, and value of products in 1910, by groups:

	Estab.	Capital	Products
Food	6,985	\$ 133,044,523	\$ 245,669,321
Textiles	1,444	108,787,407	135,902,441

COMMERCE. The following table shows, in dollars, imports of merchandise for home consumption, of total merchandise, of coin and bullion, and total imports, in years ended March 31:

	Mdse. Home Consump.	Total Mdse.	Coin and B.	Total Imports
1908...	351,879,955	364,237,864	6,548,661	370,786,525
1909...	288,217,515	299,768,166	9,988,442	309,756,608
1910...	369,815,427	385,830,103	6,017,589	391,852,692
1911...	451,745,108	462,041,330	10,206,210	472,247,540
1912...	521,444,309	533,286,663	26,033,881	559,320,544
1913...	670,089,066	686,604,413	5,427,979	692,032,392

For the same years, exports of domestic merchandise, of total merchandise, of coin and bullion, and total exports:

	Domestic Mdse.	Total Mdse.	Coin and B.	Total Exports
1908...	246,960,968	263,368,952	16,637,654	280,006,606
1909...	242,603,584	259,922,366	1,589,793	261,512,159
1910...	279,247,551	298,763,993	2,594,536	301,358,529
1911...	274,316,553	290,000,210	7,196,155	297,196,365
1912...	290,223,857	307,716,151	7,601,099	315,317,250
1913...	355,754,600	377,068,355	16,163,702	393,232,057

In the fiscal year 1910 total imports and total exports showed an increase as compared with the preceding year of 26.50 and 15.24 per cent. respectively; in 1911, 20.51 and -1.04; in 1912, 18.44 and 6.09; in 1913, 23.73 and 24.71. In the fiscal year 1910, dutiable imports amounted to \$241,961,556, free imports \$143,873,547, and import duties collected \$61,024,239; in 1911, \$291,818,801, \$170,222,529, and \$73,312,362, respectively; in 1912, \$343,370,082, \$189,916,581, and \$87,576,037; in 1913, \$456,086,187, \$230,518,226, and \$115,063,688.

Principal imports for consumption by classes, in thousands of dollars, in the fiscal years 1911 and 1912, respectively: Metals, minerals, and their manufactures, 123,777 and 171,463; coal, coke, etc., 41,338 and 42,953; cotton and manufactures, 30,983 and 37,952; wool and manufactures, 26,677 and 33,650; wood and manufactures, 20,679 and 28,515; carriages, automobiles, etc., 11,754 and 20,802; sugar, molasses, etc., 18,152 and 20,591; oils, 9228 and 17,205; chemicals, dyes, drugs, etc., 12,596 and 16,511; fruits, 15,314 and 16,452; settlers' effects, 15,145 and 15,934; hides and skins other than fur, 8904 and 13,486; provisions, 7368 and 12,027; breadstuffs, 13,483 and 11,633; rubber, gutta-percha, and manufactures, 8103 and 11,058; leather and manufactures, 6387 and 9602; silk and manufactures, 7431 and 9171; electric apparatus, 5994 and 9105; paper and manufactures, 6352 and 8347; furs and manufactures, 5759 and 7983; tobacco, 5701 and 7283; tea, 6707 and 6844; spirits and wines, 5604 and 6746; books, etc., 5327 and 6511; hats, caps, etc., 4452 and 6035; glass and manufactures,

4100 and 5370. Included above in metals, minerals, and manufactures are: Iron and steel, 96,179 and 138,648; copper, 5193 and 7549; tin, 5420 and 7242; brass, 3539 and 5288.

The following table shows by great classes domestic exports and total exports in the years ended March 31, 1912 and 1913 (a produce of mine; b produce of fisheries; c produce of forest; d animals and their produce; e agricultural products; f manufactures; g miscellaneous articles; h total merchandise; i coin and bullion; j grand total):

	Domestic Exports		Total Exports	
	1912	1913	1912	1913
a	\$41,324,516	\$57,442,516	\$41,510,582	\$57,583,030
b	16,704,678	16,336,721	16,815,192	16,442,822

j	290,223,857	355,754,600	315,317,250	383,232,057

The leading export from Canada is grain. The table below shows for fiscal years domestic exports of wheat, oats, barley, and all grain in thousands of bushels (a) and thousands of dollars (b), and of wheat flour in thousands of barrels (a) and thousands of dollars (b):

	Wheat		Oats	Barley	All Grain	Wheat Flour
	a	b	a	b	a	b
1908	43,655	7,123	53,949	1,963
1909	40,005	3,172	45,563	8,455
1910	49,137	5,256	59,205	1,738
1911	48,148	2,176	53,782	7,991
1912	49,741	3,402	2,045	56,866	3,064
1913	52,609	1,567	1,108	56,761	14,860
1914	45,802	5,432	1,645	53,841	3,049
1915	45,521	2,149	831	49,536	13,855
1916	64,466	3,881	2,062	76,001	2,739
1917	62,591	3,820	1,324	68,428	16,034
1918	93,166	10,479	6,456	110,571	4,478
1919	88,009	5,068	3,852	97,941	19,971

Other important domestic exports in the fiscal years 1912 and 1913, in thousands of dollars: Planks and boards, 19,340 and 20,839; deals, 6013 and 5514; wood blocks for pulp, 5698 and 6806; square timber, 1268 and 1363; shingles, 1481 and 1409; silver, 15,908 and 20,203; gold, 7193 and 11,227; copper, 5646 and 9912; coal, 4338 and 5555; asbestos, 1495 and 2056; dry salted codfish, 4136 and 4302; canned salmon, 3830 and 3484; canned lobsters, 3081 and 3049; hides and skins other than fur, 5114 and 7276; furs, 3842 and 5166; bacon and hams, 7920 and 5674; cheese, 20,889 and 20,697 (the greatest export of cheese was in 1903, \$24,712,943); hay, 6374 and 3950; agricultural implements, 5699 and 6153; wood pulp, 5094 and 5509; fresh apples, 5104 and 4048.

For years ended March 31, the following table shows by principal countries total imports and total exports, in thousands of dollars:

	Imports		Exports	
	1912	1913	1912	1913
United States...	368,145	455,323	120,535	167,110

SHIPPING. Shipping entered and cleared at the ports has been as follows in fiscal years (exclusive of the coasting trade):

	Entered		Cleared	
	Vessels	Tons	Vessels	Tons
Sea-going				
1902.....	15,339	7,603,034	14,967	7,128,454
1903.....	14,278	8,050,516	14,054	7,790,659
1908.....	15,087	10,189,276	14,717	9,301,996
1912.....	16,642	12,768,191	16,224	11,821,414
1913.....	18,087	13,575,193	17,579	12,655,905
On Inland Waters				
1902.....	23,585	7,595,741	23,822	7,698,175
1903.....	30,819	9,107,386	30,575	8,706,482
1908.....	22,322	9,712,052	23,486	10,371,708
1912.....	23,235	14,496,915	24,013	13,886,607
1913.....	30,814	16,147,103	30,754	15,471,582

In the fiscal year 1913, vessels entered with cargo: British, 2504, of 6,300,433 tons register; Canadian, 3150, of 1,536,787 tons; foreign, 4067, of 2,441,991 tons; total, 9721, of 10,279,211 tons;—in ballast: British, 1431 vessels, of 1,433,461 tons register; Canadian, 2520, of 543,509; foreign, 4415, of 1,319,982; total, 8366, of 8,295,982 tons; total with cargo and in ballast, 18,087 vessels, of 13,575,193 tons register.

COMMUNICATIONS. The total length of single-track railway in operation in Canada on June 30, 1912, was 26,727 miles. The total mileage increased from 7194 in 1880 to 13,151 in 1890, 17,657 in 1900, 20,487 in 1905, 24,731 in 1910, 25,400 in 1911, and 26,727 in 1912. In June of the latter year there were in addition 1622 miles in actual operation, but officially regarded as still under construction. Canadian railways have been built largely under different forms of government aid, as land grants, cash subsidies, loans, the issue of debentures, and the guarantee of bonds or interest. Aid has been granted both by the Dominion and provincial governments and by municipalities. The total area of lands granted as subsidies to steam railway companies by the Dominion and provincial governments up to June 30, 1912, was 56,052,055 acres. The Dominion government owns and operates the Prince Edward Island Railway and the Intercolonial Railway, which extends from ocean ports in Nova Scotia and New Brunswick to Montreal. The capital of these two lines on June 30, 1912, was \$103,434,184, and the aid paid to other lines by

the Dominion government up to that date was \$154,075,235 (in addition, the aid granted by provincial governments amounted to \$35,945,515 and by municipalities to \$18,051,324). Also the Dominion government has undertaken the construction of the eastern portion (1805 miles) of the new National Transcontinental Railway from Moncton, N. B., to Winnipeg, Man.; the expenditure on this line up to March 31, 1912, was \$116,533,769.

The western section (1755 miles), from Winnipeg to Prince Rupert, B. C., is under construction by the Grand Trunk Pacific Railway Company. Several branches are in operation and others under construction. Early in 1913 there remained about 450 miles to complete the main line of the National Transcontinental. The following figures relating to Canadian railways are for the fiscal years 1911 and 1912, respectively: Miles in operation, 25,400 and 26,727; gross earnings, \$188,733,494 and \$219,403,753; working expenses, \$131,034,785 and \$150,726,540; net earnings, \$57,698,709 and \$68,677,213. Capital liability in 1912, \$1,588,937,526 (stocks \$770,459,351, funded debt \$818,478,175). Mileage in operation by provinces in 1912: Ontario, 8546; Quebec, 3882; Saskatchewan, 3754; Manitoba, 3520; Alberta, 1897; British Columbia, 1855; New Brunswick, 1545; Nova Scotia, 1357; Prince Edward Island, 269; Yukon Territory, 102; total, 26,727.

The construction programme for the three private lines—the Canadian Pacific, the Grand Trunk Pacific, and the Canadian Northern Railways—for the year amounted to some 2700 miles. The Canadian Pacific had under way extensive double-tracking and a new and shorter line through the Selkirk range of mountains in British Columbia, which involved a five-mile tunnel. On the Grand Trunk Pacific the gap remaining between the main line, which had reached on December 20, a point 1225 miles beyond Winnipeg, and the construction advancing easterly from Prince Rupert on the Pacific, had amounted to less than 125 miles. At the end of 1913 the rail head was approaching Prince George. Trains were operating 360 miles east of Prince Rupert. Operating equipment was being collected and it was expected that May 1, 1914, would witness the driving of the last spike. Of new branches, mostly in the province of Saskatchewan, 100 miles had been opened. The Canadian Northern Railway, which depended on the completion of the Mount Royal Tunnel, which was holed through during the year (see TUNNELS), to reach Montreal, was making progress. In the west end the rail head had advanced beyond Anderson Creek, British Columbia, while Sudbury and Port Arthur line was nearing completion at the end of the year. The Alberta Central was building a line from Red Deer to Rocky Mountain House. The National Transcontinental Railway from Moncton to Winnipeg, which, with the Grand Trunk Pacific, will give a complete Transcontinental route from the terminal on the Atlantic to Prince Rupert on the Pacific, had, at the end of the year, but a few short gaps remaining. One of these was the crossing of the St. Lawrence River by the reconstruction of the Quebec Bridge, which, as discussed elsewhere (see BRIDGES), was in progress.

Railway development in British Columbia was also progressing during the year and in Nova Scotia a contract was awarded for the con-

struction of the Halifax Terminal Railway, a costly development, as it involved, in addition, piers to accommodate thirty ocean steamers.

The total mileage of electric railways computed as single track was 1725 on June 30, 1912.

The telegraph systems include lines owned and operated by the government and by chartered companies (including railway companies). The government service on March 31, 1912, had 8639 miles of line, with 624 offices. The chartered companies, June 30, 1912, had 34,841 miles of line, with 182,541 miles of wire, and 3122 offices. Post offices in 1911, 13,324; in 1912, 13,859.

FINANCE. The Canadian system of public finance includes a consolidated fund to which are credited the revenues and out of which are paid the expenditures properly relating to the fiscal year. There are in addition miscellaneous accounts dealing with loans, debt redemption, railway administration, capital expenditure on public works, and various other subjects. For fiscal years ended March 31 (except 1902, which ended June 30), the expenditure and the revenue of the Dominion government are shown in the table below, in dollars. The several items are indicated as follows: *a* expenditure chargeable to consolidated fund; *b* expenditure chargeable to capital; *c* railway subsidies; *d* other charges; *e* total disbursements; *f* revenue on account of consolidated fund; *g* other revenues; *h* total revenue; *i* difference between receipts and expenditures; *j* sinking funds; *k* net difference between receipts and expenditures, that is, net excess of expenditure (except in 1912, when there was a net excess of receipts).

* Net excess of expenditure. † Net excess of receipts.

Receipts and expenditures on consolidated fund account have been as follows for fiscal years (figures for 1913 subject to revision):

	1911	Receipts 1912	1913
Customs	\$72,965,394	\$85,051,872	\$123,554,913
Excise	16,869,837	19,261,662	21,447,445
Post office	9,146,952	10,492,394	12,051,729
Railways	10,818,834	11,034,166	12,442,203
Miscellaneous ..	7,979,391	10,268,123	9,193,613
Total	117,780,410	136,108,217	168,689,908
	Expenditure	1912	1913
Debt charges ..	\$12,910,698	\$12,706,853	\$13,089,495
Sinking funds ..	1,203,416	1,156,466	1,384,285
Prov. subsidies ..	9,092,472	10,281,045	13,211,800
Civil govt.	4,463,095	4,774,678	5,109,459
Public works ..	8,621,431	10,344,487	13,468,505
Defense	6,868,651	7,580,600	9,114,533
Rev. collection ..	24,951,636	28,256,780	33,006,201
Other	19,662,798	23,060,541	23,675,259
Total	87,774,198	98,161,441	112,059,537
Surplus	30,006,211	37,946,777	56,630,366

The expenditure chargeable to capital account in the fiscal year 1913 is reported at \$32,396,816, and railway subsidies \$4,935,507. The following figures relate to March 31, 1912 and 1913: Total liabilities of the Dominion government, \$508,338,592 and \$483,232,560; total assets, \$168,419,131 and \$168,930,934; net debt, \$339,919,461 and \$314,301,628. The net debt increased from \$237,533,212 in 1890 to \$265,493,807 in 1900, \$336,268,546 in 1910, and \$340,042,052 in 1911.

NAVY. After the establishment of the Naval Service Department in 1910, it was proposed to proceed with the construction of four vessels of the improved *Bristol* class and six torpedo-boat destroyers of the improved *River* class. Tenders for construction were received in May, 1911, but were not acted upon up to the change of government after the general election of September 21, 1911. Subsequently these arrangements were abandoned, and on December 5, 1912, the prime minister, Mr. R. L. Borden, introduced in the Parliament a bill appropriating a sum not exceeding \$35,000,000 for the immediate construction and equipment in the United Kingdom of three battleships or armored cruisers of the most modern and powerful type. The bill, debated in April and May, 1913, failed of enactment. The only existing ships of fighting value are the first-class cruiser *Niobe* (11,000 tons) and the second-class cruiser *Rainbow* (3000 tons). There are 24 small vessels, eight of which fulfill fishing protection duties, three are used on the Great Lakes, two are ice-breakers, four are detailed for lighthouse duty, and the remainder are used in the revenue and surveying services.

ARMY. Every citizen of Canada between the ages of 18 and 60 is liable to military service under the provisions of the Canadian militia act of 1904, but up to 1913 there was no necessity for compulsion, and the system of cadet and volunteer training flourished so that compulsory service was quite unnecessary. The permanent force was the chief means of instruction. Progress was being made with the general scheme of reorganization determined on in the preceding years, and at the end of the year, 1913, the established strength of the Canadian active militia for 1913 was reported as follows: Officers, 5609; non-commissioned officers and men, 68,815; making a total of 74,424, with 17,703 horses. On December 31, 1913, the strength of the permanent corps was: Officers, 238; non-commissioned officers and men, 2783; making a total of 3021.

GOVERNMENT. The executive authority is exercised in the name of the king of Great Britain and Ireland by an appointed governor-general acting through a privy council, or responsible ministry. The Parliament consists of the Senate (87 members nominated for life by the governor-general) and the House of Commons. Members of the House of Commons are elected by popular vote and hold office for five years unless the Parliament is sooner dissolved. The members of the Commons number 221, which will be increased to 231 under the reappointment necessitated by the 1911 census. Representation by provinces: Alberta, 4 senators and 12 commoners; British Columbia, 3 and 11; Manitoba, 4 and 15; New Brunswick, 10 and 11; Nova Scotia, 10 and 16; Ontario, 24 and 82; Prince Edward Island, 4 and 3; Quebec, 24 and 65; Saskatchewan, 4 and 15; Yukon (ter.) one commoner; total, 87 and 231. The

governor-general in 1913 was Prince Arthur, Duke of Connaught and Strathearn (brother of Edward VII.), who assumed office October 13, 1911. The Liberal ministry of Sir Wilfrid Laurier was succeeded October 10, 1911, by a Conservative ministry under the premiership of Robert Laird Borden. It was composed in 1913 as follows: Prime minister, R. L. Borden; minister of trade and commerce, George Eulas Foster; interior, Dr. William James Roche (from October 29, 1912); public works, Robert Rogers (from October 29, 1912); railways and canals, Francis Cochrane; finance, William Thomas White; postmaster-general, Louis Philippe Pelletier; minister of marine and fisheries and of the naval service, John Douglas Hazen; justice, Charles Joseph Doherty; militia and defense, Col. Samuel Hughes; secretary of state, Louis Coderre (from October 29, 1912), also minister of mines (from February 10, 1913); minister of labor, Thomas Wilson Crothers; internal revenue, Wilfrid Bruno Nantel; customs, John Dowsley Reid; agriculture, Martin Burrell; ministers without portfolio, George Halsey Perley, Albert Edward Kemp, and James Alexander Longheed; solicitor-general (not in the cabinet), Arthur Meighen (from June 26, 1913). Leader of the opposition in the Commons, Sir Wilfrid Laurier.

Each of the provinces has an elected legislature and an executive (lieutenant-governor) appointed by the governor-general acting through a responsible ministry. See also articles on the provinces separately.

HISTORY

NAVAL PROPOSALS. The naval proposals submitted to the House of Commons late in 1912 by Mr. Borden called for the construction of three super-dreadnoughts in British shipyards at a cost of \$35,000,000, to be paid by the Dominion. The ships would be placed under the control of the British Admiralty, but might be recalled if Canada should wish to form a separate naval unit. The "loan" of three dreadnoughts was contemplated by the ministry as a matter of expediency rather than of permanent policy. Mr. Borden explicitly stated, "It must be borne in mind that we are not undertaking or beginning a system of regular and periodical contributions. I agree with the resolution of this house in 1909 that the payment of such contributions would not be the most satisfactory solution of the question of defense. But upon the information which I have disclosed to the house, the situation is, in my opinion, sufficiently grave to demand immediate action." The minister of finance, Mr. White, even went further to say, "I am entirely against a policy of regular and periodical contributions and no one has ever proposed or advocated such a policy." Mr. Borden summed up his contention, "I say in the first place that it is not a policy of contributions at all. I say in the second place that it is not a permanent policy." In spite of the ministerial attempt to represent the bill as a matter of the moment, it was regarded by the Liberals as a matter of moment, and the whole imperial and naval policy was brought into discussion. On the one hand, Mr. Borden insisted on the imperial idea, "If we are to remain an empire we cannot have five foreign

policies and five separate navies." He seemed to believe the empire in grave danger and the necessity for defense most pressing. The Dominion of Canada, after enjoying without expense the protection of the British navy for many years, was morally bound to assist in the defense of the empire. Defense could be best promoted by means of the well-established and efficient British navy, rather than by the inefficient and inharmonious efforts of the Dominion. As far as foreign policy was concerned, the colonies must be at one with the mother-country; harmony and unanimity would be secured, for the present, at least, by the assistance of a Canadian minister at the deliberations of the imperial committee of defense. As a concession to the shipping interests, smaller vessels were to be built in Canada, but Canadian shipyards were at present unfitted for the construction of super-dreadnoughts. On the other hand, Sir Wilfrid Laurier voiced the sentiments of the Liberal opposition. He denied that the integrity of the empire depended on naval unity, "The Crown is a purely sentimental bond, but that bond, though purely sentimental, has proven itself stronger than armies and navies." Naval contribution—even the temporary condition advocated by Mr. Borden—was denounced as "tribute" by the Liberals; subserviency in naval matters would destroy Canadian autonomy, would drag the Dominion into every purely European war of the United Kingdom, and reestablish the domination of the Dominion by "Downing Street." "If we pass this bill," Sir Wilfrid warned the Parliament, "we will certainly interrupt and perhaps put an end to the spirit of self-confidence and self-reliance which has made Canada what it is to-day." The Liberals did not wish Canada to shirk her obvious duty: they were willing to spend even more than was proposed and to construct 2 dreadnoughts, 6 light cruisers, 12 destroyers, and 6 submarines, to be divided between an Atlantic and a Pacific unit, but to be constructed in Canada, manned by Canadians, maintained by the Dominion treasury, and directed by the Dominion government. "If the young nations of the empire take hold of the equipment and manning of ships to look after the distant seas, concentration can easily take place in the waters of Europe, and the British Admiralty knows what zones she has to defend. This is the Australian policy, this would be the Canadian policy," and in the opinion of the Liberal leader, "this ought to be the Canadian policy."

THE CONTEST IN PARLIAMENT. A majority in the lower house were in favor of Mr. Borden's bill, yet for weeks the measure was held up by the minority. The Liberal leaders adopted obstructionist tactics in the committee of the whole, they delivered endless and unnecessary speeches, and under the rules of the house there were no means of closing the discussion. There were at least three ways of dealing with the deadlock: The question of naval policy might be decided by a popular referendum; or the bill might be made an issue in a general election; or the Conservative majority might use the closure to force the bill through. The last was chosen. The Liberals hoped to obstruct the closure resolution introduced by Mr. Borden on April 9, but when Sir Wilfrid Laurier got up to offer an amendment to the government's closure resolution,

Mr. Hazen, minister of marine, was given the floor on a Conservative motion, the "previous question" was moved by him and carried; obstruction was thus ruled out, and the closure was adopted. The closure resolution—or amendment to the house rules—provided that after a measure has been amply discussed, a minister may, on giving 24 hours' notice, introduce a motion to close the debate. If the motion is adopted, members are limited to one speech of 20 minutes, and if at 2 o'clock in the morning succeeding the debate is not concluded, the question shall then be put. Under the new rules, it was possible for the majority to carry the naval bill against the will of the opposition, and on May 15 the House passed the third reading of the naval aid bill by a majority of 38.

The naval aid bill was then referred to the Senate. Just what attitude the Senate would take was uncertain. The Liberals, it will be remembered, possessed a majority of 27 in the Senate. This Liberal majority, however, could not be expected to condemn the bill as resolutely as had the opposition in the Commons; for should the Senate absolutely reject a measure passed by a strong government majority in the lower house, the Commons, it was feared, would ask the imperial Parliament for such amendments to the British North American act as would permit a reorganization of the Senate. The Liberal majority in the Senate was therefore afraid of being reorganized out of existence, yet unwilling to desert Sir Wilfrid Laurier. Sir George Ross, the Liberal leader of the Senate, seemed inclined to compromise, but could not abandon the Liberal position; he rejected the "emergency" excuse, and suggested the appropriation of just enough to carry on the construction from year to year. The government was unyielding, however, and on May 30 the Liberal majority by a vote of 51 to 27 adopted Sir George Ross's amendment that "This House is not justified in giving the consent to this bill until it is submitted to the judgment of the country." It was exactly the same answer as had been given by the Conservative Senate to the Laurier naval proposals some years past. Six days later the federal Parliament was prorogued, but before prorogation Sir Wilfrid Laurier again attacked the government and desired to know what answer would be made to the action of the Senate. Mr. Borden replied that, "Technically, this measure (the naval aid bill) has been rejected by the Parliament of Canada, although, in reality, it has been defeated by a few partisans in the Senate who do not represent in any sense whatever the true desire and wish of the Canadian people." The British government, he went on to say, would probably construct the three ships at its own expense, and if he remained in power he would later obtain authorization from Parliament to pay for the ships. The optimism of the premier was based on his expectation of controlling both houses by 1915. Under the constitutional provision that, in event of a deadlock between the two houses, the ministry may ask the imperial government for leave to appoint six senators, Mr. Borden would have an opportunity to appoint six Conservative senators in addition to those he may appoint on the death of present senators. Moreover, there was a good deal of talk about

redistribution and equal representation. If this should be given effect, nine new seats would probably be assigned to the West. If these new seats were filled by Conservatives, in addition to the six just mentioned, the Conservative minority would be increased to 47 out of a total 102; and as soon as 3 Liberals died, the Conservatives would have a majority. Or, should the government not wish to await that event, there was always the possibility of establishing an elective Senate.

THE BANKING BILL. The regular decennial revision of the banking act and renewal of bank charters, which should have taken place in 1910 had not the Parliament been then overcrowded with work, was taken up by Mr. White, the minister of finance. Frequent demands for closer governmental control of the banking system have been frequent in Canada, and the critics of the present system are able to point to the failure of the Ontario Bank and of the Sovereign Bank, and the mismanagement of the Farmers' Bank. No radical change in the system was incorporated in Mr. White's banking bill, however. The regulations against malpractices were to be made more stringent, the precautions against fraudulent organization were to be increased, more detailed returns and a compulsory annual shareholders' audit were to be required. As a slight step towards the solution of the rural credit problem, banks were authorized to grant loans on farm stock and stored grain as legal security. The banks were also empowered to issue notes, dollar for dollar, on a deposit of gold or of Dominion notes in a central gold reserve under the supervision of a board of trustees.

THE SCHOOLS QUESTION. During a tour through Canada Mr. Herbert Samuel, British postmaster-general, commented on what seemed to him the inadequacy of the school system in Manitoba. Mr. Samuel's remarks were resented in Canada and stirred up a considerable controversy. Sir Redmond Roblin caused quite a sensation by declaring that the remarks of Mr. Samuel were not only based on misinformation, but were grossly impolitic and entirely unwarranted. The dispute was utilized by the Liberals of Manitoba for another attack on the separate (Catholic) schools. It had seemed as if a compromise might be effected on the question of schools in Manitoba—it was proposed to lease private Catholic schools to the board of education with the proviso that although the schools should be under public supervision, no change should be made in their religious status. The anti-clerical authorities, however, would listen to no proposal that allowed the continuance of Catholic schools and instruction by members of the clergy.

In Ontario a considerable but uncertain concession was made to the French. The regulations of a year ago had provided that the French language could not be used as medium of instruction for pupils above the first grade; according to the new circular issued by the department of public instruction, teachers may use French with more advanced pupils who cannot understand English. Moreover, the French language and literature may be studied more than one hour a day. Both of these privileges, however, depend in individual cases upon the consent of the inspector-general.

CANALS

THE NEW YORK STATE BARGE CANAL

LOCK No. 2 AT WATERFORD, THE EASTERN TERMINUS OF THE ERIE CANAL. This is the first of a series of high lift locks located within about a mile and a half, with a combined total lift of 169 feet, the greatest flight of high lift locks in the world. Three locks of the older canal may be seen on the right.

THE TARIFF DEBATE. The lowering of the United States tariff revived the question of reciprocity. The Liberal press demanded the abandonment of duties on food and the establishment of a wide reciprocity in natural products between Canada and the United States. The true commercial interests of Canada, it was asserted, lay in the New World, not in the British Empire. During the year 1912-13 trade with the United States had increased by \$140,000,000, as compared with a \$40,000,000 increase in trade with the United Kingdom. The most powerful consideration was the increased cost of living. Taking advantage of the new tariff arrangements, Canadian farmers and cattle-raisers in the West were selling a large proportion of their grain and beef to American buyers, thereby lessening the supply and increasing the price of food in eastern Canada. The only remedy, said the Liberals, was in the reduction of the Canadian tariff. The tariff campaign was pushed with vigor by Sir Wilfrid Laurier in the fall. In a speech at Hamilton on November 26 he pointed out that according to the statistics of the British board of trade, the cost of living had increased 7 per cent. in Great Britain in the last decade and in Canada 51 per cent.; and although Canada produced yearly ten times more wheat than she consumed, the price of flour in Canada was higher than in Great Britain. The tariff was to blame. Again, in a speech in Montreal on December 9, Sir Wilfrid lamented the prevalence of unemployment. "For the first time since 1896 there is such a thing as unemployment in this country. The mayor of Winnipeg said yesterday, according to press reports, that there were 3000 unemployed in the city of Winnipeg. He also said that three years ago he would have blessed Heaven that there was not a single unemployed person in the city. To-day, as we know, in Montreal, in Toronto, in all the large cities of Canada, men are seeking employment and not finding it." Here again the tariff was to blame. Reciprocity would not only provide the idle with cheap food, it would give them employment by stimulating Canadian industries. On these lines Sir Wilfrid Laurier and his old finance minister, Mr. Fielding, proposed to attack the Borden government in Parliament when the new session should open in 1914.

MISCELLANEOUS. In December the leaders of organized labor in Canada inaugurated a movement to secure representation in Parliament. Labor candidates will contest the next general election in some of the large cities, and if elected will pursue a policy akin to that of the British labor party. During his visit to Canada, the British lord chancellor, Viscount Haldane, delivered an important address before the Association of the American Bar at Montreal. On New Year's day, 1913, was celebrated the completion of the Transcontinental Railway, by which wheat may be shipped direct from Saskatchewan to Port Colborne. Among the many minor projects for promoting imperial solidarity may be mentioned the conclusion of a customs-reciprocity agreement with the British West Indies, the invitation to Australia to adopt a similar arrangement, and numerous schemes for the improvement of cable, postal, and commercial facilities between the British Isles, the British West Indies, and Canada. For the treatment of immigrants

from India, see **INDIA**. For a discussion of the Vancouver coal strike, see **BRITISH COLUMBIA**.

CANADIAN CONSERVATION COMMISSION. See **AGRICULTURE**.

CANADIAN NORTHERN RAILWAY. See **CANADA**.

CANADIAN PACIFIC RAILWAY. See **CANADA**.

CANAL TOLLS, PANAMA. See **PANAMA CANAL**.

CANALS. In comparison with the completion of the Panama Canal there is danger of unduly belittling other important and cognate undertakings under way or under discussion at home and abroad. A system of coastal waterways along the Atlantic was somewhat advanced by government approval in the United States, while the New York State barge canal, notwithstanding its political bearings and associations (see **NEW YORK** under *History*), was nearly completed (as was also the Cape Cod Canal). A project for a new Welland canal was put forth and the canalization of the St. Lawrence River was being undertaken. These and other projects will be outlined in the following paragraphs.

The system of intra-coastal canals proposed for the Atlantic seaboard was discussed during the year by Brigadier-general Bixby, chief of engineers, United States army, in a recommendation made to Congress. This scheme involved the construction of inter-connecting canals so that Cape Cod Bay, Long Island Sound, New York Bay, Delaware River and the long reaches of Chesapeake Bay, Albermarle Sound, and Pamlico Sound, which afford several hundred miles of deep and protected waterway, could be connected by a canal system giving a continuous and protected interior route which not only would have distinct commercial advantages, but possess a certain strategic importance in that it was safe from attack by the ships of a hostile navy.

In 1912 Congress appropriated \$800,000 for a beginning in the construction of the part of the intra-coastal waterway system, between Norfolk and Beaufort, of which \$500,000 was to be expended for the purchase of the Albermarle and Chesapeake Canal, and the remainder was to go towards active construction. The chief of engineers recommended that Congress appropriate \$30,000,000 for the construction of a 12-foot canal between New York and Norfolk, and that the 12-foot canal from Norfolk to Beaufort, already authorized by Congress and under construction, be prosecuted vigorously.

NEW YORK STATE BARGE CANAL. By the end of 1913 the barge canal system was reaching a point where its completion might be predicted within two years and such problems as the type of barges and methods of transportation as well as the development of terminal facilities and various questions dealing with modes of transportation and economy were being discussed seriously.

The State engineer and surveyor of the State of New York, in his report for the year 1913, stated that at the close of the fiscal year ended September 30, the amount of work placed under contract as authorized by chapter 147, laws of 1903, providing for the improvement of the Erie, Oswego, and Champlain canals, was \$78,076,969,

of which there had been performed work to the amount of \$60,983,052, and that, at the same time, there was, under contract, work, authorized by chapter 391, laws of 1909, providing for the improvement of the Cayuga and Seneca Canal, amounting to \$3,780,328, of which there had been completed work to the amount of \$1,815,310; in other words, the improvement of the New York Canal to barge canal dimensions had been placed under contract to the amount of \$82,000,000, and of this about \$63,000,000 had been completed, or 75 per cent. of the work. The total length of the work authorized for improvement by the statutes mentioned approximates 500 miles, and on September 30, 1913, approximately 250 miles had been completed to barge canal dimensions. Most of the principal structures, such as dams and storage reservoirs and locks, were either completed or nearing completion. It was stated at the end of the year that with the next season of navigation the Champlain Barge Canal would be opened for more than one-half of its total length, or from Whitehead southerly to North Cumberland. The Barge Canal work, both completed and in progress, was able to resist the floods of the spring of 1913 with but little damage, and that, for the most part, to the earth embankments of the Champlain Canal, which, it was thought, would require some modifications in order to accommodate future floods of like or similar proportions.

The State engineer in his report discussed the estimated cost of the canal in comparison with the estimates of 1903, which were \$77,572,906, to which should be added \$5,616,088, resulting from changes in the original plan, making a total of \$83,188,994. In 1913 the estimated cost of construction of the Barge Canal was placed at \$86,173,464, and the State engineer estimated that the actual increase over the original estimates due to unforeseen conditions, erroneous estimates, etc., would be in the neighborhood of \$7,000,000. Not only were there contracts in effect for the construction of the canal itself, but for nine Barge Canal terminals; preliminary surveys had been made at a number of points.

LOCK AT KEOKUK DAM. In connection with the Keokuk Dam and water power installation on the Mississippi River at Keokuk, Iowa, there was involved the submersion of the old canal eight miles in length, having its lower end and lock at Keokuk, and which enabled vessels to pass the Des Moines Rapids. In the old canal there were three locks 225 by 78½ feet each, with a depth of 6 feet on the sills and a lift of 8 feet. In connection with the power project the United States government required that a proper lock for navigation should be provided, as well as shop facilities for the equipment of the United States Engineer Corps. The new lock is 400 feet in length between the gates and 110 feet in width, with a depth of 52.135 feet from the top of the wall to the floor. There is 8 feet 14 inches of water over the sill at the upper gates and at the lower gates the corresponding depth is 7 feet and 27.35 feet at low water, respectively, making a lift of about 20 feet at high water and 35 feet at low water, with a maximum lift of 40 feet when low water below the dam occurs with high water above it. The capacity of the lock, when full, is about 2,200,000 cubic feet. The lock was constructed by enclosing the area to

be occupied with a crib cofferdam and then pumping preliminary to excavating the enclosed space. No concrete floor was required as the dam was in solid rock, but the side walls were made of monolithic masses of concrete 608 feet in length with a base width of 33 feet and a height of nearly 60 feet above the foundation. There is a dry bottom with a chamber 430 feet long and 140 feet wide on the floor, and a depth of 19 feet below the top of the wall, and a ship repair plant for the use of the engineer corps in its river work. The hydraulic machinery and gates of the lock and dock present many features of interest, as well as the power plant itself.

WELLAND SHIP CANAL. During the year a substantial start was made with the new Welland Ship Canal connecting Lakes Erie and Ontario, and which was estimated to cost some \$50,000,000. The new canal follows generally the same line as the old canal from Port Colborne on Lake Erie to Allanburg, but from that point Lake Ontario will be reached by an entirely new route. The new waterway was to afford a canal capable of taking boats of as much as 800 feet in length as compared with those of 360 feet for the older canal, which, during the construction, will not be disturbed. In the new Welland Canal, as planned, there will be a small cut off about three miles from Lake Erie, but otherwise the line of the present canal will be followed, and from Welland to the point where the old canal leaves the Welland River the new canal will follow the bed of that stream. From the Welland River to Allanburg the route of the old canal will be followed, but thence to Lake Ontario there will be an entirely new and better alignment. From lake to lake the length of the new canal will be 25 miles, and to overcome the difference in level at low water between the two lakes, 325½ feet, seven lift locks, each with a lift of 46½ feet, will be constructed. The locks are to be 800 feet in usable length by 80 feet in width in the clear, with 30 feet of water over the sills. The canal will be 200 feet wide at the bottom and the excavation project will be 25 feet, but capable of deepening to 30 feet, and all permanent structures will be constructed on that basis so that future deepening can be provided by merely dredging out the reaches. During the year the contract for section 1 covering the Lake Ontario entrance and lock No. 1 was let at an aggregate price of \$3,500,000. The contract for section 3, amounting to \$10,000,000 was also awarded and it was expected that the work would be prosecuted vigorously as the appropriations were available.

CAPE COD CANAL. On December 31, 1913, the canal across Cape Cod from Massachusetts Bay to Buzzard's Bay was about 90 per cent. completed, 13,250 cubic yards having been excavated and 2,800,000 cubic yards remaining, and it was expected that it might be opened for minor craft in the following July, and at its full depth of 25 feet at low water some time during the autumn. On August 1, 1913, the engineers reported that there remained but 4,500,000 cubic yards to excavate and that excavation was proceeding at the rate of 400,000 cubic yards per month. The dredges at work, two of which were the largest in the world, were removing material at the rate of over 4000 cubic yards per day each. The four-mile approach in the navigable waters of the United

CANALS

THE NEW YORK STATE BARGE CANAL

1. **SIPHON LOCK AT OSWEGO.** The First Siphon Lock to be built in the United States, and the only lock of this type on the Barge Canal.
2. **HIGH LIFT LOCK AT LITTLE FALLS.** A Lock with a lift of 40½ feet, with a lift type lower gate. The only instance of a lift gate on any Barge Canal lock except the guard locks at the Genesee River crossing.

States in Buzzard's Bay was completed and the massive granite breakwater at the eastern end was finished.

The Cape Cod Canal is eight miles in length, with a depth of 30 feet at high water and a minimum width at the bottom of 100 feet. It is interesting to compare these dimensions, which are greater than those of the original Suez Canal, or the present Manchester Canal in England. There are three passing points where the bottom is 200 feet wide. At the eastern end, the width is 300 feet for nearly a mile and the approach in Buzzard's Bay is 250 feet. The only curve in the channel has a radius of 7640 feet, and otherwise the route is perfectly straight and will be brilliantly lighted, so that ships can go through the canal by night as well as by day. A saving of 70 miles to and from Boston will be effected for vessels as far south as Charleston, and the average delay per round trip per annum of nearly four days for barges and schooners taking the Vineyard route will be eliminated. This Cape Cod Canal can accommodate all craft up to 23 feet depth, which means the entire coasting fleet, with the exception of six vessels. The new waterway had involved the expenditure of about \$12,000,000.

ST. LAWRENCE RIVER IMPROVEMENT. An important development of the year was the St. Lawrence ship canal between Montreal and Quebec. At the close of the season of navigation on the St. Lawrence River in 1912 the ship canal between Quebec and Montreal, a distance of 220 miles, had been half completed at a total cost of \$15,000,000. This had involved the construction of a 30-foot channel for 60.60 miles between Montreal and Cap a la Roche, and the deepening of the Beaujeu and St. Thomas channels below Quebec to a depth of 30 feet at low tide. The plan involves the construction of a 35-foot channel and during the year considerable of this has been excavated. The completed channel had a minimum width of 450 feet in the straight portions, and from 500 to 800 feet on the curves, so that there was little difficulty in the navigation of the river.

FRANCE. The improvement of the internal waterway system of France continued and new proposals were agitated during the year, one of which involved the expenditure of \$90,000,000 to improve the entire system. The success of this was considered very doubtful in view of the financial condition of the republic. An important improvement was in progress on the Canal du Nord, which shortens the distance from Dunkirk to Paris by 26 miles, and avoids 24 locks by doing away with the detour through St. Quentin. This new canal had a length of 60 miles, a bottom width of 33 feet, and a depth of 5 feet, and its estimated cost was about \$12,000,000. Its completion was expected in 1917. See DOCKS AND HARBORS.

KAISER WILHELM CANAL. The most important project in Europe during 1913 was the practical completion of the new enlarged Kaiser Wilhelm Canal, which connects the German naval ports of the North Sea with those on the Baltic, and eliminates the passage around Denmark. This work had progressed to a point where the opening in April, 1914, in the presence of the Kaiser, could be announced, which was a year earlier than was expected. The enlargement of the Kiel Canal was rendered neces-

sary by the growth of modern warships. The bottom width was increased from 40 feet to 140 feet, the surface being 330 feet; the depth to 36 feet; the curves reduced to a minimum radius of 5800 feet; while the passing places were increased from seven to eleven. This widening involved the construction of new double locks at both ends, the dimensions of which are 1140 feet in length by 148 feet, with a depth of 46 feet, so that the greatest draught whose construction is contemplated, could be passed through the canal readily. The canal was six years in course of construction, and the cost was \$55,000,000.

CANARY ISLANDS. A group of islands off the northwest coast of Africa; a province of Spain. Area, 2808 square miles; *de facto* population (census of December 31, 1910), 444,016 (Gran Canaria 162,601, Palma 45,782, Tenerife 180,327). Santa Cruz de Tenerife, the capital, had 63,004 inhabitants (communal population); Las Palmas, 62,886.

CANCER. The latest proposal in 1913 in the way of a test for the early recognition of cancer was that of Abderhalden. This test was based on the observation that when foreign proteins enter the blood, the body reacts by manufacturing a ferment which causes their disintegration. The method is simple: A small portion of cancerous tissue is put into a dialyzing-sack and covered with the serum withdrawn from the individual suspected of having cancer. The sack is then immersed in a 2 per cent. solution of sodium fluoride and the whole kept at temperature of 71.6° F. for thirty-six hours. At the end of this period the fluid outside of the dialyzer is tested for the products of protein digestion. If peptones are found the test is regarded as positive and the patient is considered to have cancer. As to practical results of this test, Erpicum tried the serum of forty-two patients with tumors, the nature of which was determined later, after operation. Two of these tumors proved to be cancer, and gave positive results.

Following the reports of experiments with solutions of the heavy metals in the cure of mouse cancer, noted in the YEAR BOOK for 1912, a solution of colloidal copper was used in human cancer by Loeb in this country with, according to his report, very encouraging results. Other clinicians, however, failed to obtain any real therapeutic effects. Richard Weil, of New York, summarizes the experience of surgeons at the General Memorial Hospital in New York as follows: The preparation described by Loeb as colloidal copper has been administered in twelve cases of malignant disease, in eight of which the treatment was thoroughly carried out. The treatment resulted, in most of the cases, in the production of mild constitutional disturbances, such as fever, chills, nausea; some loss in weight, a slight reduction of hemoglobin and occasional albuminuria or hemoglobinuria. Chemical analysis of two tumors removed from treated patients failed to reveal the presence of copper, while in a liver obtained at necropsy it was present in appreciable quantity. Judged by certain clinical criteria, which have been adopted as a reliable standard of therapeutic effectiveness the treatment has not appeared to exert a destructive action on the tumor tissue in any of the cases. Since the colloidal salts were stated to have a special affinity for cancer tissue, it is significant that *post mortem* exam-

ination of tumors treated with this agent did did not reveal the presence of copper.

The American Society for the Control of Cancer, consisting of both laymen and physicians, was organized, with George C. Clark of New York, as president; Thomas M. Debevoise of New York secretary; Dr. Clement Cleveland of New York, chairman of the executive committee. With the belief that the control of cancer was simply a problem of education, the activities of the society were to be directed toward teaching the public the facts concerning this disease, to urge early recognition and prompt treatment according to the accepted standards of the day, and to discourage the publication in the lay press of misleading and untruthful articles concerning new and untried cures.

That cancer was increasing seemed to be a well founded belief. The statement that cancer has increased in recent years is perhaps a commonplace, but the extent of the increase is not generally realized. Under existing conditions one in seven women and one in eleven men die of cancer. In a pamphlet just issued by the Society for the Prevention and Relief of Cancer, there was given a number of instructive statistics. In the decade 1851-1860 the annual average of deaths from cancer in England and Wales was 6020. From 1881-1890 the average was 16,192; from 1901-1910, 30,914. This appalling rise in mortality had been continuous during the sixty years, and it was still going on. Allowing for increase of population, the deaths from cancer were now 5.9 per cent. of the total mortality from all causes. In 1851 the percentage was 1.4. During the thirty years, 1880-1910, the cancer death-rate for the United Kingdom had exactly doubled. Cancer was overtaking consumption as a cause of death. Fifty-five years earlier, for every hundred deaths from consumption there were sixteen from cancer; at the time the report was prepared the percentage was six times as great. Other statistics showed a constantly increasing proportion of deaths from cancer, the mortality in 1910 being five thousand more than in 1907. The increase with advancing age is marked. The increase in the mortality per ten thousand is as follows: 1907, 6.57; 1908, 6.60; 1910, 7.04; and 1911, 7.28. The proportion among men rose from 6.03 in 1907 to 6.64 in 1911, and among women from 6.57 to 7.28. Among the unmarried in 1911 there were only 1.09 deaths from cancer per ten thousand living, while among the married the figure was 12.29; among the divorced, 24.09, and among the widowed, 41.79.

The relation of nutrition to transmissible tumors in animals was the subject of some interesting studies by Sweet, Corson-White, and Saxon, who based their experiments on those of Osborne and Mendel, who showed that it is possible to control and limit the growth of animals by appropriate diet. The latter were able by special diet to maintain young rats for long periods without any increase in size, the animals remaining otherwise healthy. Sweet and his colleagues inoculated stunted rats and normally fed rats with transplantable tumors, with surprising results. The number of successful transplantations was remarkably reduced by a stunting diet, and the rate of growth of the tumors successfully inoculated was much slower than in animals nourished with ordinary food. Furthermore, such tumors were more apt to undergo retrogression on a stunting diet.

The experimental demonstrations clearly indicate the possibility of influencing transplantable tumors by selective diet. See AUTOSEOTHERAPY; RADIUM.

CAPE COD CANAL. See CANALS.

CAPE COLONY. See CAPE OF GOOD HOPE PROVINCE.

CAPE OF GOOD HOPE PROVINCE. One of the four original provinces of the Union of South Africa (q.v.). Europeans constitute (census of 1911) 22.71 per cent. of the total population (2,564,965); colored races, 77.29. About one-fourth of the population is urban. Females number 104 to every 100 males. Average density of population per square mile, 9.26. British subjects by birth formed 98.97 per cent.; 2,479,700 were born in Africa. Dutch church adherents, 479,825; Anglican, 282,619; Presbyterians, 74,005; Congregationalists, 147,378; Methodists, 304,444; Lutherans, 77,860; Baptists, 13,704; Roman Catholics, 35,934; other Christians, 21,919; Jews, 16,744; Mohammedans, 24,189; other sects, 3113; no religion, 1,077,998; unknown, 3564; other, 1669. A total of 1,830,320 (Europeans, 130,299) could neither read nor write; of whom 888,856 (67,646) were males and 941,464 (62,653) were females. Those who could read only, numbered 39,323 (Europeans, 8050)—19,738 (4249) males and 19,585 (3801) females. The agricultural population numbered 524,228 males (72,802 Europeans) and 485,246 females (38,373). Cape Town (the capital) had (1911) 68,738 inhabitants (161,579 with suburbs); Port Elizabeth, 30,949; Kimberley, 29,525. The administrator in 1913 was Sir N. F. de Waal.

COMMUNICATIONS. The Saldanha Bay Line was opened in March and a few months later the George-Oudtshoorn, an important main line connection from between the east and west, which shortened the railway distance from Cape Town to Port Elizabeth from 839 miles to 637. The Butterworth-Indutwa line was opened in July, while three lines, amounting in all to 105 miles, were being built. See SOUTH AFRICA, UNION OF, for area, population, history, etc.

CAPE VERDE ISLANDS. A group of islands off the west African coast, belonging to Portugal. Total area, 1516 square miles; population (1910), 142,552 (4718 white, 87,249 colored, 50,585 negroes). Praia is the capital and a leading port; Porto Grande has the better harbor. Imports (1909), 1,909,634 milreis; exports, 235,894 milreis.

CARINTHIA. See AUSTRIA-HUNGARY.

CARNEGIE, ANDREW. See GIFTS AND BEQUESTS.

CARNEGIE ENDOWMENT FOR INTERNATIONAL PEACE. See ARBITRATION, INTERNATIONAL.

CARNEGIE FOUNDATION. See UNIVERSITIES AND COLLEGES.

CARNEGIE INSTITUTE OF TECHNOLOGY. An institution for technical education founded in Pittsburgh in 1909 by Andrew Carnegie. Previous to 1912 it was known as the Carnegie Technical School. The enrollment for 1912-13 was 2798 students from 39 States, and 13 foreign countries. The officers of instruction and administration number 184. The institute consists of four separate schools,

each with its own faculty, buildings, and student body. These are the School of Applied Science, the School of Applied Design, the School of Applied Industries, and the Margaret Morrison School for Women. The four schools offer night courses in practically the same subjects as are given in the day courses. The endowment for the institution amounts to about \$7,000,000. Mr. Carnegie gave to provide for the buildings, \$4,000,000. The income from all sources for the year ending March 31, 1913, was \$462,250. The students at the institute have the privilege of using the Carnegie Library of Pittsburgh. The director is A. A. Hammerschlag.

CARNEGIE INSTITUTION OF WASHINGTON. A summary is given below of the important work carried on in 1913 in the different departments of research into which the work of this institution is divided. All the departments of research of the institution are now well-defined organizations, each of them independent of and more or less isolated from the others, and each of them devoted to a field which, while in some cases related to, does not encroach upon, the field of others.

DEPARTMENT OF BOTANICAL RESEARCH. Studies of the Salton Sea which have been carried on for several years by this department, were brought together during the year in a volume under the title of *The Salton Sea*. Among other researches carried on by the director of the department, mention may be made of his cultivation of the second and third generations of mutants. Dr. Cannon, a member of the departmental staff, carried on studies of root systems of desert plants and of the problem of treelessness in prairie regions. Dr. Forrest Shreve gave special attention during the year to the factors involved in the transpiration of rain-forest plants and to the effects of mountain slopes and climatic conditions varying with altitudes and with exposures. Dr. Spæhr continued his investigations of the action of light and heat in producing chemical changes in plant organisms. Several collaborators contributed to the work of the department during the year. These include Prof. W. L. Tower, Prof. B. E. Livingston, Prof. H. M. Richards, and Prof. D. S. Johnson.

DEPARTMENT OF EXPERIMENTAL EVOLUTION. In this department many additional contributions to the laws of human inheritance were made during the year. The director divided his time between researches based on breeding experiments carried on at his station and studies of data bearing on human heredity collected under the auspices of the Eugenics Record Office, of which he is also the directing head. The biochemical laboratory, in charge of Dr. Gortner, has attested its importance during the year by the aid rendered in the complex studies essential to further advances in the problems of plant and animal evolution.

DEPARTMENT OF ECONOMICS AND SOCIOLOGY. Substantial progress toward the completion of the several contributions from the twelve divisions of this department to their projected basis for a social and economic history of the United States was made during the year under the direction of Prof. Henry W. Farnam. It is estimated that by the middle of 1914 six of the divisions will be able to present final reports. These are the divisions of population and immigration, in charge of Professor Willcox; mining, in charge of Mr. Parker; transporta-

tion, in charge of Professor Meyer; domestic and foreign commerce, in charge of Professor Johnson; the labor movement, in charge of Professor Commons; and social legislation, in charge of the chairman.

GEOPHYSICAL LABORATORY. Important researches into the effects of pressure in the formation of minerals, in the perfection of adequate appliances for calorimetric measures of minerals, and into the data thus far obtained in volcano studies, were carried on during 1913. During the year forty-seven papers were issued by the staff of the laboratory.

DEPARTMENT OF HISTORICAL RESEARCH. The purposes of this department are to furnish aids, guides, and reports which may give appropriate direction to the writers of monographs and general histories; and to furnish full textual publications of important historical documents. Progress was made in both branches of the department in 1913. Searches were made in various European archives for material relating to American history, and these were very successful.

DEPARTMENT OF MARINE BIOLOGY. This department has its laboratory on Loggerhead Key, Dry Tortugas, Florida, but changing conditions will necessitate a removal in the near future. Studies were made during the year into the problem of the origin of coral reefs. An expedition sailed from San Francisco for Sydney, Australia, on July 23, 1913, and arrived at Tortugas Straits early in September.

DEPARTMENT OF MERIDIAN ASTROMETRY. Mr. Benjamin Boss, son of the former director of the department, Prof. Lewis Boss, who died in 1912, was made acting director in 1913. The chief work of the department in 1913 was concerned with precise determinations of stellar positions at different epochs. These researches have shown that the proper motions of the stars brought to light through these determinations are not of a random character, as was hitherto supposed, but are of a systematic nature dependent in large degree, apparently, on the stage in evolution any individual star has reached, and on the group to which it belongs. These and other studies were carried on at the temporary observatory at San Luis, Argentina. An inclusive catalogue of the precise positions of stars in both hemispheres is being compiled at this laboratory.

NUTRITION LABORATORY. The director of the laboratory made during the year a tour to Europe for the purpose of studying laboratories, hospitals, etc. Many valuable suggestive results were obtained from his investigations.

DEPARTMENT OF TERRESTRIAL MAGNETISM. One of the noteworthy events of this department during the year was the completion of the second cruise of the non-magnetic ship *Carnegie*. The aggregate distance covered in the two cruises was in round numbers 160,000 miles. Accurate magnetic data have been obtained of all oceans between the parallels of fifty degrees north and fifty degrees south latitude. Magnetic surveys of land areas also proceeded at a favorable rate during the year. These included surveys in the Desert of Sahara, in Canada, and in South America.

SOLAR OBSERVATORY. Additional equipment and the application of appropriate methods of research have in recent years made the work of this observatory at Mount Wilson increasingly productive. For the most important results, see **ASTRONOMY**.

GRANTS to different departments made during the year amounted to \$751,259. Of these, the largest grant, \$210,263, was made to the department of terrestrial magnetism. Minor grants for carrying on other investigations amounted to \$111,692. For publication there was authorized during the year an expenditure of \$66,693. There was also authorization for the publication of twenty-five volumes during the year. Two hundred and fifty-nine volumes, embracing a total of 67,000 pages of printed matter, have been thus far issued by the institution. The president is Robert S. Woodward.

CARNIOLA. See AUSTRIA-HUNGARY.

CAROLINE ISLANDS. A group of islands lying north of New Guinea and forming part of the German New Guinea Protectorate. The main islands have an aggregate area of 307 sq. miles and a population (1911) of 55,000, mainly Micronesians. The islands were ceded to Germany by Spain in 1899 in consideration of the sum of 16,750,000 marks.

CARRANZA, VENUSTIANO. See MEXICO, *History*.

CARRINGTON, SIR FREDERICK. An English major-general, died March 22, 1913. He was born in 1844. He entered the army, and in 1875 he commanded a body of mounted infantry in the expedition to Griqualand West for the purpose of quelling a rebellion. In 1877 he fought the rebellious Kaffirs, and so achieved distinction. He commanded the Transvaal Volunteer Force in 1878, and later a force in Basutoland which worsted the Basutos. Made colonel in 1884, he took part in several expeditions in South Africa, and organized the Bechuanaland Border Police of which he held command until 1888. He then organized and commanded native levies in Zululand; and he took part in the Matabele War of 1893. On his promotion to the rank of major-general in 1895 he was given command of the infantry at Gibraltar, and served here until 1899. During that time he did special service in South Africa, suppressing a rebellion in Rhodesia. In recognition of these services he was made K. C. D. In the Boer War, with a temporary rank of lieutenant-general, he led an expedition which marched from the East Coast through southern Rhodesia and entered the Transvaal soon after the main army, under Lord Roberts, had captured Pretoria.

CARRINGTON, SIR JOHN WORRELL. A British public official, died February 7, 1913. He was born in Barbadoes in 1847, and educated in that country and at Lincoln College, Oxford. Admitted to the bar in 1872, he returned to Barbadoes and held many offices under the government. He was solicitor-general in 1876, member of the Legislative Council from 1878 to 1881, acting attorney-general in 1880 and 1881, and in 1882 chief justice at St. Lucia and Tobago. From 1883-85 he administered the government of the latter island. In 1886 he was appointed attorney-general of British Guiana, and from 1896 to 1902 was chief justice of the Supreme Court at Hongkong, China. In the latter year he retired on a pension.

CARSON, SIR EDWARD. See GREAT BRITAIN, *Home Rule Bill and War or Conference*.

CARTHAGE. See ARBITRATION, *INTERNATIONAL*.

CASEY, SILAS. Rear-admiral of the United

States navy, retired, died August 14, 1913. Born in East Greenwich, R. I., in 1841, he graduated from the United States Naval Academy in 1860, and served from 1860-62 on the *Niagara*, and in 1862-3 with the South Atlantic blockading squadron. He participated in the first attack on Charlestown under Admiral Dupont, and in the attack on Fort Fisher in 1864. After the war, he was on duty at the Naval Academy from 1867-69. He was made commodore in 1874, and in the same year commanded the Navy Yard at Philadelphia. He was in command at other navy yards and on sea duty until 1901, when he was appointed commander-in-chief of the Pacific fleet. He served in this office until 1903, when he was retired. He was appointed rear-admiral in 1899.

CAT-AND-MOUSE ACT. See GREAT BRITAIN, *Politics and Government*; and WOMAN SUFFRAGE.

CATHOLIC UNIVERSITY OF AMERICA. An institution of higher learning founded at Washington, D. C., in 1887. The total number of students in 1912-13 was 1037. There were 74 professors and instructors. The total value of the property of the university in 1913 was \$2,682,600. There is connected with the university a teachers' college which was opened in 1911. The library contains about 100,000 volumes. The rector is Rt. Rev. Thomas J. Shanahan.

CATSKILL AQUEDUCT. See AQUEDUCTS.

CATTLE. See DAIRYING and STOCK-RAISING.

CAVALRY. See MILITARY PROGRESS.

CAYENNE. See FRENCH GUIANA.

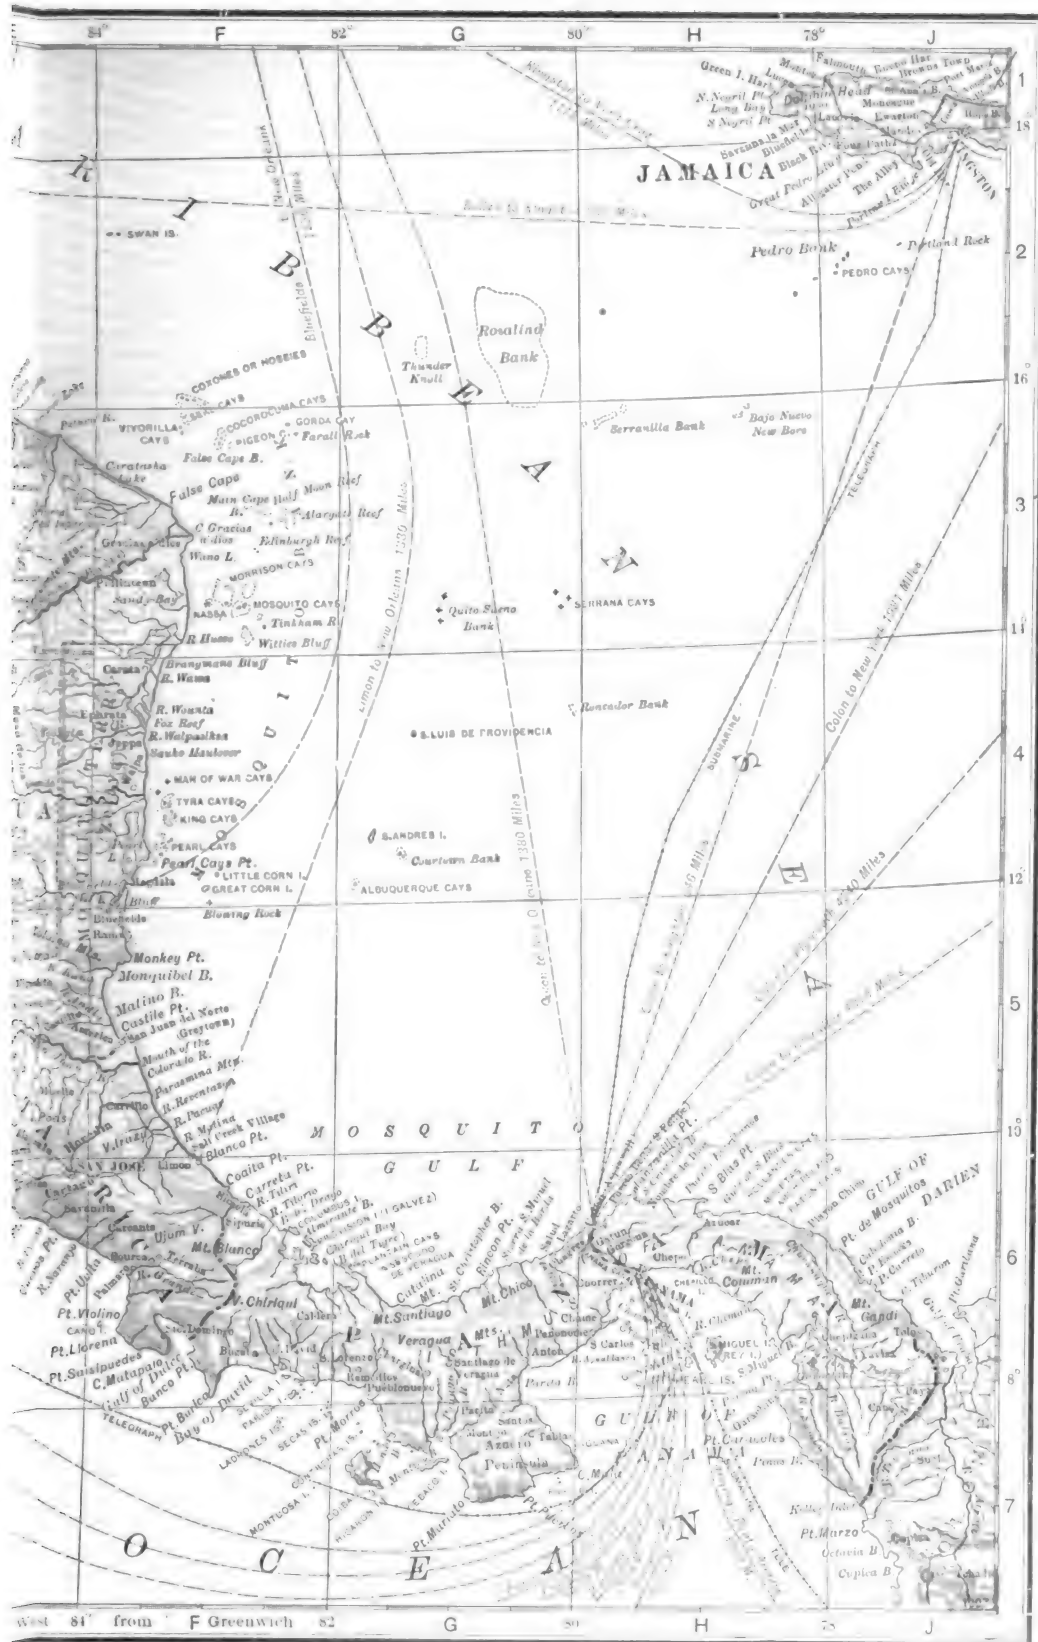

CAYMAN ISLANDS. A group of islands (Grand Cayman, Little Cayman, and Cayman Brac) administratively attached to Jamaica but governed locally by a British commissioner.

CELLULOSE. See CHEMISTRY, *INDUSTRIAL*.

CELTIC PHILOLOGY. See PHILOLOGY, *MODERN*.

CEMENT. The total quantity of Portland, natural, and puzzolan cement produced in the United States in 1912 was 83,351,191 barrels, valued at \$67,461,513, compared with 79,547,958 barrels valued at \$66,705,136 in 1911. Of this quantity, by far the greater amount was Portland cement. Of this cement there were produced in 1912 82,438,096 barrels, valued at \$67,016,928. This represents an increase in production in 1911 of 3,909,450 barrels. Pennsylvania is the leading State in the production of Portland cement. In that State there were produced in 1912 26,491,338 barrels in 23 producing plants. In Indiana the production was 9,924,124 barrels. In California it was 5,974,299; in New York, 4,492,806, and in Missouri, 4,355,741. Other important States are Illinois, New Jersey, Michigan, Iowa, Kansas, Ohio, Washington and Utah. The total number of producing plants was 109 in 1912, compared with 115 in 1911. The approximate consumption of Portland cement in 1912 was 80,865,527 barrels. The average price a barrel for the whole country was 81.3 cents, as compared with 81.4 cents in 1911. The Pacific Coast district is practically the only field of extension of the Portland cement industry at the present time. The exports of Portland cement in 1912 were 404,215,532 barrels, valued at \$6,160,341. There were imported 68,503 barrels. The exports and imports have shown great decrease in recent years. There were 15 plants producing

natural cement in 1912, and the production was 821,231 barrels, valued at \$267,222. The largest production was in New York and Pennsylvania. Considerable quantities were produced in Illinois, Indiana, Ohio, Minnesota, and Kansas. Puzzolan cement was manufactured in 1912 at three plants in the United States, at North Birmingham, Ala., Struther, Ohio, and Sharon, Pa. The total output was 91,864 barrels.

The production of Portland cement in 1913 exceeded that of any previous year, according to the estimates of the U. S. Geological Survey. In the United States 92,406,000 barrels of Portland cement were manufactured, an increase of 12 per cent. over 1912. The shipments in 1913 were 88,853,000 barrels—an increase of 4.5 per cent. The average selling price per barrel was higher in 1912 than in 1913. Of the 11 commercial districts, the five highest with their production in barrels and their per cent. of increase over 1912, were as follows: (1) eastern Pennsylvania and western New Jersey, 27,079,000, 9.4 per cent.; (2) Illinois and north-west Indiana, 12,406,000, 16.4 per cent.; (3) California and Washington, 8,916,000, 21.5 per cent.; (4) Iowa and Missouri, 8,427,000, 11.1 per cent.; (5) Ohio and western Pennsylvania, 7,704,000, 4.7 per cent. A cement which partakes of the natures of both Portland and puzzolan cement was produced in connection with the Los Angeles aqueduct in California. It is made by regrinding Portland cement with volcanic tuff, and is called locally "tufa cement." The output of this cement in 1912 was 205,000 barrels, valued at \$1.50 a barrel.

CENSUS, THIRTEENTH. See UNITED STATES CENSUS BUREAU.

CENTENARIES. See EXPOSITIONS.

CENTRAL AMERICA. See articles on Central American countries.

CEREBRO-SPINAL MENINGITIS. See MENINGITIS.

CEYLON. A British crown colony: an island in the Indian Ocean. Its area is 25,332 square miles and its population (according to corrected figures for the 1911 census) 4,110,367, inclusive of military, shipping, and estates. Colombo is the capital, with 213,396 inhabitants. Government schools are non-sectarian and instruction in the vernacular is free.

Of the total area, about one-fourth is under cultivation; on the tea and other estates there are about 440,000 East Indian coolies, and the same labor is employed on plantations where ice, cocoanuts, grains, rubber, cinnamon, cacao, tobacco, coffee, and cinchona are grown. The pearl banks near Manaar, leased to an English company, have been resumed by the government. The yield of the plumbago mines and pits is estimated at over Rs. 9,484,000. There are 1986 gem quarries.

Tea has long been the staple product of the island; the development of the industry is shown by the following export figures: 1884, 2,392,963 pounds; 1890, 45,799,518 pounds; 1900, 170,183,558 pounds; 1910, 182,070,094 pounds; 1911, 186,594,055 pounds.

The decline in the price of tea has led since 1898 to the more extensive cultivation of rubber in response to the increasing demand. In 1898 only 750 acres were under rubber cultivation; in 1901, 2500; in 1904, 11,000; in 1905, 40,000; in 1906, 100,000; in 1907, 150,000; in 1908, 180,000; in 1911, about 215,000.

The export of cocoanut-palm products was valued in 1911 at Rs. 38,086,242; of cinnamon, Rs. 2,086,293; of cacao, Rs. 2,370,773. From India the colony imports rice (Rs. 45,409,525 in 1911); and from the United Kingdom, coal and textiles. The total value of all imports for the calendar year 1911 amounted to Rs. 164,405,788—Rs. 43,443,786 from the United Kingdom and Rs. 100,095,273 from British colonies. The exports were valued at Rs. 182,028,968—Rs. 87,359,604 to the United Kingdom and Rs. 25,492,338 to British colonies.

The railway lines, as completed to February 1, 1913, were as follows: Colombo-Bandarsawela (160¼ miles), Polgahawela-Kankesan-turai (211¼), Peradeniya Junction to Kandy and Matale (21), Ragama Junction to Mahara Quarry (1¼), Colombo-Matara (98¼), Ragama-Negombo (14¼), Fort Junction to Wharf (1¼)—all broad gauge (5 ft. 6 ins.); Colombo-Yatiantota (47¼), Avisawella-Ratnapura (27), Nanu Oyato Ragalla (19¼)—narrow gauge (2 ft. 6 ins.); 603¾ miles in all, and all government-owned and operated. Under construction are the broad-gauge lines, Madawachchi-Talaimannar (66 miles) nearly completed, Negombo-Chilaw (27), Bandarawella-Badulla (21), and the narrow-gauge Ratnapur-Kahawatte (for Pelmadulla) (17). The Manaar extension will connect the India and the Ceylon systems except for the 20 miles of water plied by the South Indian Railway Company steamers from Dhanuskodi and Talaimanaar. Cost of railway construction to June 30, 1911, Rs. 95,657,026; receipts for year ending June 30, 1911, Rs. 13,583,160; expenditure Rs. 6,337,583.

At the end of the year the railway connection between India and Ceylon, excluding the actual channel crossing, was nearing completion. There was involved the bridging of the Pamban strait and an extension from Madawachchi Junction to the western point of Manaar Island. Ferry steamers will be necessary to connect the two systems, but a survey had been made with a view of utilizing the shoal known as Adam's Bridge for the construction of a railway bridge. The survey for the 22 miles of distance estimated the expense at £833,000. The fulfilment of this plan was rendered more difficult from the fact that the gauges of the lines on either side of the straits were different. In the island proper an extension between Chilau from Negombo northwards was in progress.

An extension of the southwest breakwater, costing £380,000, commenced in December, 1907, was completed in April, 1912. It is 1800 feet long and protects the entrance from the southwest monsoon seas. A water system for Colombo has been completed.

The revenue (derived mainly from customs, and sales, licenses, salt, stamps, and railway receipts) amounted for 1911-12 to Rs. 47,264,222; the expenditure to Rs. 48,643,687. Customs revenue (1911-12), Rs. 12,554,533; from salt sales, Rs. 1,631,381. The public debt stood June 30, 1912, at Rs. 92,073,409. Tonnage entered and cleared (1911-12), 14,926,764 (9,571,159 tons British).

The governor (1913, Col. Sir H. E. McCallum) administers the colony, aided by an executive council of seven members and a legislative council of twenty-one.

CHAMBERLAIN, LEANDER TROWBRIDGE. An American clergyman and author, died May

9, 1913. Born in 1837, and graduated from Yale in 1863, he studied at the Andover Theological Seminary. From 1863-67 he was assistant paymaster in the navy and was also judge advocate for the Pacific Squadron. Previous to that time he had been pastor of several churches in Chicago and Brooklyn. He was at different times president of the Evangelical Alliance of the United States, of the American and foreign Christian Union, and of the New York Colonization Society, and was also vice-chairman of the National Arbitration Commission between Great Britain and the United States. He wrote, among other books: *A Short History of the English Bible*; *The Colonial Policy of the United States*; and *The Suffrage and the Majority Rule*.

CHANNEL TUNNEL. See TUNNELS.

CHAPMAN, HENRY LELAND. An American scholar and educator, died February 24, 1913. He was born in Bethel, Maine, in 1845, and graduated from Bowdoin College in 1866. He studied theology at the Bangor Theological Seminary, graduating in 1869. In 1875 he was appointed professor of English Literature at Bowdoin College, and remained in this position until the time of his death. For two years, beginning in 1883, he was acting president of the college, and from 1887 to 1911 was president of the board of trustees of the Bangor Theological Seminary.

CHARITIES. A striking characteristic of recent years is the growth of charitable and philanthropic activities and the determined effort on the part of those leading such to give them a sounder basis. While relief work of various kinds is inevitable the keynote now being struck is that of prevention. Greater care is being exerted to see that the relief granted does not become a cause for additional demands. There is much scientific inquiry into the causes of poverty, delinquency, and crime, on the principle that only when causes are known can these evils be stamped out. As a result of this closer analysis of conditions demands are being made for advanced legislation to equalize opportunities and realize a larger social justice in industrial and social organizations.

In addition to the material below reference should be made to the following articles: **CHILD LABOR**; **JUVENILE COURTS**; **LABOR**; **LABOR LEGISLATION**; **MINIMUM WAGE**; **OCCUPATIONAL DISEASES**; **PENOLOGY**; **OLD-AGE PENSIONS**; **SOCIAL ECONOMICS**; **WELFARE WORK**; **WOMEN IN INDUSTRY**; and **WORKINGMEN'S INSURANCE**.

NATIONAL CONFERENCE. The National Conference of Charities and Corrections met at Seattle, July 5, 1912, for its 40th annual session. The total attendance of members was about 800. The programme was comprehensive, but throughout the addresses ran the doctrine of "justice not charity" and the demand for far-reaching industrial and social reconstruction to meet the demands of the new sense of "social justice." Another prominent feature was the manifest approval of the idea that social problems must be worked out by governmental rather than social agencies. Thus the burden of crime, poverty, and invalidity is placed upon the whole community, and reliance is placed in the efficiency of regenerated, responsive, and responsible democratic government. Special attention was given to immigration, especially Oriental; to juvenile courts, and

the treatment of unfortunate children in both city and country; to the relation of the churches and of commercial bodies to social work; to probation and parole; and to case work and definite local programmes in the work with families and neighborhoods.

The 1914 meeting will be held at Memphis, Tennessee. The following committees and chairmen were named: Hygiene, Maude E. Miner; children, Mrs. Mary V. Clark; standard of living and labor, Charles P. Neill; health, Dr. Richard C. Cabot; public charities, Dr. J. T. Mastin; defectives, including mental hygiene and defective delinquency, Dr. Llewellys Barker; family and community, Eugene T. Lies; neighborhood development, Mary McDowell; correction, Amos W. Butler.

AMERICAN ASSOCIATION OF OFFICIALS OF CHARITY AND CORRECTION. This body was derived from the Association of Poor Law Officers. It held its annual conference at Springfield, Illinois, early in July, with seventy delegates from fifteen States present. Composed very largely of public charity officials, it gave special attention to practical administrative problems. Several speakers urged the advantages of municipal or State farms for youthful and short-term offenders from the viewpoint of the delinquent, the public, and the administrator. The conference was overwhelmingly of the opinion that private charity must, in most places, be supplemented by public relief, and that there was a steady improvement in the efficiency of public administration because of the better training of officials. It was planned to hold the next conference at Memphis immediately after that of the National Conference of Charities and Correction.

CENSUS OF BENEVOLENT INSTITUTIONS. As a part of the Thirteenth Decennial Census there was issued a report on institutions for the care of children, houses for adults, institutions for blind and deaf, and hospitals, sanitariums and dispensaries for the sick. The total number of institutions reported was 5397, with 380,337 inmates or persons under care at the close of the census year. Compared with the previous special census of 1904 there was an increase of 1346 institutions, and moreover day nurseries numbering 166 in 1904 were not included in 1910. Inmates increased 95,975; children received during the year increased 11,186; patients treated in hospitals increased 911,326, and in dispensaries, 827,408. Institutions for adults or adults and children received 109,319 fewer persons in 1910 than in 1904, this decrease being chiefly confined to institutions for the temporary care of destitute men; institutions for blind and deaf received 4471 fewer. The report stated that any explanation of these increases and decreases in numbers must await a more careful study.

The report showed that there were 1152 orphanages and homes for the care of children in the United States; they received during 1910, 82,011 children; had present on December 31, 1910, 107,401; and had placed out during the year, 14,031. Societies for the aid and protection of children numbered 212; in 1910 they placed out 23,794 and had under care 35,279 children. There were 1142 homes for adults or adults and children; they received during the year 788,691 persons and had present on the census day 121,876. The blind and deaf were cared for in 119 institutions with 15,418 in-

mates, 2554 having been received during the year. Hospitals and sanitariums numbered 1886 with 94,374 persons present and 1,975,833 treated during 1910. There were 576 dispensaries which had treated during the year 2,439,059 persons. The increase in number of dispensaries was 420, of which nearly 200 were county dispensaries in Pennsylvania for the treatment of tuberculosis. The number of hospitals and sanitariums also was increased largely by the greater provisions for the care of the tubercular.

An increase in the number of institutions was reported for nearly every State and, in somewhat similar proportions, showing the growth of humanitarian feeling not only in the industrial communities but in the more sparsely settled States. New York led in number with 797, an increase of 200 since 1904; Pennsylvania had 692, an increase of 301; Massachusetts, 359, an increase of 104; Illinois, 324, an increase of 39; Ohio, 311, an increase of 52; and New Jersey, 207, an increase of 58.

CLEVELAND. Early in the year was formed the Cleveland Federation for Charity and Philanthropy, being an alliance of fifty-three social organizations. Its main object was to collect funds for all member societies through one central agency, thus effecting not only great economy of money and the time of officers, but also freeing givers from the repeated demands of many collectors. By an educational campaign the Federation expected to increase the number of donors and the aggregate funds. The economies effected were striking. The cost of collections, including time of officers and commissions to collectors, was formerly about \$50,000. Not only was three-fourths of this saved, but the entire time of officers could be devoted to administration.

CHICAGO. At the suggestion of Professor Charles R. Henderson, president of the United Charities of Chicago, most of the charitable and philanthropic agencies of the city entered into a common agreement to furnish the public with full and accurate information regarding their work and finances. The aggregate amount contributed and expended by these agencies was about \$13,000,000. The plan did not involve a scheme for federated money raising.

CINCINNATI. Similarly in Cincinnati, following the concerted action to deal with the relief problems raised by the spring floods, there was organized a council of social agencies. This was composed of sixty civic and philanthropic bodies seeking to cooperate by an exchange of case records, the avoidance of implication in family relief, the establishment of uniform accounting, the standardizing of solicitation for funds, and the carrying on of surveys and investigations.

LOS ANGELES. This was the first city in America to create a municipal charities commission with authority to certify organizations seeking funds for charity. Such certification is usually done by a business body or the associated charities. Not only will the new commission protect the public from impostors but it will prevent the overlapping and the misdirection of philanthropic undertakings. Complete financial responsibility, including accurate receipting and accounting, is required of every endorsed organization. The commission is itself empowered to receive and distribute funds and to maintain a free employment bureau.

CHATHAM ISLANDS. A dependency of New Zealand (q.v.).

CHAUTAUQUA INSTITUTION. The fortieth annual assembly of the Chautauqua Institution was held at Chautauqua from July 5 to August 24, 1913. While the summer schools were never so heavily attended as in 1913, the general attendance fell off somewhat, chiefly on account of the flood in Ohio and other western States. There were courses in fourteen departments, six of which are included in the ordinary college curricula, and eight of which are given over to specialized forms of professional work. There were fourteen courses in English, thirteen in French, ten in German, four in Latin, and twenty-two in mathematics and sciences. In addition to the courses especially designed for teachers, there were nearly 200 other courses of various kinds, which included English language and literature, modern languages, mathematics and sciences, religious teaching, music, physical education, agriculture, practical arts, etc. The special days observed were national army day, July 12; federation day, August 2; denominational day, August 6; grange day, August 9; recognition day, August 13; closing day, August 24. The officers of the institution in 1912 were John H. Vincent, chancellor; George E. Vincent, president; and Arthur E. Bestor, director.

CHEMISTRY. RADIO-ACTIVE ELEMENTS. Some progress was made during the past year in the systematization of the radio-active elements and their disintegration products, and in locating them in the periodic system. There appears to be a general law that in an α -ray change, when a helium atom is expelled carrying two charges of positive electricity, the element moves two groups to the left in the periodic table, as from the 6th to the 4th group. In every β -ray change, when a single charge of negative electricity is expelled, the element moves one group to the right, as from the 4th to the 5th group, and this is also the case in the two rayless changes. It seems to follow from this, that it is possible for more than one element to occupy the same place in the periodic table, and Soddy, who has been one of the principal workers along this line, holds that this is in fact the case, and that certain elements with different atomic weights are chemically identical. Thus work by Fleck seems to show the chemical identity of uranium-X and radio-thorium with thorium, of meso-thorium with actinium, of radium-A with polonium, of radium-C, thorium-C, actinium-C and radium-E with bismuth, of radium-B, thorium-

B and actinium-B with lead, and of thorium-D and actinium-D with thallium. Some experimental work by Whytlaw-Gray seems to point in the same direction. This work was done on three tubes of niton (radium emanation) which were sealed up by Ramsay four years before. After this length of time the tubes should contain radium-D with equilibrium quantities of radium-E and radium-F, as well as about fifteen per cent of radium-G, the end element of the series. The material in the tubes was found to be metallic in appearance and on treatment with chlorine gave non-volatile chlorides, soluble, but with difficulty, in water. The solution gave chemical tests for lead, as would be the case if radium-G is identical with that metal, but the quantity was nearly twice that corresponding to the amount of radium-G present, so that radium-D must also give chemical reactions similar to those of lead. The idea that the atomic weight of an element is not a mixed quantity, but is the average weight of atoms, similar chemically but varying in weight within narrow limits, is by no means new, but the work of the year 1913 was the first experimental evidence along this line, and it must be noted that this work is confined to elements with atomic weights above 200. (See also CHEMISTRY, INDUSTRIAL, and RADIO-THERAPY.)

COSMIC CHEMISTRY. The idea that many of the elements in the earth's crust are actually present in a free molecular condition but at infinitesimal concentration, is advanced by Wernadski, in a text-book recently published in the Russian language. In almost every portion of the rocks of the earth the spectroscope reveals the presence of many of the elements which are considered very rare, and many of these are also found in minutest traces in the ocean. In many cases at least these elements are not found in stoichiometric compounds, but in solid (in the ocean, liquid) solution. Wernadski speaks of them as being in a "microcosmic mixture." As one possible source of such elementary condition it may be noted that in volcanic extrusions many elements are present in a gaseous condition, and that this condition is a state peculiarly susceptible to the action of electric phenomena, of ultra-violet light, and of radio-active emanations.

In this connection it may be noted that in going over much of his former work on the analysis of meteorites and searching by the most modern methods for the elements present in minute quantities only, Merrill has failed to find the following elements which had previously been reported as present in meteorites, viz., antimony, arsenic, gold, lead, tin, tungsten, uranium and zinc. On the other hand not only was platinum found beyond dispute (in the Perryville meteorite), but also ruthenium and iridium. In two cases vanadium was found, but in no case barium, strontium or zirconium. This last is peculiar, as no reason can be suggested for the absence of these metals.

A paper by Chamberlain offers some new suggestions on cosmic chemistry. All magmatic masses contain considerable quantities of gases, but these gases are very different in composition and proportion from the gases which make up our present atmosphere. Water and carbon dioxide were certainly constituents of the original magma, and as these gases were liberated from the hot magma carbon monoxide and methane

were formed by interaction. Here is one possible source of natural hydrocarbons. In the rock masses of the earth oxygen is found only in combination, but the earth interior is very poor in oxygen and the crust as a whole is suboxidized. Atmospheric oxygen appeared late in the geological history of the earth, and was formed by the decomposition of oxides, especially of water. Later, when plant life had appeared on the earth, the oxygen of the atmosphere was increased by the decomposition of carbon dioxide by plants, the carbon being in considerable part stored up in coal deposits.

FIXATION OF NITROGEN. The problem of the fixation of the nitrogen of the air is one that has attracted much attention in recent years. Now that the rectification of liquid air has been so far perfected that the cost of pure nitrogen from this source is not prohibitive, it is of great industrial importance to determine the most economical method of combining that nitrogen with hydrogen to make ammonia for the fertilizer industry, and with carbon for the manufacture of cyanides. Three methods for the fixation of nitrogen may already be considered successful from an industrial standpoint, viz., combination of nitrogen with oxygen in the electric arc, used in the manufacture of calcium nitrate and nitric acid at Notodden and Sauheim in Norway, combination of nitrogen with calcium carbide to form cyanamide, with subsequent production of ammonia, and the combination of nitrogen directly with hydrogen under pressure, the Haber process of making ammonia. Other methods, however, demand investigation, for the last word in the economic production of nitrogen compounds has by no means been uttered. During the year 1913, Ewan and Napier studied the absorption of nitrogen by a mixture of barium oxide and carbon. The absorption apparently takes place according to one or both of the two reactions,

$$\text{BaO} + 2\text{C} + \text{N}_2 \rightleftharpoons \text{BaCN}_2 + \text{CO}, \text{ and}$$

$$\text{BaO} + 3\text{C} + \text{N}_2 \rightleftharpoons \text{Ba}(\text{CN})_2 + \text{CO}$$

Both of these reactions appear to be reversible and not to be affected by catalytic agents. Even up to 1100° only half the baryta has been converted into nitrogen compound. The difficulty seems to be in the probable formation of a compound, $\text{BaO} \cdot \text{Ba}(\text{CN})_2$, which is not further acted on by nitrogen.

Several chemists have studied the fixation of nitrogen by aluminum. Thus Fichter finds that when aluminum powder is heated to 700°, nitrogen is rapidly absorbed with considerable rise in the temperature, and it is not difficult to obtain a pure nitride of the formula AlN . Even when air is led over heated aluminum some nitride is formed at the same time as the oxide, as is evidenced by the perceptible odor of ammonia given off in moist air, since the nitride readily reacts with water with the formation of ammonia. On heating with alkalis and carbon the nitrogen of aluminum nitride is converted, but not completely, into cyanide nitrogen. According to Wolf, this reaction is seriously affected by impurities in the aluminum, the presence of even small quantities of oxygen being objectionable. Nitrogen is also absorbed by a heated mixture of alumina and carbon, as was first carried out by Serpek. This reaction,

$\text{Al}_2\text{O}_3 + \text{N}_2 + 3\text{C} \rightleftharpoons 2\text{AlN} + 3\text{CO}$, has been studied by Frankel, who finds that when soot is used the reaction begins at 1400°

and is reversible. At 1500° equilibrium is reached when the amount of CO in the gas is 25 to 40 volume per cent., and at 1600° when the CO is 50 to 65 per cent. Above 1500° carbide begins to be formed, and the reaction is strongly influenced by the kind of carbon used. The fixation of nitrogen by boron offers a particularly attractive field of study, for not only does boron have a peculiarly strong affinity for nitrogen, but the compound BN contains a larger proportion of nitrogen than any other solid nitride. From boron nitride may be obtained both ammonia and the cyanides, and the compound itself makes an excellent refractory material for many industrial purposes. According to the work of Stähler and Elbert, 1500° to 1700° is the most favorable temperature for the reaction

but the absorption of nitrogen per gram boron is much larger when in the place of boric oxide, borocalcite is used. No carbide is formed when borocalcite is heated with carbon, even at 1700°, but when nitrogen is led over the heated mass it is rapidly absorbed, boron nitride and also calcium cyanamide being formed. The reaction appears to be

HYDROGEN BORIDES. An account was given in the 1912 YEAR BOOK of two hydrogen borides which had been prepared by Stock, by the action of acids on magnesium boride. These were the first compounds of hydrogen and boron ever isolated, though a few years earlier Ramsay obtained a gas containing hydrogen and boron which seemed to have the formula H_2B_2 , but which was not pure. The two borides of Stock were H_2B_2 and H_2B_4 . In 1913 Stock carried this exceedingly difficult work still further and found no less than ten different compounds of hydrogen and boron, of which four were in amounts too small for determination of their composition, and of two the formulas could be only approximately determined. The other four borides have been isolated in pure condition and carefully studied. The first boride obtained the past year is H_2B_2 , and proves to be decidedly stable, but it is so exceedingly sensitive to the action of water that in the ordinary preparation of these compounds it is completely destroyed, if indeed it is formed at all. On standing, and more rapidly on warming, the boride H_2B_2 is decomposed and H_2B_4 is one of the products of its decomposition. At ordinary temperatures it is a gas, which can be condensed to a liquid boiling at -87°. By liquid air it can be frozen to a solid which melts below -140°. This boride is analogous to ethane, H_2C_2 , which has a boiling point of -90°, so that in this compound the valence of boron must be considered as four. When this boride, H_2B_2 , is warmed it slowly decomposes, giving among other products a clear volatile crystalline solid, which melts sharply at 99.5° and which has the formula H_2B_4 . This is fairly stable, passing largely unchanged through a tube heated to 400° (in vacuo), and is unacted on by water and hardly affected by concentrated nitric acid. It is soluble in carbon bisulfide and in alcohol. The difficulty of obtaining sufficient for study can be realized from the fact that on decomposing one cubic centimeter of H_2B_2 , only half

a milligram of H_2B_4 is formed. Two other solid borides were obtained by Stock, one of which contains hydrogen and boron in the ratio of 4H:5B, and the other of which probably contains 12 atoms of boron, as its molecular weight in benzene is about 142. The quantity of these which could be obtained was too small to establish their formulas.

OSMIUM. A research, quite comparable in its difficulty with that of Stock's work on the hydrogen borides, is that of Ruff on the fluorides of osmium. Fluorine is very difficult to prepare, osmium is very expensive, glass is more or less strongly attacked by the fluorides of osmium, especially if the least trace of water is present, platinum tubes, while not attacked by fluorine, are opaque and it cannot be seen what reactions, if any, are taking place in them, it is impossible to absolutely exclude oxygen, a trace of which contaminates everything with osmium tetroxide, the osmium fluorides themselves are far from stable compounds, and in addition it is by no means easy to analyze compounds containing osmium and fluorine and to determine the state of oxidation of the osmium. In spite of these difficulties to be surmounted, Ruff has isolated three different fluorides of osmium, OsF_4 , which is formed by the direct union of the elements at temperatures below 250°, OsF_6 formed at higher temperatures when the osmium is in excess, and OsF_8 formed when there is an abundance of fluorine. OsF_4 is soluble in water, giving an acid reaction, and appears to be non-volatile; OsF_6 is volatile, boiling at about 202°. At ordinary temperatures it is a solid and attacks glass to such an extent when warmed that it is impossible to determine its melting point, which must lie above 50° and below 120°. In water it is at once hydrolyzed, giving a precipitate of black OsO_2 , and hence it instantly gives any damp or organic object with which it may come in contact a black coating. More remarkable, however, is the compound OsF_8 , for this is the first compound to be made in which a single atom is combined with eight other atoms of the same kind, and is also the first compound in which a valence of eight is beyond dispute. (Undoubtedly the osmium in osmium tetroxide, OsO_4 , is octovalent, though this would not be universally admitted.) Osmium octofluoride is a lemon-yellow crystalline compound, which melts at 34.4° and boils at 47.5°. Organic substances are violently attacked by it, and it dissolves in water to a colorless solution, which smells strongly of osmium tetroxide.

Another important research on osmium is that of Hofmann on the oxidizing properties of osmium tetroxide, and especially its action as a catalytic agent in oxidizing reactions. It has long been known that osmium tetroxide is one of the strongest oxidizing agents in the whole range of chemistry, but that it could be regenerated in the air, though perhaps also known, was certainly not realized. It is a somewhat slow, but very effective carrier of atmospheric oxygen, as is shown by the fact that 200 cubic centimeters of 40 per cent. alcohol were oxidized within three or four hours by the use of 10 milligrams of OsO_4 , the product being chiefly acetic acid. More remarkable is its action in conjunction with potassium chlorate. A paper which comes in contact with osmium tetroxide is immediately covered with a black deposit of OsO_2 in hydrated form. If this paper

is then dipped in a neutral solution of potassium chlorate the black deposit instantly disappears, being oxidized back to the osmium tetroxide. It follows that a solution of potassium chlorate containing a minute quantity of osmium tetroxide is a most powerful oxidizing agent. Thus a mixture of metallic arsenic and potassium chlorate undergoes no reaction, even in the presence of dilute sulphuric acid, but if a trace of osmium tetroxide is added, the temperature instantly rises and in a moment the arsenic is oxidized with a violent reaction to arsenic acid.

Perhaps more remarkable is the observation of Lehmann that osmium dioxide can act as a catalytic reducing agent, especially as a carrier of hydrogen to unsaturated fats. He describes a lecture experiment in which olive oil is warmed with a little osmium tetroxide, which is, of course, reduced at once to the dioxide. If a current of hydrogen is then led into the oil for a short time, on cooling the oil solidifies to a solid fat. Finally Willstätter finds that finely divided metallic osmium can serve instead of the tetroxide as a catalytic agent in oxidizing reactions with organic substances. Osmium is thus far unique as an element whose oxides can act indifferently as carriers of oxygen and of hydrogen, and were it not for the great cost of osmium, it would undoubtedly find many and important applications in the arts. It is, however, possible that, now one element has been found with these properties, search will be stimulated to find others. Ruthenium tetroxide has the same oxidizing properties as the osmium tetroxide, though to a lesser degree, but unfortunately it is even much more costly than osmium.

SEVERAL NEW COMPOUNDS. Of the many new compounds of inorganic chemistry which have been prepared the past year, a few of the more important may be mentioned briefly. When finely divided silver is shaken with fused arsenious bromide, it dissolves and a compound of peculiar type is formed, Ag_3AsBr_3 . That both silver and bromine are directly connected with the arsenic atom is evident from its chemical properties. It would seem that the arsenic possesses strong secondary valence and that it is by means of this that silver is held in the molecule. This corresponds to the fact that arsenious bromide is capable of combining with three molecules of ammonia, also by secondary valence, to form $\text{AsBr}_3 \cdot 3\text{NH}_3$. Hilpert, to whom we are indebted for this investigation, has prepared several other compounds of similar type, in which the silver present corresponds to the ammonia of ammoniates. Possibly some of the subhalides which have been described also belong to the same type, as for example, $\text{AgF} \cdot \text{Ag}$, $\text{CaF}_2 \cdot \text{Ca}$, and $\text{CaCl}_2 \cdot \text{Ca}$. Fluosulphonates, analogous to chloro-sulphonates, as well as the free fluo-sulphonic acid, have been prepared by Traube. Sodium and ammonium fluorides unite directly with sulphur trioxide to form the fluo-sulphonates NaSO_3F and $\text{NH}_4\text{SO}_3\text{F}$, and the acid is so stable that when the ammonium salt is dissolved in fuming sulphuric acid, the free fluo-sulphonic acid distills over.

Olsson has made for the first time crystalline salts containing trivalent tungsten, by the reduction of a hydrochloric acid solution of tungstic acid by tin. The potassium salt has the formula $3\text{KCl} \cdot 2\text{WCl}_3$, and the rubidium, caesium, and thallous salts are similarly consti-

tuted. It is noteworthy that in these salts trivalent tungsten shows the same tendency to the formation of complex salts that is so characteristic of tungsten trioxide. On leading dry ammonia into a concentrated solution of hydrogen peroxide in absolute ether at -10° , D'Ans and Wedig obtain first beautiful clear crystals of ammonium hydroperoxide, $\text{NH}_4\text{O}_2\text{H}$, which were first prepared by Melikoff and Pisarsjewski some years ago. On further addition of ammonia these crystals fuse to a heavy oily layer, which freezes at -40° to a crystalline mass. On washing with ether at a very low temperature these crystals were obtained in a pure condition, and proved to be ammonium peroxide, $(\text{NH}_4)_2\text{O}_2$. The crystals fuse at -2° , but even below this temperature begin to lose ammonia and go over into the hydroperoxide.

METAL-KETALS. What seems to be an entirely new type of compound, the metal-ketyl, is described by Schlenk. These compounds are formed by the action of metallic sodium (or potassium) on certain ketones. In the reaction one atom of the alkali metal is taken up, and a compound formed which contains a trivalent carbon atom, the formula of these compounds being expressed by $\text{K} \cdot \text{OC} \begin{smallmatrix} \diagup \text{CxHy} \\ \diagdown \text{CzHw} \end{smallmatrix}$. There are three possible reactions which can take place under the conditions in which these compounds are formed: (1) in case any hydrogen is attached to the next carbon atom to the carbonyl group, an atom of hydrogen may be given off and an unsaturated compound formed, a reaction generally resulting in a condensation to compounds of higher molecular weight; (2) the alkali metal may be added to the carbonyl group and the compound condensed to a di-molecular compound, as

or, (3) the alkali metal may be added without condensation. This reaction would be

the carbon atom being thus trivalent. This third type of reaction Schlenk has found to be not uncommon, but it generally results in compounds so insoluble that it is impossible to determine the molecular weight. In the case of phenyl-diphenyl ketone, the compound formed, $\text{C}_6\text{H}_5 \cdot \text{C}_6\text{H}_5 \diagup \text{CO} \cdot \text{K}$ was found to be definitely monomolecular, and a solution of this metal-ketyl could be used to precipitate the metal-ketyls of numerous other ketones. Like other compounds containing a trivalent carbon atom, the metal-ketyls are exceedingly reactive, and are extremely sensitive to all oxidizing agents, even to the air. They are also characterized by an intense color.

CARBOHYDRATES. Work on carbohydrates was again taken up by Fischer, and by the conversion of glucose into methyl-pentose he cleared up the constitution of the rhamnoses. (Ordinary rhamnose in a methyl-pentose, derived from a glucosid of quercitrin, buckthorn berries, and some other plants.) Fischer starts from the dibromo-derivative of glucose, which proves to have a bromine atom on each end-carbon atom. One bromine atom he replaces by OCH_3 , thus forming a methyl-glucosid. The other bromine

atom is then replaced by hydrogen, giving a glucosid from which methyl-pentose is easily prepared. This methyl-pentose proves to be identical with isorhamnose. It is interesting that this glucosid of isorhamnose, as well as the methyl-glucosid of glucose from which it is derived, is hydrolyzed by emulsin, so that the substitution of CH_3 for the CH_2OH group does not affect its relation to the enzyme. It had long been known that cellulose could be converted into dextrose, but the yield was small and it could not be said that all the hexose groups in cellulose passed into dextrose on hydrolysis. This proof was furnished by Willstätter, who has succeeded in converting cellulose quantitatively into dextrose, by the action of hydrochloric acid. While ordinary concentrated acid (37.5 per cent.) only disintegrates the cellulose, a stronger acid (40 per cent.) dissolves it with all but complete hydrolysis. The solution is at first optically inactive, but gradually passes over into dextrose. It is probable that some non-reducing sugar is first formed from the cellulose, and is thus an intermediate step in the process. Led by the fact that the action of an enzyme on arbutin is inhibited by the presence of hydroquinone, which is one of the products of the enzyme reaction, Bourquelot was led to suspect that enzymes might have in general a synthetic action. On testing the matter he found that under proper conditions it was possible to synthesize β -methyl-glucosid by ferment action on methyl alcohol in the presence of glucose. A further study of the conditions of this synthetic action of ferments has led to the production of a number of hitherto unknown glucosids, and has opened a new field of investigation.

CAOUTCHOUC. The existence of a ring of eight carbon atoms in ordinary caoutchouc has long been thought probable, but the evidence has been wholly by analogy from physico-chemical methods. It has now been proved by purely chemical methods by Harries, who first regenerates caoutchouc from dichloro-caoutchouc, and then from this regenerated caoutchouc forms the diozonide. This on decomposition gives several compounds, but among them in considerable quantity the already known 1, 5, cyclo-octadione, which contains an eight-carbon ring. Incidentally it appears probable that the union holding the eight-carbon rings in the polymerized molecule of caoutchouc, is different from that usually found in polymers, and cannot be accounted for by the ordinary valence of carbon, since the original material is more or less completely regenerated from its dichloro-derivative, without resolving the components of the polymer.

COLORING MATTERS. The investigation of animal and vegetable coloring matters by Escher and Willstätter has shown that the yellow pigment of the *corpus luteum* is identical with carotene, the unsaturated hydrocarbon of formula $\text{C}_{40}\text{H}_{56}$, which is the coloring matter of carrots, and which has been lately proven by spectroscopic methods to be also the coloring substance of wheat flour (and which is destroyed by bleaching with nitric oxide). Carotene is closely allied to lycopin, the coloring matter of tomatoes, and also to xanthophyll, $\text{C}_{40}\text{H}_{56}\text{O}_2$, a coloring substance in leaves, which the same workers have shown to be identical with lutein, the yellow pigment of the yolks of eggs. The work on the carotene of the *corpus luteum* necessitated the use of the ovaries of 10,000 cat-

tle, which furnished altogether less than half a gram of the pigment.

CHEMISTRY, BUREAU OF. See FOOD AND NUTRITION.

CHEMISTRY, INDUSTRIAL. (See also CHEMISTRY.) The conspicuous feature in the development of industrial chemistry during the year has been the control of the supply of radium, and happily, in the United States, for philanthropic purposes. Encouraging reports were received as to the general progress of chemical arts at home and abroad. The great activities of the chemical experts of the Department of Agriculture, the United States Geological Survey, and the Bureau of Mines, in searching for new sources of raw materials and in efforts to improve processes were conspicuous. This was notably the case in the Department of Agriculture, where it was reported by Dr. Frank K. Cameron that the kelp sea weed banks along the Pacific Coast would furnish for many years an adequate supply of potash. He says: "The preparation of kelp is becoming a prominent industry on the Pacific Coast. There is a factory at Seattle and one near San Francisco, both of which prepare kelp in a number of ways and sell it directly to farmers within a radius of one hundred miles of their respective factories." The persistent search by the chemists of the same department for a new paper stock was equally conspicuous. In Germany great progress was reported in the manufacture of synthetic indigo, and from Russia came information of the rapid development of the chemical industries. Nearly all the supply of sodium bicarbonate was being manufactured in Russia.

ORGANIZATIONS. The American Chemical Society resumed a practice this year, which it had for some years abandoned, of holding two meetings annually, and in 1913 the first of these was held in Milwaukee, Wis., during March 25-27, while the second was held in Rochester, N. Y., during September 9-12. The total membership in this organization was 6673, making it much the largest chemical society in the world. The president during the year, Arthur D. Little, was succeeded by Theodore W. Richards, of Harvard University.

The Willard Gibbs medal of the Chicago section of this society was presented, on May 16, to Dr. Leo H. Baekeland, in recognition of his contributions to industrial chemistry. With the beginning of 1914 the *American Chemical Journal*, founded in 1876, and edited since its inception by Prof. Ira Remsen of the Johns Hopkins University, will be taken over by the American Chemical Society.

The American Institute of Chemical Engineers held its summer meeting in Boston, Mass., during June 25-28, and its annual meeting in New York City, December 10-13. T. B. Wagner, the president during the year, was succeeded by M. C. Whitaker, of Columbia University.

The Society of Chemical Industry held its 32d annual meeting in the Victoria Buildings in Liverpool, England, during July 16-17, 1913, under the presidency of Prof. Marston T. Bogert, of Columbia University, New York. The secretary reported the membership to be 4244, as compared with 4285 last year. Sir William Crookes was chosen president for the ensuing year, and Nottingham, England, as the place of meeting. The Perkin medal for 1913 was given, on January 24, to James Gayley, for distin-

guished service in the field of chemical engineering and metallurgy.

The International Association of Chemical Societies met in Brussels, Belgium, during September 19-23, 1913, under the presidency of Sir William Ramsay. Seventeen societies, representing 14 countries and an aggregate of 19,582 members, participated in the proceedings. Ernest Solvay made an unconditional gift of 250,000 francs to the association, and announcement was made that he proposed to found an international institute of chemistry for which he proffered the sum of 1,000,000 francs. Among the topics discussed were the unifications of abbreviations of titles for scientific journals used in chemical memoirs, and a commission was appointed to consider a, the publication of an *International Journal of Abstracts* in three languages; b, the publication of three editions of an *International Journal of Abstracts*, and c, the publication of an *International Journal*, containing translations into either English, French or German, of original papers appearing in the lesser known languages. Commissions were also appointed to report on inorganic nomenclature, organic nomenclature, and on the unification of physico-chemical symbols. A meeting is to be held in Paris, France, in September, 1914, under the presidency of A. Haller.

NITROGEN. It was reported that the General Electric Company had succeeded in making a lamp that yields a light of remarkable brilliancy. In making this lamp the air was first exhausted, leaving a vacuum; nitrogen was then pumped in until it was equal to the atmospheric pressure. When the lamp was burning, nitrogen gas heated to a very high degree issued from the filament and circulated in the globe, rising and falling like a fountain spray. As it circulated the intense heat was rapidly dissipated, and this made it possible to subject the filament to a much higher temperature than was obtained in a vacuum lamp. The lights were of 5000 candle power each, consuming 2500 watts.

A company in Norway succeeded in producing 98 per cent. nitric acid from the 30 per cent. acid it had been making for use in the manufacture of calcium nitrate. The method of manufacturing the concentrated acid was patented, and the acid had been used in manufacturing explosives. Details of the process were withheld, but the raw materials used were water from the Maane River and atmospheric nitrogen.

METALS. Aluminum. A new branch of the aluminum industry was the manufacture of the powdered metal known as aluminum-bronze powder and used as a paint pigment, in explosives, in lithographing, and in printing. To make the powder, foil made of the metal only 0.01 mm. thick was cut into squares of 2 mm. on a side and rubbed to a powder. Aluminum foil had partly displaced tin foil for wrapping cheese, chocolate candies, tobacco, etc., and was also being used on electrical condensers. The use of metallic aluminum was being extended to constructing tanks, cooking vats, and vessels for brewers, preserve manufacturers, and in industries where heat conduction, noncorrosion, and a nonpoisonous nature are essential. Expansion in the use of extruded forms and tubing had been great; difficulties had been largely surmounted, and they were turned out with high tensile strength and compact structure. The use of aluminum wire as

the conductor in long-distance power-transmission schemes, while not new, was extended, and it was reported that there had been placed on the market a steel-reinforced aluminum cable consisting in all of seven strands. The six outer strands were made of aluminum, and the inner strand was made of steel of high tensile strength. It was claimed for this conductor that it both transmitted the current and had the requisite strength for use in the towers which were rapidly displacing poles in transmission lines.

Experiments made to bring aluminum to a liquid condition so it might be spread when cold over any dry surface had been crowned with success. The composition was applied like paint with a brush and looked, when spread, like a dull silver coating. It was said to be an excellent preventive of rust, to be resistant to heat, elastic, durable, and resistant to atmospheric influences, and to form an excellent substitute for tin in plating. See ALUMINUM.

BARIUM. Until recently barium sulphate served almost exclusively in Germany as raw material for the manufacture of barium oxide, barium hydrate, barium peroxide, and other barium salts. The sulphate was reduced by heating with coal in kilns to the sulphide. From the solutions of the latter barium carbonate was precipitated by the action of carbon dioxide. This carbonate served as the starting point for the preparation of the chloride, the nitrate, the oxide, etc. An important process for the reduction of barium sulphate that promised to simplify materially the manufacture of soluble barium compounds was due to C. A. Beringer, of Charlottenburg. A mixture of barium sulphate (7 parts) and clay (3 parts) was kept for some time at a bright red heat, resulting in the formation of a double silicate of barium and aluminum. This was readily susceptible of decomposition by hydrochloric or nitric acid.

GOLD. In a process for the manufacture of gold leaf recently introduced in England a highly polished aluminum ring about five feet in diameter and five and one-half inches wide was covered with an adhesive substance, such as a solution of gum, and was allowed to dry. The adhesive surface was dusted with metallic powder so that it was covered with a thin layer of base metal. This layer was polished and the ring was rotated slowly with its lower surface in contact with a solution of a nickel salt, the ring being connected with one pole of a battery, while the other pole was immersed in the nickel solution. An electro-deposit of nickel was thus produced on the polished lever of base metal. The nickel deposit was washed and the ring was rotated with its surface in contact with a solution of gold, the electric connections as before, so that the latter metal was plated on the nickel. There were thus four layers on the periphery of the ring, gum, base metal, nickel, and gold, but each layer of metal was so thin that the combination was said to be even thinner than the best gold leaf. To remove the leaf from the aluminum ring a transverse cut was made in the continuous film, and, starting from this cut, the ring was rotated slowly with its lower part immersed in a liquid which dissolved the adhesive substance, when the film fell from it and was received upon a band of paper traveling at the same speed as the periphery of the ring. The film and paper were then cut up and made into books.

URANIUM. There was but slight demand for uranium ores in Europe. The whole output of uranium ore throughout the world seldom reaches sixty tons a year. Efforts were made to make use of uranium in the steel industry for hardening purposes, but without success. Its actual commercial use was for the production of pigments for coloring glass and porcelain, and it was chiefly interesting for its content of radium. According to Dr. Krusch, a regular production of uranium can be had only from Joachimsthal, in Austria. The mines there, in a production of twenty years, have furnished a uranium pitch with an average content of fifty-five per cent. uranium oxide. As the production of the ore has decreased rather than increased, an annual production of only 1.8 grams of radium salts of the highest activity can be counted on. Although the Austrian production of radium salts had reached 3.8 grams, this was possible only because of the considerable accumulated stocks of uranium held over from other years.

VANADIUM. The use of vanadium steel seems to be extending, perhaps more in the United States than in other countries. The best ores offered for sale in Germany come from the United States, but the importations are slight.

RADIUM. There was considerable activity in connection with the sources of radium in the United States during the year. The U. S. Bureau of Mines reported that practically every ton of ore mined during 1912 went abroad, and "as the American deposits are far from being inexhaustible we are rapidly depleting our own reserve and are shipping from the country material of very great value and of unknown possibilities which cannot be replaced." American hospitals and physicians were compelled to purchase from abroad such radium as they needed for experimental purposes. While radium had not been proved to be a specific for any disease, the outlook for its future application to certain diseases not easily treated otherwise was decidedly encouraging. In October announcement was made by the Bureau of Mines that Dr. James Douglas of New York City, and Dr. Howard A. Kelly of Baltimore, Md., had furnished the money for the purchase of twenty-seven claims of mining land in Paradox Valley, Colorado, the greatest radium-bearing ore deposit known to science. A national radium institute has been founded to work these deposits under the supervision of the Bureau of Mines by an entirely new method of extracting the radium, which will reduce its cost materially. None of this precious material will be for sale, but all of it will be used in the cause of humanity. Later a European radium company was organized in London with a capital of \$3,750,000, for the purpose of controlling the supply abroad and of keeping secret the method of separating radium from barium, which it is claimed will cause a monopoly of the element. The London Radium Institute purchased in October 2000 milligrams of radium, nearly one-third of the output for the year, for \$30,000. According to a Russian journal radium ore has been found in large quantities in the Ferghana district of Russian central Asia. See also CHEMISTRY, and RADIO-ACTIVE ELEMENTS.

METALLURGY. Announcement was made that a method had been discovered in Sheffield of producing superior high speed steel by the introduction of cobalt. The new product, it was said, marked a distinct advance on the best

qualities of steel now obtainable for boring and cutting tools. Also from Sheffield came the announcement of the invention by William H. Worrall of a process that renders armorplate capable of resisting projectiles of the highest power. This result was obtained by a process of hardening, largely secured by the welding or bonding of four or six sheets of metal into one plate, instead of molding the plate as a whole in one ingot. The main object is to effect a thorough homogeneous hardness. This, it is said, will permit of ironclads being as efficiently protected with much thinner and lighter plates than is at present the case. The production of ferrochrome in Sweden by reducing African ores in an electric furnace was described as new. Two furnaces are now in operation, using 3-phase, 50-cycle current at a voltage varying between 45 and 60. Four grades of metal are being made, containing 5, 6½, 7½, and 9 per cent. of chromium, and the finished product is in demand. See METALLURGY.

ALLOYS. The properties of German silver were studied by O. F. Hudson, who found that typical microstructures showed that the usual crystalline growth took place on annealing, but it was also observed that the cold-rolled alloy still showed very distinct signs of the original cored structure of the cast material. The "cored" structure was still in evidence after annealing for forty-eight hours at 700° C. After seventy-two hours' annealing at 700° C. the alloy was practically homogeneous, although faint traces of the "cores" were observed even in this sample. The conclusion that the light and dark shading observed on etched surfaces was due to the persistence of the original "cores" of the crystals of the cast alloy was confirmed by experiments with an alloy cast in the laboratory. The alloy was cast in a small strip mold, and the casting, 7/32 inch thick, was rolled, annealed by heating to about 700° C. for a few minutes, and rolled again to give a strip ½ inch thick. Portions of the cold-rolled strip were then annealed for varying lengths of time at a temperature of 720° C., and typical structures of annealed specimens showed the persistence of the "cored" structure. Annealing at 720° C. for six hours was quite insufficient to give uniformity of composition, but after fifteen hours at this temperature the alloy was perfectly homogeneous. With regard to the rolling qualities, annealing for ten minutes, 100 minutes, and ten hours at 800°, 850°, and 900° C. in all cases gave specimens that were found to roll easily and well, and the same result was obtained after annealing for half an hour at 950° C. and 1000° C. All these annealings were carried out in air in an electrically heated tube furnace, and a specimen annealed for two hours in an atmosphere of coal gas at 850° C. also rolled perfectly. It appears that a coarse crystalline structure due to prolonged or drastic annealing was in itself no sign of inferior rolling qualities.

FUEL. Hj. von Porat, a Swedish engineer, had perfected a process for utilizing peat powder as fuel for locomotives. He found that the same results could be had from one and one-half tons of peat powder that one ton of coal would produce. Peat powder could be burned with an admixture of about five per cent. of coal. As to firing with peat powder, the work was much easier than firing with coal, as the powder was forced into the furnace by automatic process.

No change had to be made in the boiler and none in the fire box, except installing the special apparatus. There was no difficulty in bringing the powder from the tender to the fire box, as it passed through a conveyance pipe. Another advantage in using peat powder was that no cold air could get into the fire box and neither smoke nor sparks escape from the smokestack.

CELLULOSE FROM ASPARAGUS. The invention of a process for the recovery of cellulose from asparagus waste from canning factories and from asparagus stalks that mature after the edible crop has been gathered, is due to Prof. Otto Reinke. When soup extracts are manufactured from the boiled freshly washed asparagus pulp, it is an easy task to obtain a pure cellulose mass by a chemical method. The supply of the plant that is allowed to grow after the edible stalks have been removed is greater and, after being cut in small pieces like chopped straw, it is treated with sulphurous acid, or with eight to twelve per cent. lye of soda, in steam-tight vessels at four to six atmospheres for one to three hours. The result is a heavy brown solution of cellulose, the incrusting substance, and of lignin, the albuminous substance, and in addition thoroughly disclosed cellulose in both short and long fibre form, in long drawn cells, and frequently in fine spiral form. According to the cutting by machinery different qualities of cellulose may be manufactured. The result is often a beautiful pure cellulose product, and after the material has been washed and treated with oxidizing and reducing substances, for example, with diluted solutions of permanganate and sulphurous acid, it may be used for bandages, blasting material, paper, tissues, fine felt, cardboard, etc.

CHEAP ALCOHOL. Owing to the increase in the price of gasoline and the threatened further advance, the possibility of using denatured alcohol for automobile power, the United States Department of Agriculture made tests on various materials for the production of denatured alcohol, but the best that was obtained was a cost of not less than thirty-five cents a gallon. This was so much in advance of the current price of gasoline that the advantage of alcohol in efficiency did not cover it. Experiments were made with all sorts of grains, potatoes, and fruits. It was found that potatoes were the best vegetables for producing alcohol, but that, at the current price, corn was less expensive. Experiments were made in using potato culls, but it was found that the supply was limited. The same thing was true of bananas, which were very productive of alcohol, but which would necessitate the manufacture of the alcohol where the bananas grew.

Extensive tests were made by the Bureau of Mines on the relative efficiency of alcohol and gasoline as fuel. It was shown that alcohol can be used in an ordinary gasoline engine if the compression point is raised. The effective pressure for gasoline is ninety pounds to the square inch, and that for alcohol is 180. An interesting announcement concerning the production of industrial alcohol was made by the DuPont Powder Company, which uses a large quantity of alcohol in the manufacture of smokeless powder. This company developed a method of making alcohol from sawdust, reducing the sawdust with acid and then distilling it. It claimed to produce alcohol at from eight to ten cents a gallon.

SYNTHETIC PRODUCTS. The constitution of aniline black was studied by Green of Manchester, who succeeded in making it from aniline by oxidation from the oxygen of the air, using cuprous chloride as a catalyst, thus dispensing with potassium ferrocyanide and sodium chlorate. This discovery, it was expected, would lead to the finding of analogous colors with different bases, produced like aniline black in the fibre.

A successful synthesis of tannin was discovered by Edmund Stiasny of Leeds. This new product, which is called "neradol," is made from tar distillation products, the synthesis being carried out by sulphonating cresylic acid and combining it then with formaldehyde. The white color of the neradol-tanned leather and the brightening and bleaching effect of neradol when used in combination with other tannins (vegetable and chrome) are especially noteworthy. It is probable that this synthetic material may be used in conjunction with both vegetable and chrome tannages, as it considerably hastens the process, and that, contrary to the general effect of quick processes, it improves the quality of the leather at the same time. It was said that it had been already used on a fairly large scale in the German tanning industry.

PAPER. The persistent search for a new material to supply the ever-increasing demand for paper continued to present new substances. Among those mentioned recently was esparto grass, and this material ranked third among the exports from Almeria, which is the centre of the industry in Spain. The paper mills in the vicinity of Edinburgh, Scotland, imported three times as much of this grass, both from Spain and Africa, as they used of rags and wood both combined. From Spanish esparto the yield of paper was fifty-five per cent.; from African about fifty per cent.; and from rags ninety per cent. Sudd, the inexhaustible jungle growth of the upper reaches of the White Nile, which for so long resisted all attempts at complete bleaching, had yielded to the efforts of the chemist, so that a white pulp that could be used for high class paper-making was available. It was anticipated, therefore, that the Sudan might become a great pulp-producing country. From Oregon came the information that pulp made from the lodgepole pine, a small black and hitherto useless variety, was of promising quality and therefore might be used for paper-making, thus creating a new and important industry in the West. Elephant grass from Uganda, Africa, which was formerly burned each season to keep it down, was tested at the Imperial Institute in London, and after treatment in the laboratory was found to yield a pulp of good color, composed of fibres rather longer than those of the esparto grass, and about the same length as those of Lamboo pulp. A fairly good paper was obtained from this source. In the United States, cornstalks, pineapple leaves and pulp, and fibrous plants and grasses from the South continued to be experimented on. Thomas Ingham of Liverpool, England, developed a seaweed product which he named "Algin" and used in the manufacture of noninflammable cinematograph films, and of a paper which is claimed to be water, flame, and germ proof, and odorless. The paper being a nonconductor of heat, is recommended for wrapping perishable

goods for transport, and for lining refrigerators. See also PAPER.

ARTIFICIAL SILK. The demand for artificial silk continued to increase and there was practically no limit to the amount that could be produced by the three different processes in use. The viscose artificial silk sold at wholesale at from \$1.25 to \$1.30 a pound, the cupro-ammonium was somewhat higher, while that made by the Lyonnaise Chardonnet process sold at \$1.40 to \$1.50 a pound. The greatest difficulty militating against the popularity of artificial-silk textiles was the question of the effect of moisture, and where tensile strength and waterproof qualities were essential the use of artificial silk seemed still to fall short of the requirements. Some interesting developments were noticed in the manufacture of velvets of artificial silk. It would seem that a velvet had been produced which presented all the brilliancy and softness of silk velvet. Although the artificial product lacked a certain quality of the real silk, this drawback had been met with an artificial schappe, which, being in short lengths, helped to give the desired real-silk effect.

Two new inventions were brought out in France for the manufacture of artificial silk, one at Rouen and the other at Harfleur, near Havre. The latter, which was being exploited by a French cotton firm, was in the experimental stage. Both of these inventions were based on the use of raw cotton instead of wood pulp, and both claimed to have overcome the difficulty of nonwashing found with the viscose patent. The growth of the use of artificial silk is one of the commercial wonders. From a beginning ten or twelve years ago its consumption had increased, until in the fiscal year 1912-13 it reached some 20,000,000 pounds. In the same period it was estimated that the consumption of real silk in the raw reached 54,000,000 pounds. Artificial silk is now used in the manufacture of sewing and embroidery silks, ribbons, tie, millinery and upholstery silks, curtains, table covers, and rugs. It is also used in combination with real silk for the making of silk shirtings, and is combined further with real silk, wool, and cotton in the manufacture of dress goods. Chardonnet silk is useful for incandescent bodies. It has been found that the cylindrical, continuous, and uniformly thick threads of artificial silk in mantles show a greater facility for the emission of light than the thicker and shorter ones ending in a point.

JUTE SUBSTITUTES. Textilose (see YEAR BOOK for 1912, p. 140) is said to be practically a paper twine coated with mucilage and then drawn through cotton waste, after which it is spun. Commercially textilose appeared to have attracted more expert attention than any other jute substitute yet put forward. Rights for its manufacture were granted by the English patentees to firms in Austria, Belgium, and Spain, in each of which countries plants were said to be in course of erection. Another material called "stranfa," made from straw by an ingenious chemical process, the invention of a German textile expert, was said to be so like jute that only an authority could detect the existence of straw fibre in piece goods made from a mixture of this material and jute. Stranfa was used for making string, cord, and rope, also piece goods and sacking. The process used in its manufacture was tried with other vegetable fibres, such as reed grasses, aloe leaves, etc., and the results

were said to be most satisfactory, resulting in the production of strong and serviceable fibres in every instance.

EXPLOSIVES. Darsonvillite was a new explosive that took its name from its inventor. It was a mixture of lampblack and liquid gas, and derived its force from the liquefaction of gases. The claim was made for it that it was ten times more powerful than dynamite, and it had been successfully employed in quarries near Paris. Haynesite, also named for its inventor, was successfully tested near Washington, D. C., before representatives of the U. S. Bureau of Mines. It was described as being more powerful than dynamite, and as it would not freeze, and had no disagreeable odor, its great value for blasting in coal fields was claimed.

COLOR PHOTOGRAPHY. An improved process invented by Vancamps of Paris, that admits of indefinite duplication of colored photographs, is as follows: It begins with an exposure. This is done by electric light—and three negatives are taken—one through a violet screen, a second through a green, and the third through an orange. These three negatives are exactly superposable, and are in black and white; but the lights and shades are differently placed, the plates having been made by different-colored lights. These negatives furnish three positives in color on gelatin paper. Mr. Vancamps has invented a colored gelatin paper—yellow, red, and blue, the complementary colors to those of the screens. The three positives are blue, red, and yellow. The yellow paper is used with the negative taken through the violet screen, the red with that taken through the green screen, and the blue with the product of the orange screen. These positives are made by placing the paper in contact with the negative and exposing it to electric light. This fixes the colored matter in the gelatin where the negative allows it to pass. Washing removes the color that has not been fixed by the light. Thus there are three positives—blue, yellow, and red, in which each color has its own distribution, the relations of light and shade being different. To obtain the totalized positive print, it is necessary to combine the three colored prints. This is done by detaching the gelatin films from the paper and superposing them exactly on another sheet. The gelatin being very thin, and the colors very transparent, the eye sees each of the prints through the others and the effects melt together.

LITERATURE. Worthy of mention is the publication of an *Industrial Chemistry, A Manual for the Student and Manufacturer*, consisting of forty-three chapters, each of which is written by a specialist on a given subject. The work is edited by Allen Rogers and Alfred B. Aubert.

CHESS. International chess in Europe had an off year in 1913, only two important tournaments being held—those at Budapest and Scheveningen. In the first contest R. Spielmann of Munich was the victor, with Dr. S. Tartakower of Vienna second, and in the other match the laurels went to A. Alechine of St. Petersburg, with D. Janowski of Paris as runner-up. In contrast with the lack of activity in European chess circles was the enthusiasm shown in the United States and Cuba. The second international masters' tournament was held in New York City in January, J. R. Capablanca, the Cuban champion, capturing first place and F. J. Marshall, the United States champion, getting the second prize. In the Havana congress

which followed in February, Marshall turned the tables on the Cuban player by winning first place, Capablanca finishing second. Another international contest was held in New York City in July and August, Capablanca again gaining the chief honors. O. Duras of Prague, Bohemia, was second, and R. T. Black, a Brooklyn player, third. Marshall established a new record for simultaneous play at Pittsburgh, when he met fifty-seven opponents without being defeated. Dr. E. Lasker, the world's champion, and A. K. Rubenstein, the Russian champion, made arrangements to meet in August, 1914, and settle the question of supremacy. An international tournament to be held in Havana in February, 1914, also was arranged. The attempt to renew the college cable matches for the Rice International Trophy was unsuccessful, but a contest will surely take place in 1914. A noteworthy achievement of 1913 was the establishment of the Metropolitan Chess League, which is to take in clubs in New York City and vicinity. The twenty-first intercollegiate tournament was won for the third successive year by Columbia, Harvard finishing second, and Yale third. The Triangular College League matches were won by Pennsylvania, with Cornell second.

CHESTNUT BLIGHT. See BOTANY under *Plant Diseases*.

CHICAGO, UNIVERSITY OF. A university for higher education, founded in Chicago, Ill., in 1892. The number of students enrolled in the autumn quarter of 1913 was 3719. The faculty numbered 337. There were no changes of special moment in the faculty during the year 1912-13. Following are the principal gifts which were received in the university during the year: Martin A. Ryerson, president of the board of trustees, built and equipped as an addition to the Ryerson laboratory which he had formerly given, a new building at the cost of \$191,000; Mr. La Verne W. Noyes gave the university \$300,000 for the erection of a building for women in memory of his wife, Mrs. Ida Noyes. The productive funds of the university amount to about \$18,000,000, and the income from all sources to \$1,617,000. In the library are about 410,000 bound volumes and 200,000 pamphlets. The president is Harry Pratt Judson.

CHILD LABOR CONFERENCE, NATIONAL. The ninth annual conference of the national child labor committee was held at Jacksonville, Fla., in the early spring. Many phases of the child labor problem were discussed, including the following: School support of the child; widows' pensions; family relief by charitable societies finding work for the children; economic waste and inexpediency of child labor; comparison of mill-town and mountain-home advantages for Southern white children; industrial welfare work; child labor as a cause of poverty; child labor and health; evils of the night-messenger service; cooperation of all civic organizations in the support of the child-labor reform movement. Some prevailing opinions were: That greater support of the child by the school would result in a further decrease of parental responsibility and is therefore highly dangerous; that a carefully guarded mothers' pension plan, properly related to minimum wage and workmen's com-

pensation laws, and administered in a spirit of justice rather than charity, may be approved; that families should not be relieved by putting the children to work; that child labor is not an advantage in interstate competition; that child labor is more often a cause than an effect of poverty; and that cooperation of all organizations, including manufacturers' associations, is needed to stamp out the still great amount of child labor.

The INTERNATIONAL CONFERENCE ON CHILD LABOR in September in Switzerland was called by a commission of the International Association of Labor Legislation. The minimum standards there agreed upon include a fourteen-year age limit for industrial establishments; an absolute prohibition for children under twelve and for those not exempt from school attendance; prohibition of all street-trading and employment in hotels and theatres; and medical examination. It was recommended that the age of compulsory school attendance be advanced to fourteen; that an investigation be made of the contract work of Italian children in France and Germany; that minimum-wage boards for home industries be established; that, where the advance of legislation imposes burdens on poor parents, aid be given by state and local authorities by free tuition, midday meals, clothing, and even money.

LEGISLATION. In addition to the information contained in this paragraph the reader should consult the articles on MINIMUM WAGE, PENSIONS FOR MOTHERS, WOMEN IN INDUSTRY, as well as the general article on LABOR LEGISLATION.

During the year 31 States altogether enacted laws affecting the labor of children. These laws were all steps in advance in their respective States and took the form of raising age limits, shortening hours, restricting night work, prohibiting dangerous and immoral trades to children, regulating messenger and other street trades, and prescribing increased education. The Massachusetts legislature authorized the Boston school committee to establish and regulate a free employment office for minors. Attendance upon continuation schools was required under certain conditions in Indiana, Massachusetts, New York, Ohio, and Wisconsin. This was probably the most striking feature of the year's legislation. Such laws are applicable only where continuation schools are maintained. In Indiana the local board may require attendance for 5 hours weekly for children of ages 14 to 16. In Massachusetts illiterate minors, ages 16 to 21, must attend the evening schools during the full term; and the school authorities may require the attendance of children of ages 14 to 16 for 4 hours per week. In New York attendance may be required for similar persons from 4 to 8 hours per week for 36 weeks. In Ohio attendance may be required for 8 hours per week. In all these cases, except, of course, the Massachusetts evening schools, this attendance must be in the day time. In Wisconsin the child labor laws were for the most part repealed, and a general act substituted. The industrial commission is given power to determine reasonable classifications of employment and enforce the general principles laid down in the statute. Pending findings by this commission minors under 21 may not be night

messengers; girls under 18 may not be messengers, and minors under 18 may not work in blast furnaces, docks, emery polishing or buffing, elevators, explosives, matches, mines or quarries, or among dangerous machinery in motion; children under 16 may not work in cracker machinery, laundries, liquor or tobacco manufacture or sale, paints and poisons, printing or drill presses, stamping machines, theatres, and concert halls; no female may be employed where she must remain standing constantly. No child may be employed more than 48 hours a week, including 4 hours at continuation school, nor between 6 P.M. and 7 A.M. Attendance on a continuation school between ages 14 and 16 is required for from 5 hours a week for 6 months to 4 hours a week for 8 months. Various regulations for the issuance of permits for paper boys, boot blacks, and other street traders are included. These general regulations of the Wisconsin law reflect a high standard of modern child labor legislation. See, also, FACTORY INVESTIGATING COMMISSION.

CHILE. A South American republic, on the Pacific coast. The capital is Santiago.

AREA AND POPULATION. The area, in square kilometers, as officially stated, and the population, as calculated for December 31, 1910, with density per square kilometer, are shown below by provinces (in the last column is shown the percentage of cultivated area):

	Sq. km.	Pop.	Dens.	Cult.
Tacna	23,958	42,925	1.8	0.15
Tarapacá	46,957	115,940	2.5
Antofagasta	120,718	118,718	1.0
Atacama	79,585	65,118	0.8	0.26
Caquimbo	34,862	178,731	5.0	1.53
Aconcagua	14,210	132,730	9.0	3.97
Valparaíso	5,059	299,466	60.0	6.98
Santiago	14,672	546,599	37.0	7.31
O'Higgins	6,066	94,257	16.0	13.04
Colchagua	9,987	159,421	16.0	11.37
Curicó	7,714	108,120	14.0	8.23
Talca	9,948	132,730	15.0	6.86
Linares	10,210	111,773	11.0	8.11
Maule	6,410	115,568	17.0	6.33
Nuble	8,823	168,858	19.0	10.71
Concepción	8,422	225,054	24.0	6.14
Arauco	6,366	62,259	10.0	3.28
Bio-Bio	13,587	100,495	7.0	5.24
Malleco	7,701	113,020	16.0	16.03
Cautín	15,105	161,935	10.0	3.90
Valdivia	21,637	131,751	6.0	1.44
Llanquihue	91,676	113,285	1.2	0.61
Chiloé	22,255	91,657	4.0	0.33
Magallanes (ter.) ..	171,438	23,650	0.1	0.01
Total	*757,366	3,415,060	4.5	1.62

* 292,419 square miles.

The population of the larger cities was returned by the 1907 census as follows: Santiago, 332,724; Valparaíso, 162,447; Concepción, 55,330; Iquique, 40,171; Talca, 38,040; Chillán, 34,269; Antofagasta, 32,496; Viña del Mar, 26,262; Curicó, 17,573; Temuco, 16,037; Serena, 15,996; Talcahuano, 15,561; Valdivia, 15,229; Punta Arenas (the southernmost town in the world), 12,199. Marriages as reported for 1911 and 1912 numbered 19,184 and 21,298; births, 133,468 and 135,255; deaths, 107,837 and 104,295; still-births, 3611 and 3592; excess of births, 25,631 and 30,960. Immigration

declined from 6024 in 1908 to 3098 in 1909, 2543 in 1910, and 1711 in 1911.

EDUCATION. Primary instruction is gratuitous, but not compulsory. At the end of 1911 public primary schools numbered 2896, with 4829 teachers, 3,5274 pupils enrolled, and an average attendance of 58.76 per cent. Private schools receiving state aid had an enrollment of 52,315, and those receiving no state assistance had over 30,000 pupils. For secondary and higher instruction there were in 1911 41 lyceums for boys (enrollment 12,052), 36 lyceums for girls (3277), 16 normal schools (3396), a considerable number of special and technical schools, the University of Chile (2002), and the Catholic University (683). The national library contains over 135,000 volumes. The State religion is Roman Catholicism, but religious toleration prevails.

AGRICULTURE. In the year 1911-12 there were under cultivation 1,233,663 hectares, or 1.62 per cent. of the total area of the country. For the percentage by provinces, see the last column of the table in the section *Area and Population*. Of the total cultivated area, 584,264 hectares, or 47.4 per cent. were under cereals. The area under important crops and the yield were as follows in the year 1911-12: Wheat, 444,870 hectares, 6,150,231 metric quintals; barley, 41,876 ha., 707,862 qs.; oats, 27,972 ha., 490,651 qs.; corn, 22,766 ha., 387,774 qs.; kidney beans, 36,559 ha., 454,262 qs.; vetches, 9183 ha., 126,956 qs.; chick peas, 1851 ha., 10,334 qs.; potatoes, 26,672 ha., 2,627,954 qs.; alfalfa, 3,326,691 qs.; tobacco, 1003 ha., 23,031 qs.; vines, 56,781 ha., 19,643,799 decaliters of wine, and 176,334 of spirits. The area under wheat and the production have been as follows: 1907-8, 462,470 ha., 5,162,035 qs.; 1908-9, 447,820 ha., 4,828,822 qs.; 1909-10, 340,898 ha., 5,373,281 qs.; 1910-11, 392,775 ha., 4,960,216 qs.; 1911-12, 444,870 ha., 6,150,231 qs. (13.82 qs. per hectare). The pastoral industry is developing, especially sheep-raising in the south. Livestock in 1912 were as follows: Horses, 380,786; mules, 36,834; asses, 33,492; cattle, 1,760,272; sheep, 4,168,572; cabrios, 273,218; swine, 165,673. The wool production in the year 1911-12 was 92,493 metric quintals, of which 57,035 were credited to Magallanes territory.

MINING. Chile is exceptionally rich in mineral resources, to which its prosperity is largely due. Formerly the country was famous for its copper production; there was a decline, but in recent years the copper output has increased. The copper export in 1911 was 653,687 quintals and in 1912, 823,970 quintals. Large deposits of iron ore exist. Iodine and calcium borate are important products of the northern provinces of Antofagasta and Tarapacá, which are more notable for the production of sodium nitrate. The greater part of Chile's exportation consists of sodium nitrate, amounting to 53,250,327 Spanish quintals (of 46.09 kilos each) in 1911 and 54,199,439 in 1912.

MANUFACTURES. The number of industrial establishments, as officially reported for 1911, was 5722, with a capital of 471,287,333 pesos. These industries employed 74,618 persons (51,524 men, 17,037 women, 6057 children), whose wages in 1911 amounted to 73,064,668 pesos. The raw materials used in 1911 amounted to 300,727,098 pesos, and the annual product 535,037,093 pesos. The princi-

pal industrial centres are Valparaiso and Santiago, the latter having 1131 establishments capitalized at over 138,000,000 pesos.

COMMERCE. In the special trade, imports and exports have been as follows, in thousands of pesos gold:

	1908	1909	1910	1911	1912
Imports...	267,264	262,083	297,486	348,990	334,455
Exports...	319,149	306,430	317,213	330,621	377,105

The leading imports include cotton and woolen goods, iron and steel manufactures, and coal. Principal exports, special trade, in 1911 and 1912 respectively, in thousands of pesos: Sodium nitrate, 262,649 and 292,327; copper, 18,687 and 30,777; wool, 7696 and 8367; calcium borate, 6231 and 6145; iodine, 5140 and 5385; hides and leather, 8983 and 5330; meat, 3769 and 3249; oats, 1590 and 2363; wheat, 1384 and 2124; beans, 1834 and 2124; bran, 1150 and 1286; nuts, 1858 and 1248; barley, 1853 and 1053; flour, 827 and 795; whale oil, 1164 and 766. Exportation by classes in 1911 and 1912: Animal products, 21,010,053 pesos and 20,769,760 pesos; vegetable products, 14,470,375 and 19,835,763; mineral products, 294,474,679 and 336,067,787; beverages, 210,214 and 172,768; specie, 6000 in 1911; miscellaneous, 449,838 and 258,452; total, 330,621,159 and 377,104,530.

Imports and exports by principal countries, in thousands of pesos:

	Imports		Exports	
	1911	1912	1911	1912
U. Kingdom....	111,768	106,751	145,913	150,966

Total, including other...	348,990	334,455	330,621	377,105

COMMUNICATIONS. Railways in operation in 1912, 5945 kilometers, of which 2831 kilometers were government line and 3114 kilometers private line; under construction, 2573 kilometers. State railway in operation at the end of 1912 was reported to have reached a length of 3125 kilometers. Construction continued in 1913, especially on the Longitudinal Railway. The northern, or Pueblo Fondido-Pintados, section of the Longitudinal Railway, 440 miles in length, was completed, while the Santiago-Copiapo line was also opened. In the south the railway was also connected to Puerto Montt. The Chilean Northern Railway opened 154 miles on its line from Pizagua to Lagunas, while progress was made with the Monte Aguila being built through Decheche Pass to connect with the Argentine system. The Arica-La Paz line was opened.

Telegraph wire (1910), 36,024 kilometers, with 352 offices. Four wireless stations are reported, and in addition 9 on board vessels. Post offices, about 1100.

FINANCE. The monetary unit is the peso, worth 36.5 cents. The value of the paper peso is about 22.3 cents. Revenue (including extraordinary revenue) has been as follows: In 1907, 96,586,766 pesos paper and 98,391,310

pesos paper; in 1908, 72,447,363 and 165,409,348; in 1909, 73,729,045 and 145,617,809; in 1910, 82,764,423 and 169,070,342; in 1911, 71,938,379 and 213,214,929. Expenditure for the same years: In 1907, 31,134,446 pesos gold and 180,640,337 pesos paper; in 1908, 39,102,517 and 197,719,009; in 1909, 44,736,791 and 199,209,099; in 1910, 60,677,704 and 234,143,253; in 1911, 60,775,635 and 234,191,707. Reduced to gold value, the foregoing figures are as follows, in thousands of pesos:

	1907	1908	1909	1910	1911
Revenue....	162,531	160,895	160,946	184,028	197,794
Exp'diture...	152,204	139,272	164,052	200,917	199,014

The chief sources of revenue are nitrate export duties, import duties, and state railways. The budget for 1912 showed a total estimated expenditure of 81,070,863 pesos gold and 280,909,113 pesos paper. As reported for 1913, the budget showed estimated expenditure by departments as follows: Interior, 513,400 pesos gold and 37,354,560 pesos paper; foreign affairs, 1,396,697 and 354,416; worship, 2,329,551 paper; colonization, 60,000 and 1,947,680; justice, 10,721,766; public instruction, 391,520 and 37,766,112; finance, 37,809,710 and 15,373,983; war, 497,426 and 35,729,732; marine, 497,426 and 35,729,732; industry and public works, 9,428,371 and 18,095,755; railways, 1,900,500 and 74,068,885; total, 52,732,120 and 257,916,147.

Public debt, December 31, 1912: Foreign, 459,970,133 pesos gold; internal, 5,916,700 gold and 181,203,570 paper.

ARMY. The legislation of 1912 provided for the establishment of an active army, placed its strength at about 800 officers and 17,860 of other ranks, including a permanent organization of 8044 men and 5871 in the navy. The annual contingent of recruits was 9860 for the army and 709 for the navy, the number of recruits actually called to the colors in 1913 being 9000. In addition there was maintained a force of coast artillery of 1500 men, which in 1913 it was decided to turn over to the navy, and a gendarmerie of 1734 men. There were 900 officers on reserve and in active service six major-generals, ten brigadier-generals, 24 colonels, 45 lieutenant-colonels, 90 majors, 200 captains, 250 lieutenants and 165 sub-lieutenants. The army, which is organized in four provinces consisting each of two brigades of infantry, one regiment of artillery, one machine gun detachment, one battalion of engineers, a detachment of train and railway troops, had an effective strength of about 400 men on a peace basis.

NAVY. The navy in 1913 included: Two battleships, aggregating 15,600 tons (*Capitán Prat*, built in 1892, and *O'Higgins*, 1897); one armored cruiser, 7000 tons (*Esmeralda*, 1896); four protected cruisers, 14,500 tons (built between 1890 and 1899); two torpedo cruisers, 1470 tons; seven torpedo-boat destroyers, 2270 tons; five first-class torpedo boats, 728 tons, and several auxiliary vessels, transports, etc. In September, 1911, contracts were let for six destroyers; the first was launched in September, 1912, and ran trials successfully in the summer of 1913. Two dreadnoughts of 28,600 tons each and a main battery of ten 14-inch guns were under construction at Elswick in 1913. The first, the *Almirante Latorre*, was laid down in December, 1911, and the second,

the *Almirante Cochrane*, in January, 1913.

GOVERNMENT. The legislative power is vested in a congress of two houses, the Senate (36 members, elected for six years) and the Chamber of Deputies (118 members, elected for three years). The president is elected by indirect vote for five years and is assisted by a council of State and a responsible ministry. The president in 1913 was Ramón Barros Luco, inaugurated December 23, 1910. Ministry, formed in January, 1913: Premier and minister of the interior, Guillermo Barros; foreign affairs, Enrique Villegas; justice, Anibal Letelier; finance, Manuel Rivas; war, Jorge Matte; industry, Oscar Viel. Ministry formed June 17, 1913: Premier and minister of the interior, Manuel Rivas; foreign affairs, worship and colonization, Enrique Villegas; justice and public instruction, F. Paredes; finance, A. Alessandri; war and marine, J. Matte; industry and public works, Enrique Zañartu. In December a new ministry was formed as follows: Interior, Rafael Orrego; foreign affairs, Enrique Villegas; justice, Enrique Rodríguez; finance, Ricardo Salas Edwards; industry, Enrique Zañartu; war, Ramón Corvalán Melgarejo.

HISTORY. A revision of the foreign policy of the Barros ministry was expected after the dismissal in January of Señores Huneeus and Vicuña, respectively ministers of foreign relations and of war; nevertheless no important innovations were immediately discernible. Later on, when President Ramón Barros Luco delivered his message to Congress on June 1, the government seemed to be concerned primarily with questions of railway construction, water supply, nitrate exploitation, commercial enterprise, and finance. According to the statement of the minister of finance, the four-million-dollar deficit from 1912 was to be carried forward to 1914, when it would be covered by a surplus resulting from new beer and inheritance taxes. In its endeavors to stimulate commerce and industry, the government was very active. The department of foreign affairs established a consulting commercial commission to study commercial treaties and to discover what revisions would be desirable. The first Chilean Congress of Industries and Commerce met in Santiago on October 7. In the nitrate industry the authorities showed themselves anxious to promote nationalization, and the Nitrate Council in November resolved to give preference to Chilean purchasers in the sale of nitrate lands. A bill was introduced in Congress to create a ministry of agriculture. In another field of endeavor, in the creation of adequate supplies of potable water for Chilean cities, the government made considerable advance, building numerous and extensive reservoirs, aqueducts, and dams. No less important was the improvement of the means of communication. It was announced in the spring that in addition to the three wireless stations already in operation on the coast, the government would establish six others. On November 6, the rails of the great Longitudinal Railway from Iquique to Puerto Montt were joined; the line will eventually extend from Peru to the straits of Magellan.

Industrial conditions were characterized by an increasing unrest which culminated in a general strike. The trouble began early in November with the refusal of the shunters and

pointsmen of the state railways to be photographed for identification, and rapidly developed into a critical situation in spite of the visit of a labor deputation to the president of the republic. The demands of the strikers included the establishment of an eight-hour working day, the recognition of employers' liability for accidents, the establishment of Sunday as a day of obligatory rest, and the redemption of the paper currency at par. In explanation of this last demand, it may be noted that the legal tender peso was worth only 20½ cents in 1913, less than two-thirds of its face value and the government employees who received their wages in legal tender were therefore anxious to increase the value of legal tender by having it redeemable at par. Further indications of the discontent of the workmen were to be found in frequent demands for social legislation, and especially for workingmen's insurance laws. Moreover, the Socialist propaganda met with marked success; according to the first annual report of the Chilean Socialist party, the tri-weekly Socialist organ had increased its circulation from 1200 to 3500 within less than a year.

The completion of the branch railway from Arica on the Chilean coast into Bolivia—the railway has already been mentioned under *BOLIVIA, History*,—was significant for the foreign policy of Chile. The railway will be in Chilean control for 15 years, and, it is darkly hinted, might allow Chile to pour troops into the heart of Bolivia in case of war. The tendency was actually conciliatory, however. Chile declared Arica a free port thereby allowing Bolivian commerce a free outlet through Arica; and there was even talk of selling Arica to Bolivia and thus ending the long dispute between Chile and Peru, a dispute which has lasted ever since 1879-83, when Chile took Tacna and Arica from Peru. The latest phase of the quarrel concerned the papal representative in Chile, Monsignor Sibilia, who was bitterly criticized for having sustained the claims of the Peruvian archbishop of Arequipa to ecclesiastical jurisdiction over Tacna and Arica. This ecclesiastical jurisdiction was felt to be too strongly reminiscent of Peruvian political dominion over the disputed district. Severe press comments were frequent, and excited mass-meetings in Valparaíso and other cities protested against Monsignor Sibilia's policy. Monsignor Sibilia, it is interesting to note, had already aroused considerable antagonism by his intention, real or imaginary, to liquidate the property of the monasteries and religious bodies in Chile, and to send the proceeds, several millions, to Rome.

Late in November Col. Roosevelt, ex-President of the United States, visited Chile and was warmly received by the authorities, although there were demonstrations of a lingering resentment felt by nationalist elements against the Pan-American and Panama policies of the United States. Col. Roosevelt, in his speeches, spoke of Chile as a co-guarantor of the Monroe Doctrine.

CHIMNEY. What was believed to be the tallest steel stack in the world was under construction during 1913 at the new works of the United Verde Copper Company, at Jerome, Arizona. This chimney is 400 feet 1 inch in height from the top of the foundation to the top of the steel and has a lining 30 feet 9½ inches in diameter inside of the steel shell. The brick lining

is supported on the legs of the circular angles which are riveted to the inside of the shell and spaced 15 feet apart so that the weight of brick is carried directly by the entire structure and not merely by the lining itself. Furthermore, any section can be removed at once. There are connections for three flues and the steel plate is protected from the flue gases. The total weight of the chimney is about 875,000 pounds, and it was founded on a concrete base.

CHINA. The Chinese Republic, succeeding the Chinese Empire, dates from January 12, 1912. The capital is Peking.

AREA AND POPULATION. The country consists of the following divisions: China proper, or "the eighteen provinces"; the three provinces comprising Manchuria; Sinkiang province (which includes East Turkestan); and the dependencies of Tibet and Mongolia. The autonomy of Outer Mongolia was recognized by the Chinese government in 1913. The total estimated area is 4,278,143 square miles. The number of inhabitants is unknown, but the traditional figure of 400,000,000 for China proper is doubtless too high. Of China proper there have been many censuses or government estimates; the results of some of these are: 1761, 190,257,000; 1812, 360,440,000; 1842, 413,021,000; 1860, 260,925,000; 1882, 381,309,000; 1885, 377,636,000. The immense variations in these figures make it impossible to rely upon any of them as even approximately accurate. The Chinese census is an enumeration of households, whence the number of individuals is computed by multiplying by the average number in a household (exclusive of children under six years of age). For the census taken in 1910, averages varied in different provinces from 3.1 to 5.8 per household. In some provinces the average was not ascertained, or at least not published, and for these the mean of the ascertained average, namely, 4.8, has been used in calculating the population. The unsatisfactory character of the census is further emphasized by the fact that returns from Shansi and Szechwan were incomplete. For the latter province, the figure given below is not deduced from the census, but is the number reported by the viceroy to the government at Peking; judged from the partial returns of the census, the figure is plausible. Although the new information furnished by the 1910 census is insufficient for definite conclusions, it tends to confirm the opinion that the population of China, though undoubtedly enormous, is much smaller than has been generally supposed. But the estimates of the Maritime Customs conform to the higher figures. The extraordinary total for China proper and Manchuria of nearly 438,000,000, published in 1912, has little acceptance. In respect of more than half of the provinces, they are regarded as gross exaggerations by the best informed students of Chinese population; they are based on no known authority and, in any serious attempt to deduce an approximate total, are negligible factors.

	Sq. m.	Census '10	M. C. est.

* Honan, Kansu, Kweichow, Shansi, and Shensi, 55,000,000. † Not including children under six years. ‡ Including Koko-Nor and Tsaidam.

The population of the city of Peking is calculated on the basis of the 1910 census at 805,110, but a later estimate gives a considerably higher figure. The old city of Sianfu, capital of Shensi, has long been supposed to have about 1,000,000 inhabitants, but this number is probably excessive. For the treaty ports, the Maritime Customs' estimates probably represent the actual population more accurately than they do for the provinces; these estimates for the larger treaty ports, as published in 1912, are: Canton, 900,000; Hankow, 826,000; Tientsin, 800,000; Shanghai, 651,000; Foochow, 624,000; Chungking, 598,000; Soochow, 500,000; Ningpo, 350,000; Hangchow, 350,000; Nanking, 267,000; Changsha, 250,000; Chinkiang, 184,000; Antung, 161,000; Wuhu, 122,000; Amoy, 114,000; Wenchow, 100,000; Shasi, 90,000; Swatow, 66,000; Kongmoon, 62,000; Newchwang, 61,000; Wuchow, 59,000. The number of foreigners living in the treaty ports in 1911, as estimated by the Maritime Customs, was 153,522, of whom 78,306 Japanese, 51,221 Russian, 10,256 British, 3470 American, 3224 Portuguese, 2758 German, and 1925 French.

EDUCATION. The ancient system of Chinese education, which was almost limited to the study of Chinese classical literature, was officially superseded in virtue of the decree of September 3, 1905. This decree abolished the system of examination in the classics as a requisite for public office. Immediately modern subjects and methods were introduced in many towns and cities, and the "western learning" has made rapid progress. This system of public education is based upon that of Japan. Exact statistical data are not available, but it is estimated that there are about 36,000 schools, with a total enrollment of some 880,000 pupils. In addition to the public schools, many of the old-style schools remain, so that the traditional type of education is still obtainable for those who desire it. There are also numerous private schools and Protestant and Roman Catholic mission schools and colleges. At Peking is the Imperial University, a government institution, with Chinese, Japanese, and European teachers. Peking has also a medical college, and Tientsin a university. Colleges have been established in most

of the provincial capitals, and secondary schools and various special schools, as mechanical, agricultural, and military, are springing up throughout China proper. The general educational interest is stimulated by translations of foreign standard works, for which there is great demand. Chinese newspapers, like the schools, are increasing rapidly. Probably the most needed reform at present is some practicable system for romanizing the Chinese characters.

INDUSTRIES. China proper, together with southern and middle Manchuria, is distinctively an agricultural country. Holdings are small, cultivation is intensive, and irrigation is common, but in general the implements used are primitive. Throughout the country many kinds of fruit are produced. The principal crops include wheat, barley, corn, millet, beans, and peas, in the north; in the south, rice, cotton, and sugar. Tea and silk cocoons are products of extreme importance, the former in the west and south, the latter in each of the eighteen provinces. The tea industry has tended in recent years to recover some of the importance it lost through the competition of Ceylon and Indian teas. Silk culture, though at present not regarded as prosperous, is more important than that of tea, and China continues to supply over one-fourth of the world's demand for the raw product. China itself has a large manufacture of silk fabrics, but it is feared that, unless certain defects are remedied, Chinese pongees will have to yield place in European markets to much inferior imitation makes. Cotton manufacture, carried on largely at Shanghai, has developed considerable proportions. Thirty-three mills were reported at the end of 1910, with an annual output of 272,000,000 lbs. of yarn and 45,600,000 lbs. of cloth. A year later the reported number of mills was thirty-four, with 932,506 spindles and 4635 looms. In some of the large cities modern flour and rice mills have been set up. There is some manufacture of iron, especially at Hanyang, near Hankow, but the works here were seriously damaged during the revolution.

China is rich in minerals, but in general exploitation has not attained a large development. The coal deposits are among the richest in the world. Tin, iron, antimony, lead, zinc, copper, and salt are worked, the most important being tin (in Yunnan) and iron.

One of the principal industries, especially in Szechwan, has been the production of opium. The use of this drug became such a menace to the welfare of the Chinese people that the government decided to lessen and, if possible, to extinguish its importation and the cultivation of the poppy. An agreement between China and Great Britain, signed May 8, 1911, provides that the consolidated opium duty (import and likin) be raised from hk.tls. 110 to hk.tls. 350 per picul (133½ lbs.), that the export of opium from India to China shall cease before 1917, if clear proof be given of the complete absence of production of opium in China, and that Indian opium shall not be conveyed into any province of China which has suppressed the cultivation and importation of native opium. In consequence the importation of Indian opium steadily declined in 1911, 1912, and 1913; in 1911 notable progress was made in suppressing poppy cultivation, but in 1912, owing to the inability of the new government at Peking thoroughly to impose its will on the provincial authorities, the area under the poppy increased enormously. But in

1913 the government was able to resume its opposition to opium production, and to a large extent destroyed the crops. Toward the end of the year ten provinces were reported free from poppy cultivation. To assist further in the suppression of the traffic, the Indian government in 1913 abandoned its revenue derived from the sale of opium to China; it was stated that for the first time in the modern history of India no Indian opium was being openly sold to China. There continued, however, over the southern borders, considerable smuggling trade with which the Chinese government had to contend.

COMMERCE. Values of the foreign trade of China are stated in haikwan, or maritime customs, taels. This unit fluctuates with the price of silver; in 1907 it was worth about 79 cents; in 1908, 65.5 cents; in 1909, 63.4; in 1910, 66 cents; in 1911, 65 cents; by the end of 1912 its value had advanced to 75.3 cents. The following table shows, in haikwan taels, the value of total imports, net imports, (imports for consumption), total exports, and exports of Chinese produce:

Year	Imports		Exports	
	Total	Net	Total	Chinese
1902..	325,546,311	315,363,905	224,363,990	214,181,584
1907..	429,071,662	416,401,369	277,050,990	264,380,697
1909..	430,048,606	418,158,067	350,883,353	338,992,814
1910..	476,553,402	462,964,894	394,421,836	380,833,328
1911..	482,576,127	471,503,943	388,410,350	377,338,166
1912..	485,726,000	473,097,000	382,949,000	370,320,000

Principal imports in 1911 and 1912, in thousands of haikwan taels: Cotton fabrics, 89,295 and 81,425; cotton yarn, 51,172 and 62,064; opium, 48,257 and 47,707; petroleum, 34,812 and 24,846; sugar, 22,602 and 24,086; flour, 8708 and 12,694; tobacco, 10,711 and 12,425; rice, 18,699 and 11,660; dyes, etc., 12,313 and 11,462; fish, 10,063 and 10,551; iron, 13,180 and 8806; coal, etc., 8468 and 8221; arms and ammunition, 7748 in 1912; matches, 6793 and 6985; leather, 4810 and 6414; machinery, 6793 and 5792; paper, 5606 and 4304; sacking, 4156 in 1912; wood, 5842 and 4042.

Leading exports in 1911 and 1912, in thousands of haikwan taels: Raw silk, 74,510 and 76,739; beans and bean cake, 48,190 and 41,206; tea, 38,335 and 33,778; cotton, 21,608 and 17,252; silk manufacturers, 18,166 and 17,013; hides and skins, 16,519 and 15,196; oils, 14,631 and 15,046; sesame, 11,739 and 11,966; tin, 6436 and 11,711; straw goods, 15,418 and 11,414; wool, 7648 and 6863; wheat, 6286 and 6258; cattle, 4205 and 5555; tobacco, 3231 and 3761; silks, 4339 and 3741; peanuts, 4563 and 3599; meats, 3384 in 1912; coal, 3362 in 1912; fruits, 3217 and 3344; flour, 3262 in 1912; paper, 3582 and 3250; fireworks, 3480 and 3196; medicines, 3155 and 3028.

The following table shows imports and exports by countries, in thousands of haikwan taels:

	Imports		Exports	
	1911	1912	1911	1912
Hongkong	148,249	147,801	103,670	103,384
Japan	79,506	91,017	62,049	45,262
United Kingdom	89,997	74,856	17,295	15,900
British India	37,034	46,646	5,810	7,573
United States	40,823	36,198	39,966	35,050
Russia	17,266	21,232	50,718	55,197
Germany	22,457	21,130	14,096	14,339

Italy	675	488	9,346	10,843
Other	1,017	2,774	5,654	7,770
Total	482,576	485,726	877,338	870,820
Reexports	11,072	12,629	11,072	12,629
Net imports.....	471,504	473,097
Gross exports...	888,410	882,949

SHIPPING. In 1912 the total tonnage of entries and clearances combined, in both the foreign and the coasting trade, at the treaty ports, was 88,206,000, as compared with 85,772,000 in 1911 and 88,777,000 in 1910. Of the total tonnage in 1912, 44 per cent. was British, 22 per cent. Japanese, 20 per cent. Chinese, 7 per cent. German, and 2 per cent. French. The merchant marine in 1912 consisted of 68 vessels of over 100 tons register (58 steam), with a total net tonnage of 90,420.

COMMUNICATIONS. Roads in China are numerous but generally in poor condition, and the rivers and canals are commercially of more importance. There is a considerable railway development, made possible chiefly by foreign capital, but many years will elapse before rail facilities will be at all commensurate with the industrial and commercial needs of the population. The reported length of railway open to traffic about the beginning of 1912 was 5822½ miles (including the Russian and Japanese system in Manchuria); reported as under construction, 2205 miles (including lines on which work had been begun even though subsequently suspended or abandoned). The political events of the year under review naturally prevented much progress in the Chinese railway construction. The Tientsin-Nanking line was completed, while work was in progress on the line from Chang-sha to Chau-chan. In December an agreement was reached between the German and Chinese governments whereby a concession was made to complete two important railways in the protectorate of Kiaochow in north China at an aggregate cost of \$3,500,000 to \$4,000,000. One of these was to run southward from Kaumi on the Shantung railway via Ichowfu to Haichow at the junction of the Imperial Canal with the Tientsin-Pukow Railway. The second was a continuation of the Shantung Railway to the interior from Tientsin westward to a point on the main line from Peking to Hankow. Each of these lines was to be about 150 miles in length and they were to be built as Chinese state railways by the Chinese ministry of traffic, but the capital, the material, and the chief engineer were to be furnished by Germany, the first-mentioned line being constructed first, if it were not found possible to build both lines at once. At the end of the year the commissioners of the two governments were arranging details so that in the following year operations could be begun. Telegraphs (1910): Lines, 47,197 kilometers with 82,344 kilometers of wire; offices, 560. Post offices in 1911 were reported to number 6201. The postal department, formerly a branch of the maritime customs, was transferred to the ministry of communication in 1911.

ARMY. The reorganization of the military forces of the Chinese Republic was still in progress in 1912 and the formation of the European model army was under way, although various political disturbances naturally inter-

fered with the proper development of those forces. The new army was being recruited by conscription with substitution, but, as a matter of fact, most of the men serving were volunteers. The plan in use provides for three years' service in the active army, three years in the first reserve, and four years in the second reserve, and various estimates were made of the strength, both in the active army and in the total forces on a war basis; 375,000 was one estimate of the total of trained men available, an estimate which includes the relics of the former military organization.

NAVY. Aside from small craft, the only serviceable vessels are several cruisers, and none of these is an armored ship. Four of them (one of 4300 tons and three of about 300 tons each) were built in 1897 and 1898. The fifth, the *Ying Swee*, of 2400 tons, was launched at Barrow in July, 1911, and the sixth, the *Chao Ho*, of 2400 tons, at Elswick in the following October. Both vessels were completed in 1912. A seventh cruiser, of the same type as the *Ying Swee*, was launched at the yard of the New York Shipbuilding Company in May, 1912, and in that year three gunboats, of 780 tons each, were built in Japan, and two smaller ones at Kiel. At the end of 1913 two destroyers were building, one at Elbing and one at Trieste. There is a considerable number of torpedo boats, river gunboats, etc.

GOVERNMENT. The republic of China dates from February 12, 1912, and was recognized by the United States on May 2, 1913, and by the other powers on October 6, 1913. In 1913 the government was still provisional, inasmuch as no complete constitution had been adopted, although constitutional articles relative to the presidency had been adopted by the National Assembly. The presidential office is open to men of at least forty years of age, who have resided in China for ten years. The president is elected by a three-fourths majority of a two-thirds quorum of the National Assembly. Yuan Shikai, who, on February 15, 1912, was declared provisional president, was elected on October 6, 1913, and inaugurated October 10 as the first constitutional president, for the term 1913-1919, with General Li Yuan-hung as vice-president. The legislature, or parliament, is bicameral: The upper house consists of 274 members elected by the provincial assemblies and various electoral colleges for six years, one-third retiring every two years; the lower house consists of 596 members elected by restricted manhood suffrage. The two chambers in joint session as the National Assembly have constituent powers. The ministry during the first half of the year 1913 was formed in November, 1912: Premier and minister of the interior, Chao Ping-chuan; foreign affairs, Liang Yu-hao (later Lu Cheng-hsiang); finance, Cheu Hsüeh-hsi; war, Tüan Chih-jui; marine, Liu Kitan-hsiung; education, Fan Yüan-lien (later Ch'en Chen-hsien); justice, Hsü Shih-ying; agriculture and forests, Ch'en Chen-hsien; industry and commerce, Liu K'uei-yi; communications, Chu Ch'i-ch'ien. On September 8, 1913, a new ministry was formed and approved by both houses of Parliament: Premier, Hsüing Hsi-ling; interior, Chu Ch'i-ch'ien; commerce, Chang Chien; justice, Liang Chih-chiao; communications, Chou Tzu-chi; foreign affairs, Sun Pao-chi; education, Wang Ta-hsieh; army, Tüan Chih-jui; navy, Liu Kitan-hsiung.

HISTORY

THE FIRST NATIONAL ASSEMBLY. A new era of peace and progress, of constitutionalism and reform, was anticipated when the first National Assembly, duly and lawfully elected (see the *YEAR BOOK OF 1912*), met in Peking to form a constitution for the Republic of China. Nation-wide prayer and festivity attended the solemn and exceedingly ceremonious opening of the Assembly on April 8, 1913. Salutes were fired, bands played while 179 senators and 503 representatives met to congratulate each other, and China, upon the happy event. Yuan Shikai, somewhat fearful for his personal security, sent his secretary to read the carefully-worded presidential greeting. "The sovereign powers vested in the government certainly belong to the whole body of citizens. . . . To-day all the members of the National Assembly are elected by the people." Yet they are looked on more as advisers than as delegates of the sovereign people. "Each can certainly give counsel which will be loyal advice to the country. . . . The good fortune of the people of the five races will daily increase and progress. With one heart and with united strength they will establish a strong and great republic." Oratorical prophecies were hardly present facts, however. The Parliament was, it is true, elected by the "people," but by a very small minority of the population; as the *North China Daily News* observed, "So far as nine-tenths of the people are concerned, the election of parliamentary representatives means nothing at all." The people of the five races "was not yet moved by one heart": North and South were sadly estranged and the nation was divided by provincial jealousies as well as by class interests. As for the legislators, they seemed more anxious to secure an effective stage-setting for their epoch-making work, to provide themselves with salaries, souvenirs, and mementos, to have pictures of themselves taken, than solicitous about the grave problems confronting their country—the establishment of constitutional government, the negotiation of loans, the reform of taxation, the reclamation of Inner Mongolia and Tibet, the establishment of "a strong and great republic." Some of the delegates were desirous of reform, but manifested a complete inability to decide on immediate and practical reforms. The most numerous group, and the group of which great things were expected, was the Kuo Ming Tang ("All One Brotherhood"), which had 252 of the 596 seats in the lower house, and 98 of the 274 in the upper house. Ardently insistent on parliamentary government, impatient for "reform" in general, solicitous for the industrial and commercial development of China, intolerant of anything tainted by the old régime, unwilling to submit to foreign financial supervision, and obstinately tenacious of the shreds of Chinese authority in Mongolia and in Tibet, the Kuo Ming Tang bade fair to be a powerful force in remaking China. It possessed from the outset a predisposition to obstinacy, however. Its guiding spirit, Dr. Sun Yat Sen, was not a member of Parliament and might very easily become impatient with slow parliamentary methods and resort to revolution. The strength of the Kuo Ming Tang was in the south, moreover, where Yuan Shikai was still distrusted as a friend of the Manchus, or else as a possible dictator. Un-

fortunately the Kuo Ming Tang was inclined to obstruct and oppose instead of cooperating with the president. This fact, together with a woeful ignorance of parliamentary procedure and the frequent lack of a quorum, made it almost impossible to accomplish anything.

THE QUINTUPLE LOAN. The chaotic condition of Chinese finances made it imperative to negotiate a reorganization loan. The annual charge of the foreign debt amounted to about \$42,500,000; indemnity payments were in arrears to the extent of some \$15,000,000; payment was due on large amounts of Republican bonds, patriotic bonds, and other paper; in addition funds must be provided for the administration, the army, the navy, and the Manchu pensions. All these difficulties would be met temporarily by the proposed international loan of \$125,000,000, but in order to establish an equilibrium between revenue and expenditure in the future, only sweeping reforms would suffice. And for these, as well as for the guaranteeing of the payments on the proposed loan, the provinces must consent to higher taxation, the treasury must be carefully supervised, tax-collection must be reorganized, and economies introduced. The great problem was this: Would the delegates to the Assembly come prepared to give their consent? It seemed not. From the first they were opposed to the conditions of the foreign loan. The sextuple group of bankers, formed in February, 1912, and representing the United States, Great Britain, France, Germany, Russia, and Japan, had demanded the privilege of supervising the expenditure of loan funds and safeguarding the collection of the salt *gabelle* in the interests of investors. This privilege, it was complained, would give the powers too free a hand in Chinese affairs; in protest against it, the new administration in the United States ordered the American bankers to withdraw from the loan agreement on March 19, 1913. The remaining five powers concluded on April 26 a loan of \$125,000,000 as had been proposed, and gained the right to appoint financial advisers to the Chinese government. Sir Richard Dane (British) was placed in charge of the salt *gabelle*; M. Padoux (French) and M. Konavloff (Russian) of the audit department; and Herr Rump (German), of the loan department. Sir Richard Dane at once set to work with Chinese officials to reorganize the *gabelle*, and late in the year announced that the collection of the *gabelle* was proceeding at the rate of \$3,000,000 a month—so satisfactorily, indeed, that an additional quintuple loan of \$125,000,000 was contemplated. On September 29 it was announced that Great Britain had withdrawn from the five-power group, and it was inaccurately stated that the quintuple agreement had fallen to the ground. What really happened was that, having achieved their primary object of saddling the Chinese government with financial "advisers," the parties to the international agreement, which, it will be recalled, had bound each to make no Chinese loan without the consent of all, now declared that henceforth each government would be free to negotiate non-"political" loans and obtain industrial concessions for its own banks. The Chinese were delighted at the prospect of easy loans, and according to current reports, Belgian, French, German, and Austrian syndicates had already arranged for concession.

THE OPPOSITION. The conclusion of the quintuple loan had been the work of Yuan Shi-kai and his ministers, not of the Parliament. And now Parliament attempted to cripple the president by refusing to sanction the loan. Not only was it indignant at the disregard of its authority; the conditions of the loan were hotly opposed by the Kuo Ming Tang, and it was felt that Yuan had sacrificed Mongolia and Tibet to please his creditors. It was feared, moreover, that with his new financial backing the provisional president would be unduly powerful. It was therefore not surprising that the Parliament not only refused the loan, but went on in July to censure the government and to impeach the ministers. As a conciliatory measure, Yuan consented to dismiss the minister of foreign affairs and the premier. But meanwhile serious trouble had been developing outside of Parliament.

Outside of Parliament the loan had been bitterly censured, and Dr. Sun Yat Sen had declared that it meant the separation of north and south. But even more powerful in moulding public opinion was the Sung Chiao-jen murder case. In March, 1913, General Sung Chiao-jen, a prominent revolutionary general and an influential member of the Kuo Ming Tang, was murdered at Shanghai, at the instigation of Yuan, so it was rumored. At any rate, the government did not proceed against the assassin with satisfactory energy, and the friends of General Sung openly threatened to avenge his death. More trouble was caused by the summary execution of Generals Chang Ching-wu and Fang Wei. And then governors, or *tutuh*s, of three provinces were dismissed for flouting his authority, Yuan said; for protesting against the murder of Sung Chiao-jen, the Kuo Ming Tang alleged. The ex-*tutuh*s, and notably Li Lieh-chan, joined with other malcontents to intrigue against the president.

THE JULY REBELLION. Realizing that the troops in the Yangtze provinces were ready to mutiny, Yuan Shi-kai made desperate efforts to reduce them while strengthening his loyal northern troops. Early in July mutinous outbreaks gave him an excuse to dispatch northern troops to Shanghai and Kiukiang (on the Yangtze-kiang) in the provinces of Kiangsu and Kiangsi, respectively. In the latter place a collision between the northern and southern troops occurred on July 12. News of the fight inflamed the rebellious elements in the southern and coastal provinces—especially Kiangsu, Anhwei, Chekiang, Fukien, Kiangsi, Kuangtung, Hunan, and Szechwan. On July 15, General Huang Hsing was proclaimed by the *tutuh* of Kiangsu to be commander-in-chief of a "punitive expedition" against Yuan Shi-kai. On July 18 General Chen Chi-mei declared the independence of Shanghai. Other places followed suit, but, contrary to expectations, the provincial governments of Chekiang and Hunan remained neutral. *Tutuh* Chen Chuang-ming and the Provincial Assembly of Kuangtung proclaimed independence and issued an interesting indictment of Yuan. First, he executed Generals Chang Ching-wu and Fang-wei. Second, "he hired assassins to murder Sung Chiao-jen, and when proof was produced, he allowed Hung Shih-tso to escape, and arranged for Lin Shiching and Tsen Ping to be poisoned at Peking." Third, "when the complicity of the government in the murder of Sung Chiao-jen was discovered,

he tried to suppress protests from the people by force and fearing that his funds would not be sufficient, he borrowed money from foreigners against the protest of Parliament." Fourth, "he connived at Russian advances in Mongolia and British claims in Tibet, hoping to curry favor with those powers when he wanted a loan." Fifth, the budget is unsatisfactory and the administration corrupt. Sixth, while disbanding southern troops he daily recruited troops in the north. Seventh, "he bribed the members of Parliament so he could rule as dictator." Dr. Sun Yat Sen somewhat tardily declared himself for the south, in manifestos of July 21.

It was estimated that the rebel forces aggregated 82,000 men distributed as follows: Li Lieh-chun and O Yang-wu, 13,000; Kiangsu army, 25,500; Cantonese army (with some rebels from Hunan), 20,000; Anhwei army, 14,000; Fukien army, 10,000. One large body of insurrectionaries started towards Peking to overthrow Yuan, and crossed the Yangtze River on their northward march, but were defeated on July 20 on the Shantung border and evacuated Hsu Chow-fu before the northern troops. Meanwhile the northern forces in the province of Kiangsu were consistently victorious and soon crushed the rebellion there. Kuangtung was only half-heartedly rebellious and its capital, Canton, was restored to order in August. Within a few weeks of its outbreak the insurrection was confined to Kiangsu province, although desultory fighting continued in other districts, especially in Szechuen. In Kiangsu there was severe fighting at Shanghai, at the Woosung forts, and at Nanking. In Shanghai the northern troops defended the arsenal against rebel onslaughts on July 23 and beat off night-attacks on succeeding nights. During the course of the hostilities foreign marines were landed to protect the foreign settlement at Shanghai. The ultimate victory of the loyalists at Shanghai was due largely to the assistance of the navy, the fidelity of the sailors having been ensured by a payment of wages from funds advanced on the quintuple loan. The Woosung forts were stubbornly defended by the rebels until August 13. Nanking, however, was more strongly garrisoned and withstood the attacks of the northern General Chang Hsun throughout the month of August. With the fall of Nanking the rebellion practically ended.

THE APOLOGY TO JAPAN. During the week of lawlessness and looting that followed the fall of Nanking, three Japanese citizens were killed in that city. Reparation was demanded by a Japanese note of September 10, after excited crowds in Tokio had manifested an alarmingly bellicose spirit. The Japanese demands were everywhere commented upon for their severity: The Japanese government, and especially General Chang Hsun must apologize, the offending soldiers must be punished, General Chang's troops must defile before the Japanese consulate in Nanking, and indemnities must be paid. The Chinese government complied, but General Hsun, with a fine regard for his own dignity, prolonged the excitement by refusing to make amends. Finally, on September 28, after a Japanese squadron had been dispatched to inspire him with contrition, he offered apologies, and later sent his soldiers to present arms before the Japanese consulate. Several Chinese

soldiers were publicly executed as the probable murderers of the three Japanese. The whole affair gave an unfortunate stimulus to anti-Japanese feelings in China. It was generally believed that Japanese aid had been given the rebels in the recent insurrection, and rumors to that effect received credence despite Japan's official denials. It was well known, moreover, that popular sentiment in Japan was heartily on the side of the south, and lent moral if not material encouragement to the enemies of Yuan Shi-kai. Dr. Sun Yat Sen was exceedingly popular with the Japanese, and other rebel leaders, with prices on their heads, were allowed to find refuge in Japan. It was therefore not entirely without reason that Japan's exacting demands in the Nanking case were denounced in China.

THE NEW CABINET. Shortly before the outbreak of rebellion, the Chao Ping-chuan ministry had been attacked by Parliament, and two of the cabinet had resigned. The most radical members of the Kuo Ming Tang had left Peking and joined the insurrectionary forces, while the moderates had remained and attempted to make peace with Yuan Shi-kai. The president was amenable to their overtures and allowed Parliament to choose a premier. On July 23 the lower house elected Hsuing Hsi-ling by a vote of 260 to 180, and the choice was confirmed a week later in the Upper House by 124 to 72. Hsuing Hsi-ling encountered great difficulties in selecting a cabinet, but at last, on September 8, he announced the following appointments: Commerce, Chang Chien; justice, Liang Chih-chiao; communications, Chou Tzu-chi; foreign affairs, Sun Pao-chi; education, Wang Ta-hsieh; army, Tuan Chih-jui; navy, Liu Kuan-hsiung; interior, Chu Ch'i-ch'ien. The cabinet, although drawn from the *Chinputang*, or government party, was accepted by substantial majorities in both houses, for its members were mostly men of moderate views and wide experience. Hsuing Hsi-ling himself, a native of Hunan province, had the reputation of a scholar, an able statesman, and an ardent reformer. His administration was opened auspiciously by a declaration of amnesty to penitent ex-rebels, and his programme betokened enthusiasm and energy. Poverty in the lower Yangtse valley would be alleviated by the establishment of workhouses for the indigent, the assistance of merchants, the promotion of agriculture, and the prohibition of gambling. The army would be deprovincialized by the creation of nine military districts; thus the danger of provincial secession would be removed. Finance would be reformed by cutting down the number of useless officials, by reducing military expenditure, by increasing the land, poll, stamp, and title-deed taxes, by reorganizing the government timber business, and by raising the customs tariff. Before the end of the year he had turned hundreds of unnecessary government employes out of office.

THE PRESIDENTIAL ELECTION. Meantime a committee of both houses of Parliament had been drafting a constitution. The work was as yet incomplete, but anxiety to hasten the election of a constitutional president—an indispensable condition for recognition by the powers—led the Assembly to adopt the articles relative to the presidency in September. The French system was followed in a general way,

the president being chosen in joint session of the houses of Parliament. His term was fixed as six instead of seven years, however, and a three-quarters vote instead of a majority was required for election. The requirements of a three-quarters vote of a two-thirds quorum was criticised as too exacting, and would probably work badly in a close contest. The president must be forty years of age and ten years resident in China, and would not be eligible for immediate reelection. In accordance with these provisions, the National Assembly—or joint session of Parliament—met on October 6 to elect a president and vice-president. The result was a foregone conclusion; nevertheless, it was not until the third ballot was taken that Yuan Shi-kai received the requisite three-quarters vote. The vote stood: For Yuan Shi-kai, 507; for Li Yuan-hung, 179; total, 686. Subsequently Li Yuan-hung was elected as vice-president. Almost immediately the members of the diplomatic corps at Peking hastened to recognize the republic. A few days later, on October 10, Yuan Shi-kai ceased to be provisional president and was inaugurated as president.

THE KUO MING TANG AND THE CONSTITUTION. As we have already noted in connection with the presidential election, a part of the constitution was adopted in September by the National Assembly. The committee which prepared the draft constitution was composed of 30 members of each house of Parliament, and held its inaugural session on July 12. Of the 60 committeemen, 32 owed allegiance to the Kuo Ming Tang, 17 to the *Chinputang*, and 11 to the *Kinghotang*. The majority reported a draft constitution of 113 articles in September. As was to be expected, the proposed constitution vested practically all powers in Parliament and would have made Yuan Shi-kai a mere figure-head without the right even nominally to select his ministers. Freedom of speech, press, residence, and worship were guaranteed. In connection with the latter it may be remarked that a considerable agitation for the establishment of Confucianism as a state religion was counteracted by the efforts of devotees of other religions (Taoism, Mohammedanism, Buddhism) and the protests of Christian missionaries. It was on the question of presidential powers that the constitution shipwrecked. Quite naturally and not unjustifiably Yuan insisted on a strong executive, and offered three amendments relative to (1) the determination of the administrative system; (2) the appointment of foreign ministers; and (3) the treaty-making power. Vice-president Li Yuan-hung urged that the ministry should not be responsible to Parliament, since the ablest men would be willing to serve one master, the president, but not many masters in the Parliament. nevertheless the Kuo Ming Tang persisted. Just at this time several telegrams were discovered which revealed the treasonable correspondence of Kuo Ming Tang parliamentarians with the leaders of the July rebellion. The discovery furnished Yuan with a convenient excuse for doing away with his stubborn opponents. On November 5 he issued three mandates countersigned by the premier and the minister of the interior, dissolving the Kuo Ming Tang, and unseating its members of Parliament—252 of the 596 members of the lower house and 98 of the 274 in

the upper house. The step was a bold one, but it succeeded—at least for the time being. So confident was the president that on November 24 he dispensed with martial law in Peking.

THE COUNCIL. Parliament could now no longer obtain a quorum and was forced to adjourn until alternates should fill the vacant seats. In the meantime about 300 members continued to meet about once a week to discuss the situation. Yuan Shi-kai did not intend to interrupt constitution-making, however. A new body was called, or rather an old body, the Central Administrative Council (*Hsingchen Huiyi*) under a new name. The Political Council (*Chentzu Huiyi*) met first on December 15. It consisted of 8 members of the presidential secretariat, two representatives of the cabinet, one of each of the nine ministries, four from Mongolia, four from Tibet, and two from each province—in all, 71. The council was to discuss the appointment of another council to draft a constitution, and was to advise the government on administrative measures. The new draft constitution would then be submitted for ratification to the National Assembly.

RUSSIA AND MONGOLIA. The Mongolian question, discussed at length in previous **YEAR BOOKS**, continued to agitate Russo-Chinese relations. It will be recalled that on October 21, 1912, a Russo-Mongolian agreement had been signed at Urga, by which Russia agreed to "assist Mongolia to maintain the autonomous régime which she has established, as also the right to have her national army, and to admit neither the presence of Chinese troops in her territory nor the colonization of her land by the Chinese." The privileges conceded in return by Mongolia and defined more particularly in the protocol of November 3, 1912, gave Russians a free hand in the sphere of trade, exempted Russian merchants from the payment of customs dues, entitled Russians to the protection of Russian consular courts, and allowed them to establish "factories" or trading settlements. All this applied to Outer Mongolia, but might easily be extended to Inner Mongolia. The endeavor of the Russian government to gain recognition for the Urga agreement and protocol was the central fact of the year's diplomacy. On May 28 a draft treaty was submitted to the Chinese Parliament whereby China would recognize the previously-existing autonomy of Outer Mongolia, and the Russian commercial privileges in that province, would refrain from colonizing Mongolia, and would accept Russia as a mediator in dealing with Mongolia. Russia, on the other hand, would recognize both Inner and Outer Mongolia as integral parts of China. Such an agreement was by no means acceptable to patriotic Chinamen, and the Parliament temporized until on July 13 a Russian note informed the Chinese government that negotiations were now broken off as a result of a lack of frankness on the part of China. China must recognize the Urga convention and protocol before negotiations could be resumed. Almost at the same time, a brigade of Russian railway guards and three batteries of Russian artillery were moved to Tsitsihar in the province of Heilungkiang as a protest against the Russophobic policy of the tutuh of that province. Intimidated, the Chinese government hastily dismissed the tutuh in question and

made reparation for losses sustained by Russian traders. It was quite evident that Russia would listen to no remonstrances as far as Mongolia was concerned, and on November 5 a Russo-Chinese treaty of five articles was signed. As in the proposed treaty Russia recognized Chinese suzerainty over Mongolia; China recognized the autonomy of Outer Mongolia.

China was to have representatives in Mongolian trade centres; Russia was privileged to establish consular guards (1000 men or less). Subsequently, on December 12, the Russian minister in Peking created a sensation by proposing that all foreign troops should be withdrawn from northern China.

The hostilities between Chinese and Mongolian troops in eastern Mongolia continued throughout 1913, but were of little significance. During the greater part of the year a body of several thousands of Mongols was operating in a region about 300 miles from Kalgan, that is, within 300 miles of the Great Wall, and repeatedly defeated the Chinese forces.

TIBET. Chinese troops were also unsuccessful in eastern Tibet and the expeditions sent out against the Tibetans by the tutuh of Szechwan were dismal failures. The status of Tibet was discussed in November at a tri-lateral conference at Simla between China, Tibet, and Great Britain. From Simla the conference was adjourned to Delhi. The negotiations seemed to be hopelessly obstructed by the refusal of the Chinese delegate, Ivan Chen, to concede the Tibetan demands that (1) the complete autonomy of Tibet should be recognized, (2) no Chinese officials of any description should be stationed in Tibet, and (3) large indemnities should be paid for the damage done by Chinese troops to ecclesiastical and other property in Tibet.

THE OPIUM TRAFFIC. The friction between the Chinese and British governments over the opium traffic was not lessened by the presence in Great Britain of a Chinese anti-opium orator. At the beginning of the year there were in Hongkong and Shanghai accumulated stocks of Indian opium to the value of \$51,250,000.

Anxious to prevent the sale of opium in China, the Chinese government offered to pay the cost of reshipping the opium to other markets; the offer was refused, however. In justification of the refusal, it was pointed out that some opium was still grown in China; that if the Chinese were patient, the Indian opium trade would probably be suppressed in 1917 in accordance with the convention of May, 1911; and that the bankers interested in the opium held in Chinese ports could not afford to sell it at lower prices elsewhere. The situation grew more and more unpleasant: The British minister threatened to inform his government that mere diplomacy was no longer of any use. Nothing came of the threat, however, and on December 24 the Chinese government issued a half-hearted mandate enjoining treaty-observance upon provincial authorities. CHORAL SOCIETIES. See **MUSIC**.

CHOSEN. See **KOREA**.

CHRISTIAN ENDEAVOR, UNITED SOCIETY OF. An interdenominational society for

young people, founded in Portland, Me., in 1899. Conventions of the society are held biennially. The 26th convention was held at Los Angeles on July 10, 1913. The membership of the society is about 4,000,000, and about 80,000 different societies. The officers in 1912 were as follows: President, Frances E. Clark, D.D.; general secretary, William Shaw; editorial secretary, Amos R. Wells; treasurer, H. N. Lathrop; interstate secretary, Karl Lehman.

CHRISTIANS. The denomination known as Christian originated in 1794 in Virginia and North Carolina. Independent movements in New England (1800) and Kentucky (1804) on similar lines were merged with that of the South. The founders rejected creeds and "unscriptural" names as perpetuating division. They stood for the Bible as their only rule of faith, with liberty of interpretation for the individual believer. Christian character was taught as the basis of fellowship, no doctrinal or ceremonial tests being required. In form of government they are congregational, but the churches are united in conferences and conventions for coöperative effort. The highest representative body is the American Christian Convention, made up for the most part of delegates from the conferences. This organization has supervision of the general work of the denomination.

School maintained by the denomination are Union Christian College in Indiana, Defiance College in Ohio, Starkey Seminary in New York, Elon College and Franklinton Christian College (colored) in North Carolina, Palmer College and Weaubleau College in Missouri, and Jireh College in Wyoming. It has one theological school, the Christian Biblical Institute in Ohio. Mission work is carried on in Japan, Porto Rico, and continental United States and Canada. Periodicals are the *Herald of Gospel Liberty*, published in Dayton, Ohio; *The Christian Sun*, in North Carolina; and the *Christian Vanguard*, at Toronto, Canada. A monthly magazine, *The Christian Missionary*, is published in the interest of missions. There is a home for aged Christian ministers at Lakemont, N. Y., and an orphanage at Elon College, N. C. The latest statistics give the membership as 104,027.

CITY PLANNING. The city planning movement continued to grow, in all parts of the world. Improvements to the plans of existing cities were being proposed on every hand, and

here and there portions of these improvements are being carried out. More rarely, the building of a new industrial town or the founding of a State capital, *de novo*, as for the commonwealth of Austria, gives occasion for laying out an entirely new city.

Most of the replanning of cities was still being done by civic organizations and had not got beyond the paper-plan stage. A number of cities, fortunately, now have permanent city planning commissions, though these are mostly advisory in character. Such commissions were made compulsory for all cities and the larger towns of Massachusetts, in 1913, and permissive legislation for their organization was granted in a few other States. General societies for the promotion of city planning were formed during the year in the United States, Canada, and Great Britain, and City Planning Exhibits were held at home and abroad. Important constitutional amendments authorizing excess condemnation are outlined farther on.

Before passing in review some of the chief city planning events of the year, the broadening of the scope and meaning of the modern city-planning movement needs to be realized. It no longer concerns itself merely with the street plans of a city and the grouping of parks, playgrounds, and public buildings in their proper relation to each other. It now includes transportation facilities by land and water, with their proper terminals, water supply, sewerage, surface drainage, lighting, and a score of other public services which supply the needs, and make for the comfort, convenience, welfare, and uplift of the citizens. It also includes various æsthetic features. As a rule, however, these are best brought out by making each element in the city plan the best possible expression of the service it is designed to render, leaving adornment to come as a crowning grace to natural beauty. Had this principle been followed in all city planning reports and less emphasis been laid upon the "city beautiful," a larger percentage of the plans thus far made would have got beyond paper. Where a city already has all or a greater part of the utilities, the main tack of city planning should be such rearranging as will remedy defects due to a lack of foresight or skill, and an effort to bring all the elements into a harmonious whole, not overlooking æsthetics nor the amenities of city life, nor the individuality of the city and its people.

REPORTS, PLANS, AND COMMISSIONS. A fairly complete list of places for which city planning studies and reports had been made in the last decade, with the date of the report, by whom made, and for whom (association or public officials) made, is given herewith. The list includes 62 places. The distribution of the reports by years is as follows: Date not given, 12; 1902, 1; 1903, 2; 1904, 2; 1905, 2; 1906, 4; 1907, 5; 1908, 3; 1909, 8; 1910, 4; 1911, 12; 1912, 5; 1913, 4.

Some of the reports cover an extensive remodeling of the whole city plan and others relate only to elements of the plan, such as parks or civic centres.

According to a paper by Flavell Shurtleff, read before the City Planning Conference, April, 1913, the following 18 cities then had city planning commissions:

Hartford, 1907*; Milwaukee, ? †; Chicago, 1909 †; Baltimore, 1910*; Detroit, 1910 †;

Newark, 1911*; St. Louis, 1911†; Cleveland, 1911†; Jersey City, 1911*; Pittsburgh, 1911*; Philadelphia, 1911†; Salem, Mass., 1911†; Lincoln, Neb., 1911†; Trenton, N. J., 1912*; Cincinnati, 1913†; Scranton, Pa., 1913*; Schenectady, 1913†; Paducah, 1913†. In Canada, 9 cities had city-planning commissions early in 1913, as follows: Calgary, Edmonton, Lethbridge, Regina, Saskatoon, Winnipeg. See also statement further on under sub-head, *General Legislation*.

NEW INDUSTRIAL CITIES. Either commercial or humane reasons, or the two combined, have led to the building of immense industrial plants and with them cities of considerable size in what were formerly unoccupied areas. A well-known American example is Gary, Ind., built in and since 1906 by the United States Steel Corporation. A brief, popular description of the new industrial town of Torrance, Cal., between Los Angeles and the seacoast, may be found in *The American City* for October, 1913. More detailed technical descriptions of the city itself appeared in *Engineering News* of October 30, 1913. The new industrial coal mining town of Kincaid, Ill., construction of which was begun in 1913, was also described in *Engineering News* of January 8, 1914.

CIVIC CENTRES, or carefully planned groups of public buildings, have been more or less definitely planned during the past few years for a number of cities, and the plans have been partly or wholly carried out in a few cases. Among the cities reported as having civic centre plans are Akron, Ohio; Cedar Rapids, Ia.; Cleveland, Ohio; Denver, Col.; Hamilton, Ohio; Kansas City, Mo.; Milwaukee, Wis.; San Francisco, Cal.; Springfield, Mass.; Toledo, Ohio; Waterbury, Conn.

In December, 1913, Springfield, Mass., dedicated a new city hall and municipal auditorium, together with a monumental clock tower placed between the two. Denver acquired the larger part of the area for a civic centre, well set in public grounds, the whole adjoining the existing capitol grounds. Looking from the latter across Broadway, one will see a plaza, then a sunken garden with a formal grove on either side. Beyond the garden there will be a lawn, flanked on one side by a library building, already erected, and on the other by an art building. The plan calls for closing the vista by a municipal building.

THE AUSTRALIAN CAPITAL PLAN. An account of the competition for the new capital of the commonwealth of Australia, at Canberra, New South Wales, was given in the article, *CITY PLANNING*, in the 1912 YEAR BOOK, and the prize plan of Walter Burley Griffin, of Chicago, was there reproduced. After the result of the competition was announced, all the plans received were most unfortunately referred to a departmental board, to make up a composite plan from the best elements of each. Disinterested experts declared that the result was the hodge-podge that might have been expected. In 1913 Mr. Griffin was invited to go to Australia to confer with the authorities there. This gave rise to hopes that Mr. Griffin would be given the opportunity to work out his plan with such modifications as might be determined upon after

an actual visit to the site and conference with the Australian officials.

THE NEW CAPITAL OF INDIA. The removal of the capital of India from Calcutta to Delhi, sanctioned by the British Parliament in 1912, was followed by a series of reports by the Delhi town planning committee, printed in India and dated London, 1913.

GENERAL LEGISLATION. The Massachusetts legislature of 1913 made it mandatory for every city of the commonwealth (nearly 35) and every town of more than 10,000 by the last preceding Federal or State census, to create a "planning board whose duty it shall be to make careful studies of the resources, possibilities and needs of the city or town, particularly with reference to conditions which may be injurious to the public health or otherwise injurious, in and about rented dwellings, and to make plans for the development of the municipality with special reference to the proper housing of its people." (Chap. 404, *Mass. Laws* of 1913.)

The New York legislature of 1913 authorized (chap. 699) cities and villages to appoint planning commissions, and the Pennsylvania legislature (bill 406) made it mandatory for each city of the third class (more than 20) to create a city planning department in charge of a city planning commission. The Pennsylvania legislature also created the Philadelphia suburban metropolitan planning district (bill 226) with authority to propose various improvements, the adoption of which is optional with the several municipalities in the district.

The province of Alberta, Canada, passed a town planning act in 1913, which appears to give both the several municipalities and the administrative branch of the provincial government more power over city planning than has yet been granted in the United States.

EXCESS CONDEMNATION. Constitutional amendments were adopted by popular vote in New York, Ohio, and Wisconsin, in 1913, making possible the adoption of excess condemnation, or the compulsory taking more land than is needed for public improvements, with the privilege of subsequent sale. Massachusetts led in this movement by a constitutional amendment adopted by popular vote in 1911.

REGULATION OF BUILDING HEIGHTS. A heights of building commission was created by the board of estimate and apportionment of New York City early in 1913, and made public some of the results of its studies, at the close of the year. Numerous maps and diagrams showing actual conditions in New York City were prepared and detailed recommendations for limiting building heights were made. A maximum height of 300 feet at the street line was recommended, but with permissible excesses in case of set-backs from the street line and with no height limit for towers not covering more than 25 per cent. of the total area of the lot. It is reported that the committee found that the Woolworth building (750 feet high) is from 670 to 685 feet higher than the maximum limit for buildings in London, Berlin, Paris, Rome, and Stockholm. The maximum building heights permitted by ordinance in some of the largest cities of the United States is given as follows: Milwaukee, 225 feet; Chicago, Cleveland, Erie, Fort Wayne, Indianapolis, Newark, 200 feet; Baltimore, 175; Portland, Ore., 160; Los Angeles, 150; Boston,

* Created by legislation. † Created by city ordinance.

SOCIETIES, CONFERENCES, AND EXHIBITIONS. The National Conference on City Planning was held at Chicago in May, 1913; the first Canadian Housing and Town Planning Congress at Winnipeg, Manitoba, in July, 1913; and the first Massachusetts City and Town Planning Conference at Boston, in November, 1913, under the auspices of the governor and the home-
stead commission. An international town planning conference was held at Ghent during the year, an international garden cities and town planning association was organized in London, and tentative plans were made for a conference, if possible at Letchworth, in July, 1914; and late in the year a British town-planning institute was organized in London. City planning exhibits were held at the Ghent conference, while in New York City, in November, there was a city planning exhibition, under the joint auspices of the city of New York and the Merchants' Association of New York City.

BIBLIOGRAPHY. A "Select List of Works Relating to City Planning and Allied Topics" was issued by the New York Public Library in October, 1913. It included some 600 references to other bibliographies, periodicals giving attention to city planning, and books, reports, and articles on the subject. See also MUNICIPAL GOVERNMENT.

CIVIC ASSOCIATION, AMERICAN. A body organized in 1904 for the purpose of the cultivation of higher ideals of civic life and beauty in America, the promotion of city, town, and neighborhood improvement, the preservation and development of landscape, and the advancement of outdoor art. The association has directed special attention to the importance of comprehensive city planning, and as kindred to this subject such other activities as the creation, development, and maintenance of parks and boulevards; the wise planting and care of trees, the elimination of the smoke, billboard, and house-fly nuisances; the organization of adults and children in the working group for civic improvement. During the summer of 1913, in the extension of its service to American committees, a group of members visited European countries for the purpose of studying the civic advance and the methods adopted in those countries for efficient administration. Four weeks were spent in German cities, one week in Paris, and one in London. During the early months of the year, the activities of the association were largely directed to securing from Congress a continuation of the necessary protection of Niagara Falls, due to the approaching termination of the Burton bill, which limited the diversion of water for commercial purposes, from the American Falls. Later in the year at the regular session of Congress, renewed efforts on the part of the association were taken up to secure a reenactment of the terms of the Burton bill. The association has led in the national movement for the protection of national parks in which it has continued its recommendation first proposed at its convention in 1910 for the creation of a national parks service. As a specific endeavor in behalf of the parks, the association coöperated actively for the preservation of the Hetch-Hetchy Valley, and opposed the granting of a permit to the city of San

Francisco to create a storage reservoir in the valley for a domestic water supply.

CIVIC CENTRES. See CITY PLANNING.

CIVIC FEDERATION, NATIONAL. The 14th annual meeting of the federation was held in New York City on December 11 and 12. The programme included reports from the various departments of the federation on many important propositions of national interest. A department on compensation for industrial accidents and their prevention; the food and drug department; a welfare department; the woman's department; the department of industrial mediation laws; the department on the regulation of municipal utilities; the department on the regulation of industrial corporations, and the department on industrial economics. The department on compensation for industrial accidents, and their prevention, had during the year a commission of six men who made a study of the actual results of the working of the various forms of compensation acts. The commission confined its work to the States where a compensation law has been in effect for at least a year. These States include Massachusetts, New Jersey, Michigan, Ohio, Illinois, Wisconsin, California, Oregon, and Washington. The report of the commission contained the results of a *questionnaire* sent to 25,000 employers in these States, who have either accepted the acts or who have refused to do so. The views of the working men themselves either through their unions or as individuals, was also included in the report. In the light of the information secured by this commission, the model workmen's compensation bill of the National Civic Federation, will be redrafted. One session of the meeting was devoted to the construction of the drug department. An expert committee was making investigations into this problem during the year. The department on industrial mediation laws reported a model State mediation bill. The department on regulation of municipal utilities reported a proposed model bill for the regulation by the State of street railways, gas, electric light, and other municipal utilities. The department on regulation of industrial corporations presented a proposed bill supplementing the "Sherman anti-trust act."

The woman's department reported on its various activities in its different branches. The development of the year in welfare work, which has been specially important among large corporations, were a part of the report of the welfare department. This department proposed the establishment of a permanent exhibit to give to employers, standards that may be followed.

CIVIL SERVICE. The total number of competitive positions under the federal civil service on June 30, 1912, was 395,460. Of these, 61,388 were excepted and non-competitive positions, and 59,423 were unclassified positions. The positions filled by presidential appointment numbered 10,397. The largest number of positions under the civil service were held by fourth-class postmasters. Of these there were 14,169 holding competitive positions and 36,332 holding non-competitive positions. In the rural free delivery service were 43,006 holding competitive positions and one thousand holding non-competitive positions. In the post offices except fourth-class postmasters, there were 77,559 holding competitive positions, 2413 non-com-

petitive, and 13,263 unclassified. In the rural mail service were 17,404 competitive positions, 121 non-competitive, and seven unclassified. In the State Department were 7572 positions under the civil service, in the Department of the Interior 5056, in the Department of Commerce 2590, in the Department of Agriculture 3404, the Government Printing Office 3942. These were all employed in the Federal offices in Washington. The total number of employes in the government offices in Washington was 32,368.

PRESIDENT WILSON'S ADMINISTRATION AND THE CIVIL SERVICE. It was well known from President Wilson's writings and utterances previous to his election as President, that he was entirely in favor of the principle of selection of government officers and employes by a civil service examination. The pressure brought to bear upon the incoming President by would-be office holders and their supporters is so strong that there was a great public interest as to how the President's action in regard to filling these offices would compare with that of his predecessors. One of the first acts of his administration was to turn over to his cabinet heads the duty and responsibility of receiving applications for office. He announced on March 5 that he did not intend to see applicants for office in person, unless he himself invited the interview, and that it was his intention to deal with the appointments of the heads of several of the executive departments.

FOURTH-CLASS POSTMASTERS. One of the most interesting questions in regard to the application of the merit system arose in the Post Office Department in relation to a large number of fourth-class postmasters. In 1908 President Roosevelt by executive order classified or put under civil service rule, about 15,000 fourth-class postmasters in the territory north of the Ohio and Potomac rivers and east of the Mississippi. On October 15, 1912, shortly before the presidential election, President Taft, by another executive order, classified all the remaining fourth-class postmasters in the United States, numbering 36,000. This made a total of 51,000 fourth-class postmasters who had been classified in the permanent civil service. These postmasters had not been required to pass any sort of examination. President Wilson, by an order issued on May 7, 1913, amended the orders of his two predecessors by providing that no fourth-class postmaster should be given a competitive classified status unless he had taken and passed a competitive examination. He further ordered that all vacancies in these offices should be filled through examinations conducted by the National Civil Service Commission or by post office inspectors. It was reported late in the year that the Postmaster General had decided to recommend the classification of all second and third class postmasters, who number about 8000; and at about the same time the Secretary of Commerce recommended to Congress the employment of fourteen commercial attachés at American embassies and legations, to supplement the work of the consular service, in sending commercial information, and so promoting the commerce of the United States. These were to be appointed without civil service examinations.

STATE DEPARTMENT. In the Department of State, the executive orders of the two preceding administrations were adhered to during the year, exceptions being made only when, in the

case of vacancy in one of the higher positions, the President at the time did not find within the service a person entirely qualified. Up to December 1, all previous executive orders had been maintained in regard to about thirty secretaries of embassies and legations, 22 consuls general, and 50 consuls, all of whom had been appointed, transferred, or promoted through original examinations.

REMOVALS AND APPOINTMENTS. In the first nine months of the administration, the following changes were made in unclassified officers not under the civil service rules. Postmasters of the first, second, and third class, 2572; collectors of internal revenue, 31; collectors of customs, 24; United States district attorneys, 30; registers of general land office, 21; United States marshals, 19.

ATTACKS ON THE MERIT SYSTEM. There were several attacks made in Congress upon the merit system. These proceeded for the most part from members of the Democratic party of both House and Senate. The most serious of these was a proposed amendment to the post office appropriation bill which provided for the repealing of the orders classifying fourth-class postmasters previously alluded to above. This amendment was defeated in the House by a vote of 141 to 107; 40 Democrats voting against the repeal. An amendment to cut off the appropriation for the expenses of post office inspectors in conducting examinations, was adopted in the House by a close vote, but was rejected in the Senate. The income tax collection provision in the tariff bill was opposed by the United States Civil Service Commission and by many business organizations throughout the country, and was in consequence amended so that appointment should be made under rules and regulations to be fixed by the Secretary of the Treasury. In October, the Secretary of the Treasury issued regulations governing the appointments to the income tax collection force. Under these regulations, nothing but pass examinations can be held so that there will be no competitive system of appointments. Moreover, every candidate is to be asked in what Congressional district he claims legal residence. To the adoption of this measure, the Republicans were uniformly opposed, and 57 Democrats also voted against it. The seven bills introduced in the Senate to extend the Federal classified service, were all introduced by Republican senators.

An attempt was made to pass a "rider" to the urgent deficiency appropriation bill, removing from the competitive classified service, practically all deputy collectors of internal revenue and deputy United States marshals. The deputy collectors had been in the competitive classified service since 1907, the competitive marshals since 1909. Opposition to the passage of this "rider" was very strong in Congress, and party lines were to a large extent obliterated. It was, however, passed by a majority of five, 57 Democrats voting against it. The President was urged by the National Civil Service Reform League and other bodies and individuals to veto the bill containing the "rider." He signed it, however, with the following memorandum: "I am convinced after a careful examination of the facts that the offices of deputy collector and deputy marshal were never intended to be included under the ordinary provisions of the civil service law. The control

of the whole method and spirit of the administration of the provision in this bill, which concerns the appointment of these officers, is no less entirely in my hands than it was before the bill became a law; my warm advocacy and support both of the principle and the *bona fide* practice of civil service reform is known to the whole country, and there is no danger that the spoils system will creep in with my approval or connivance."

CIVIL SERVICE COMMISSION. The civil service commission was reorganized by President Wilson. He retained Commissioner McIlhenny, who was made president of the commission, and appointed Charles H. Galloway of South Carolina, and Herman W. Craven of Washington, as successors to General Blake and Commissioner Washburn, whose resignation he accepted.

STATE AND MUNICIPAL CIVIL SERVICE. The record of progress of the civil service throughout the United States in 1913 was notable. Three States, California, Connecticut, and Ohio, passed civil service laws. In California and Connecticut, the law applies only to the State service, but in Ohio, in accordance with a constitutional provision adopted by a majority of over 100,000 in 1912, the law covers every city, county, and city school district, as well as the State service. In several cities, charters were adopted containing strong civil service provisions, and civil service commissions were established in Los Angeles County, and in the consolidated county and city government of Denver. In Elizabeth, N. J., the people adopted the provision of the State law by a majority of 16,067, and Detroit, Grand Rapids, and Houston, Texas, voted for the adoption of civil service amendments to local charters. An attempt made in the Illinois legislature to repeal the civil service law was defeated. Merit system appeals introduced in the legislatures of Texas, Michigan, and Minnesota failed to pass. See also **CIVIL SERVICE REFORM LEAGUE.**

CIVIL SERVICE COMMISSION. See **CIVIL SERVICE.**

CIVIL SERVICE REFORM LEAGUE, NATIONAL. The thirty-third annual meeting of the league was held in Boston, December 11 and 12, 1913. An address reviewing the progress of civil service during the year, and of the work of the league in this connection, was made by President Eliot. The league followed carefully the progress of the laws in Congress which related to the civil service, and it was largely through its efforts that certain obnoxious measures were defeated. (See **CIVIL SERVICE.**) In the resolutions adopted at the meeting, the league approved the recommendation made by the Postmaster-General that the merit system be extended to postmasters of the second and third class. It criticized President Wilson for his action in signing the bill which removed the deputy collectors and deputy marshals from the civil service. It also indirectly criticized the appointments of inexperienced men as ministers and ambassadors to foreign countries. Officers elected for 1913-14 were: President, Richard Henry Dana; vice-presidents, Edwin A. Alderman, Charles J. Bonaparte, Joseph H. Choate, Charles W. Eliot, Harry A. Garfield, George Gray, Arthur T. Hadley, Seth Low, Franklin MacVeagh, George A. Pope, Moorefield Storey, Thomas N. Strong, and Herbert Welch; chairman of the council, Robert D.

Jenks; secretary, Robert W. Belcher; and treasurer, A. S. Frissell.

CLARK UNIVERSITY. An institution established originally for post-graduate work in Worcester, Mass., in 1889. The collegiate department of Clark College is entirely independent in administration and endowment, although the same buildings are used for both the college and the university. The number of students enrolled in the university in the autumn of 1913 was 90. The faculty numbered 25. There were no notable changes in the faculty during the year and no noteworthy benefactions were received. The productive funds of the university amount to about \$2,400,000, and the income to about \$96,000. In the library are 65,000 volumes. In the college, the students numbered in the autumn of 1913, 161, and the instructors 24. The productive funds amounted to \$1,500,000, and the net income to about \$73,000. The president of the university is G. Stanley Hall, Ph. D., LL. D., and of the college, Edmund C. Sanford, Ph. D.

CLASSICAL PHILOLOGY. See **PHILOLOGY, CLASSICAL.**

CLAY-WORKING INDUSTRIES. Clay-working industries in the United States in 1912 showed considerable progress. The total value of all clay productions in that year was \$172,811,275, compared with \$162,236,281 in 1911; an increase of 6.5 per cent. Of the two great divisions of industry, brick and tile, and pottery, the former showed the larger increase, both actual and proportionate. The increase in the brick industry was \$8,589,490 or 6.7 per cent., while the increase in the pottery industry was \$1,985,004, or 5.75 per cent. The most important features in the industries in 1912 were the large increases in the value of architectural terra cotta, and also of the brick from the Hudson River region, the large decrease in drain-tile, and the excellent condition of the pottery industry. Ohio ranked first in the value of its clay products. In 1912 there were in that State 596 operating plants, and the value of the product was \$34,811,508. Pennsylvania ranked second, having 393 plants with an output valued at \$21,537,221—New Jersey, third, 155 plants, output valued at \$10,338,553—Illinois, fourth, 301 plants, output valued at \$15,215,990—New York, fifth, 219 plants, valued at \$12,056,858. All the States produce some form of clay products.

The value of common brick produced in 1912 was \$51,786,266. The vitrified brick was valued at \$10,931,575. Common brick is the most widely distributed of clay products. New York is the largest producer of common brick with Illinois second and Pennsylvania third.

The total value of pottery bricks in the United States in 1912 was \$36,504,164, with 434 plants in operation during the year. This was the largest value ever reported in any one year. Every product except stoneware and yellow and Rockingham ware showed an increase in 1912. The most important variety of pottery was white earthenware, the value of which in 1912 was \$14,829,431. Ohio ranked first in the production of pottery, with the total value in 1912 of \$15,508,735. New Jersey ranked second with the value of \$8,935,920; West Virginia third, with the value of \$3,165,366; New York fourth, with the value of 2,405,532. The pottery imported in the United States in 1912 was valued at \$9,555,530.

CLIMATE. See METEOROLOGY.

CLOAK AND SUIT INDUSTRY. See AB-
MITRATION AND CONCILIATION, INDUSTRIAL.

CLOTHING STRIKE. See STRIKES.

COAL. The production of coal in the United States in 1912 not only surpassed all previous tonnage records, but the average value per ton exceeded that of any normal year in the 33 years in which statistics are available. The total amount of coal produced in the United States in 1912 was 534,466,580 short tons, valued at \$695,606,071; compared with 496,371,126 short tons, valued at \$626,565,211 in 1911, a gain in quantity of 38,095,454 short tons, and in value of \$69,040,860. The increase in tonnage was entirely in the production of bituminous coal. The output of anthracite in Pennsylvania decreased from 80,771,488 long tons to 75,322,855 long tons, while the production of bituminous coal increased to 405,907,059 in 1912. The decreased production of anthracite in Pennsylvania was due entirely to the suspension of April and May, when practically the entire region was idle. Except for that period, the output of anthracite would undoubtedly have amounted to about 85,000,000 long tons or about 4,000,000 tons more than in 1911, the year of the greatest output. The factors which contributed to the increased output of bituminous coal were first, the revival of iron and steel industry, which stimulated production in the eastern States; second, the bumper crops of grain and other agricultural products which gave prosperity to the farming communities of the Middle West; third, the decreasing supplies of natural gas and fuel light in the mid-continent field, which have removed that competition from coal in the southwestern States; fourth, increased consumption by railroads, and in nearly all lines of manufacturing; fifth, activity in the mining and smelting of the precious and semi-precious metals in the Rocky Mountains and Pacific States. In spite of the increased production, there were fewer men employed in the bituminous mines in 1912 than in 1911. In some places this labor short-

age was due to the migration of miners on account of the Balkan war.

In 1912 coal was produced commercially in 30 States and in the Territory of Alaska. The table below, taken from the report of the United States Geological Survey, shows the coal production in the different States of the Union in 1911 and 1912.

MEN EMPLOYED. The total number of men employed in the coal mines in 1912 was 722,662, compared with 722,360 in 1911. The anthracite mines gave employment to 174,030 men, compared with 172,585 in 1911. In the bituminous mines 548,632 men were employed, compared with 549,775 in 1911. The average production per man in bituminous mines increased from 738 tons in 1911 to 820 tons in 1912. This was the highest average ever made. In the anthracite mines, the average yearly production of each employe was 484.8 tons in 1912, compared with 524 tons in 1911.

ACCIDENTS. Statistics compiled by the United States Bureau of Mines show that there was a marked decrease in the number of fatal accidents in the coal mines of the United States in 1912, as compared with fatal accidents in 1911-10. In 1912 the fatalities numbered 2360, compared with 2719 in 1911, and 2840 in 1910. Of the fatal accidents which occurred in 1912, 584 were in the anthracite mines of Pennsylvania, and 1776 in the bituminous and lignite mines of the country. As usual, the chief cause of death was falls of roof and coal; the deaths from that cause numbering 1451. There was a notable decrease in the number of fatalities due to explosions of gas and dust—from 371 in 1911 to 301 in 1912. The most serious explosion of gas in 1912 was in Oklahoma, where 73 men were killed in one disaster. In West Virginia were recorded the largest number of men killed by explosions of dust. These numbered 81. The death rate for 1000 employes in the anthracite region was 3.35. In the bituminous regions 3.24, and for the entire country, 3.38.

State	1912		1911	
	Quantity	Value	Quantity	Value

Grand total	534,466,580	\$695,606,071	496,371,126	\$626,565,211

LABOR TROUBLES. The second three-year extension of the awards of the anthracite Coal Strike Commission terminated March 31, 1912. There was a determination on the part of the miners to suspend work until certain modifications in the agreements were made. In consequence mining in the anthracite region was practically at a standstill from April 1 to May 15. It was nearly the first of June before the mines were in full operation. When mining was resumed in May, 1912, an additional advance of 10 per cent. in wages had been granted. In the anthracite region there were 151,958 men idle for an average of 45 days, and in the bituminous district the total number of men idle was 159,098, and the average time lost by each man was 35 days. With one exception, the labor disputes were not accompanied by disorder or bloodshed. This was the Paint and Cabin Creek mines of the Kanawha district of West Virginia, where for more than a year a condition bordering on warfare prevailed. (See STRIKES.)

WORLD PRODUCTION. The world production of coal at the latest dates available is shown in the table below.

1913 PRODUCTION. The coal production of the United States in 1913, according to the estimates of the United States Geological Survey was between 565,000,000 and 575,000,000 short tons, an increase over the record-breaking pro-

duction of 1912 of from 30,000,000 to 40,000,000 tons. The coal-mining industry during the year was normal and lacked any spectacular features. Of the increase, about 4,500,000 tons was in the production of anthracite and the rest in the production of bituminous coal mines. There were a few labor disturbances in 1913, but they were local in extent and effect. The most pronounced disaffection was in Illinois, where a general strike was called about the middle of September, and coal production in that State during the last quarter of the year was but little more than 50 per cent. of normal. There was general complaint particularly in the eastern States of a shortage of labor and inability on the part of operators to keep their mines working at full capacity. Coal mining, like all other industries in the Ohio Valley States was seriously interfered with by the flood in that region during the spring of 1913. The continued decrease in the production of fuel oil in the mid-continent field and the tract in the Colorado gold mines resulted in an increased output of coal in the southwestern States.

a Production of coal in Austria in 1912 amounted to 42,078,124 metric tons; 1913 figures for Hungary not available.

facturer, died January 17, 1913. He was born in 1834 and became, while still a young man, a director of J. & P. Coats. At the time of the Civil War, he took up his residence in New York, as America offered the best market for his product at the time. He returned to Scotland, but shortly afterwards removed again to the United States, where in Providence, R. I., and in Pawtucket, he erected many large mills, until an enormous plant was developed. In 1901 he returned to Scotland, but retained his directorship in the companies of which he was the head, until his death.

COCAINE AND MORPHINE HABIT.

Wilbert and Motter made careful research into the laws in several States having to do with the sale of opium, cocaine, and other narcotics. They found that, although in most States there existed laws which aimed to abolish drug addiction, there was a most extraordinary difference in the character and method of enforcement, in different parts of the country, of such laws. In some States the anti-narcotic enactments were so stringent and comprehensive as to make enforcement impracticable, while in other States the exceptions and provisos to the law resulted in its practical nullification. It was shown conclusively that the illegitimate use of opium and cocaine was steadily increasing and that lack of Federal control was the chief reason why the United States compared so unfavorably with European countries in the matter of drug addiction. Opium and its alkaloids were first separately enumerated in the tariff schedules in 1860, since which time there had been an increase of 351 per cent. in the amount of opium imported, as against an increase of 133 per cent. in population. Over 400,000 pounds of opium entered the United States annually during the last ten years. This amount is the more notable because it was stated, on reliable authority, that only one-eighth of this quantity was needed for medical purposes. Of the 300,000 pounds of morphine it was estimated that 80 per cent. was used by habitués. Austria-Hungary, with half the population of the United States, used only one-hundredth the amount of opium; and Germany, with sixty millions of inhabitants, consumed only 17,000 pounds. Italy used annually only 6000 pounds, with a population of thirty-three millions. The situation with regard to cocaine was equally serious. This drug was introduced in 1884. It is estimated that 150,000 ounces were used by habitués every year. (See Wilbert and Motter: "Digest of Laws and Regulations in Force in the United States Relating to the Possession, Use, Sale and Manufacture of Poisons

and Habit-Forming Drugs," *Public Health Bulletin No. 56.*)

A new cocaine bill was passed by the New York legislature in 1913, and its provisions were believed to be drastic enough to suppress the illegal traffic in that State. The bill made the illegal sale of the drug a felony, with a penalty of seven years' imprisonment. The possession of and traffic in flake cocaine were prohibited, and the drug was required to be traced from manufacturers to the druggist. The bill also limited the character of prescriptions which physicians may give, and prescribing the drug in crystalline form was prohibited. Furthermore, all druggists, physicians, and veterinarians must record their purchases and sales or disposition of cocaine, and drug stores were limited to the possession of five ounces at one time.

COCHIN-CHINA. One of the states (the southernmost) of the French colony of Indo-China (q.v.). The well-watered soil possesses a high degree of fertility; but the climate is well-nigh unsupportable, not so much on account of extreme heat as because the atmosphere remains saturated even through the dry season by evaporation from the numerous streams and pools. Rice is the main crop and constitutes 70 per cent. of the exports. The cultivation of pepper has developed in recent years. Irrigation and drainage are practiced. There is a cement factory, and the Chinese make pottery and bricks. Stock-raising and fishing are important. The trade is included with that of French Indo-China. The local budget for 1912 balanced at 7,321,817 piasters. The governor in 1913 was J. M. Gourbeil. The capital in Saigon. For history, see **FRENCH INDO-CHINA**.

COCHRANE, HENRY CLAY. An American soldier, died April 27, 1913. He was born in Chester, Pa., in 1842. In 1861 he was appointed to the United States naval service and served throughout the Civil War. He served also in the Spanish-American War, the Boxer campaign in China in 1900, and the campaign in the Philippine Islands. In 1900-01 he was governor of the province of Manzanillo, Philippine Islands. A regiment of marines in the Boxer War was under his command. He retired with the rank of brigadier-general in 1905.

COKE. The most significant feature of the coke making industry in 1912 as in 1911 was the progress shown in the construction of retort or by-product ovens, and the increase in the production of retort-oven coke. The number of retort ovens in operation increased from 4624 in 1911 to 5211 in 1912, a gain of 587; whereas the total number of all ovens decreased from 103,879 to 102,230.

The quantity of coke manufactured in 1912 amounted to 43,983,599 short tons, valued at \$111,736,696. The production for 1913 was estimated at 45,328,900 tons. The 1912 production was an increase of 8,432,110 short tons, or 23.7 per cent. in quantity, and of \$27,605,874 or 32.8 per cent. in value over 1911. The quantity of coal consumed in the manufacture of coke in 1912 was 65,577,862 short tons, valued at \$86,918,962. Of the 43,983,599 short tons of coke made in 1912, 32,868,435 tons were beehive or oven coke, valued at \$69,103,776, and 11,115,164 tons valued at \$42,632,930 were retort or by-

product coke. The average price per ton for oven coke in 1912 was \$2.10 against \$2.05 in 1911. The average price for retort coke was \$3.84 in 1912 as compared with \$3.48 in 1911. The total number of coke making establishments in 1912 was 559, compared with 570 in 1911.

Nearly all the States producing coke in 1912 showed an increased production. The quantities of increase ranged from 5005 tons in Georgia, to 5,514,758 tons in Pennsylvania. The largest percentage of increase was in Kentucky, the output in 1912 being nearly 190 per cent. more than in 1911. Pennsylvania ranked first in the production, with 27,438,693 tons. Alabama second, with 2,975,489, and Indiana third, with 2,616,339. In 1912 Indiana took the place of West Virginia as the third largest producing State. Other States producing in large quantities were Illinois, Colorado, Virginia, New York, Wisconsin, and Massachusetts. The following table shows the production of coke in the different States in 1911 and 1912:

State	Estab-lish-ments	1911		Coal used (short tons)	Yield of coal in coke (per cent.)	Coke produced (short tons)	Total value of coke	Price of coke per ton
		Built	Ovens Building					
Alabama	44	10,121	280	4,411,298	62.6	2,761,521	\$ 7,593,594	\$2.75

a Includes production of Utah.

The total amount of coke imported in the United States in 1912 was 123,614 short tons, valued at \$488,398. There were exported 912,576 short tons, valued at \$3,002,742. The imports in 1911 were 77,923 short tons, valued at \$254,455, and the exports 1,023,727 short tons, valued at \$3,215,990.

COLD STORAGE. See FOOD AND NUTRITION, MEAT PRODUCTION, and STOCK-RAISING.

COLE, AARON HODGMAN. An American biologist, author, and educator, died December 31, 1913. He was born in Greenwich, N. Y., in 1856, and graduated from Colgate University in 1889. He took post-graduate studies at Johns Hopkins University and the University of Chicago. In 1893 he was appointed lecturer in zoology at Cold Spring Harbor Biological Laboratory, and from 1895-6 was lecturer of biology in the University of Chicago Extension Division. From the latter year until his death he was instructor of biology in the Chicago Teachers' College. In addition to his work at these universities and colleges, he was from 1895 a popular lecturer on bacteriology. He developed many improvements in methods of showing microscopic objects in highly magnified form on screens, in connection with his lectures. He was also successful in producing anesthesia in animals used in a live state for zoological laboratory studies and when photographed. He wrote considerably for scientific journals, and was the author of *Manual of Biological Projection and Anesthesia of Animals* (1907).

COLGATE UNIVERSITY. An institution of higher education, founded at Hamilton, N. Y., in 1819. The students enrolled in all departments in the college were 200. The faculty numbered 46. An associate professor of economics was appointed in 1913, and there were other additions to the faculty. There were no noteworthy benefactions received during the year. The productive funds of the college amount to about \$2,000,000 and the income to about \$150,000. The library contains about 61,000 volumes. The president is Elmer Burritt Bryan.

COLLEGES. See UNIVERSITIES AND COLLEGES.

COLLEGES, AGRICULTURAL. See AGRICULTURAL EDUCATION.

COLLIER, PRICE. An American writer, died November 3, 1913. He was born in 1860, and received his early education in Geneva, Switzerland, and Leipzig, Germany. In 1882 he graduated from Harvard University, and later he entered the ministry of the Unitarian Church. During the Spanish-American war he acted as an officer in the United States navy. Most of his later years were spent in traveling and writing. He devoted himself especially to the study of European countries and their problems. The result of these studies is: *England and*

b Production included with Colorado.

the English from an American Point of View (1909); *The West and the East from an American Point of View* (1911); *Germany and the Germans* (1912). The books on England and Germany are notable for their frankness and acumen. Mr. Collier died in Copenhagen, while engaged in collecting material for a book on Scandinavia. In addition to the books mentioned above, he published a volume of essays entitled *Mr. Picket Pin and his Friends; America and the Americans from a French Point of View*; and *A Parish of Two* (1903). He also contributed to magazines and periodicals.

COLLISIONS. See RAILWAY ACCIDENTS.

COLOMBIA. A northwestern republic of South America. The capital is Bogotá.

AREA, POPULATION, ETC. The population by departments, etc., according to the census of March 5, 1912, is as follows:

	Sq. km.	Pop.	Capitals
Departments:			
Antioquia.....	72,000	740,937	Medellin
Atlántico.....	2,600	114,887	Barranquilla
Bolívar.....	66,865	420,730	Cartagena
Boyacá.....	8,630	586,499	Tunja
Caldas.....	8,500	341,198	Manizales
Cauca.....	24,975	211,756	Popayán
Cundinamarca.	22,350	713,968	Bogotá
Hulla.....	23,000	158,191	Neiva
Magdalena.....	49,400	149,547	Santa Marta
Nariño.....	30,000	292,535	Pasto
Norte de San- tander.....	20,000	204,381	Cúcuta
Santander.....	44,270	400,084	Bucaramanga
Tolima.....	23,800	282,426	Ibaqué
Valle del Cauca	28,000	217,159	Call
Intendencias:			
Meta.....	29,309	Villa Vicencio
Chocó.....	68,127	Quibdó
Commissaries:			
La Guajira....	53,013	Puerto Estrella
Arauca.....	4,922	Arauca
Caquetá.....	24,543	Florencia
Putumayo.....	31,380	Mococa
Vaupés.....	5,545	Calamar

Juradó.....	8,207	Pisarro
Lazarettos...	6,793	
Colombia.	1,206,200	5,072,604	Bogotá

The figures given above for the departmental area are only approximate. The total area is unknown and it cannot even be calculated with any degree of accuracy on account of the unsettled boundaries in the southeast; the boundary with Brazil is still undefined, and a considerable region is claimed not only by Colombia but by both Ecuador and Peru. This region includes the Putumayo district, notorious for the atrocities inflicted on the native rubber gatherers; and in attempting to force Peru to end these atrocities the United States and Great Britain evidently recognized the Peruvian claim to the territory. The total area given in the table above, 1,206,200 square kilometers, corresponds to 465,700 square miles; another estimate,

probably more nearly accurate, is 435,100 square miles. The total population as returned by the census of 1912 was 5,472,604; but this figure includes an estimate of 400,000 for Panama, whose independence Colombia has not recognized. On the other hand, it does not include a considerable number of uncivilized Indians; their number is quite unknown, but has been surmised to be about 30,000. The larger towns, according to the 1912 census, include the following (the figures relate to *municipios*, that is, districts which are organized for municipal purposes and which usually include a rather extended rural area): Bogotá, 121,257; Medellín, 71,004; Barranquilla, 48,907; Cartagena, 36,632; Manizales, 34,720; Sonsón, 29,346; Pasto, 27,760; Cali, 27,747; Aguadas, 26,423; Ibagué, 24,693; Palmira, 24,312; Neiva, 21,852; Montería, 21,521; Yarumal, 21,250; Cúcuta, 20,364; Bucaramanga, 19,735; Miraflores (Boyacá), 19,150; Loricá, 19,006; Popayán, 18,724; Cartago, 18,618; Pereira, 18,428; Andes, 18,391; Salamina, 18,195; Fredonia, 18,176; Bolívar (Cauca), 17,738; Abejorral, 17,508; Santa Rosa de Cabal, 17,009. Ocaña, 16,814; Riosucio, 16,506; Carmen, 16,332; Espinal, 16,274; Libano, 16,186; Sabanalarga, 16,042; Quibdó, 15,756.

Primary instruction is gratuitous, but not compulsory. Number of primary schools reported, 4075, with 292,058 pupils. Secondary education is directed largely by the religious orders. There are over 20 normal schools and a few establishments for professional education. The state religion is Roman Catholicism.

INDUSTRIES AND COMMERCE. Agriculture and mining are both important in the economic development of Colombia, and in some parts of the country cattle-raising is a large and profitable industry. The leading products of the soil include bananas, coffee, cacao, sugar-cane, cotton, tobacco, rubber, and cereals. The mineral resources are large, especially in Antioquia, including gold, copper, lead, zinc, mercury, iron, platinum, salt, and emeralds. Manufactures, except Panama hats, are little developed.

Imports and exports have been valued as follows:

	1909	1910	1911	1912
Imps..	\$12,117,927	\$17,025,637	\$18,108,863	\$23,964,623
Exps..	16,040,198	17,625,153	23,375,900	32,221,746

Leading imports in 1912: Textiles, \$10,547,134; foodstuffs and condiments, \$3,054,953; metals, \$2,916,925; railway cars, wagons, carriages, etc., \$1,031,711; drugs and medicines, \$838,340; liquors and other beverages, \$835,772. The principal exports in 1911 and 1912 respectively were: Coffee, \$9,475,449 and \$16,777,908; bananas, \$2,172,000 and \$1,996,999; gold in bars and gold dust, \$3,751,632 and \$4,610,073; cattle hides, \$1,779,790 and \$2,261,722; Panama hats, \$1,088,821 and \$1,174,641; rubber, \$900,887 and \$736,427; ivory nuts, \$739,419 and \$754,708; platinum, \$345,897 and \$594,188; leaf tobacco, \$332,935 and \$442,461.

Trade by countries, in thousands of dollars:

	Imports		Exports	
	1911	1912	1911	1912
United Kingdom....	5,839	7,839	4,596	4,376
United States.....	5,405	7,612	12,249	15,833
Germany	3,243	4,201	1,910	1,854
France		597	769	625
Italy		571		
Belgium	398	477		
Spain		83	120	308
Total, incl. others ..	18,109	23,965	22,376	32,223

In 1912 the port of Barranquilla received imports and sent exports to the value of \$12,445,532 and \$12,231,609 respectively; Cartagena, \$5,084,307 and \$6,665,159; Buenaventura, \$3,839,771 and \$1,342,967; Tumaco, \$1,171,373 and \$1,417,153; Cúcuta, \$768,468 and \$2,992,918; Riohacha, \$68,690 and \$4,861,512.

COMMUNICATIONS. The railways form no continuous system, but consist of various short lines engaged in local traffic. Recent statistics are not available; the total length in operation at the end of 1911 was reported at 1000 kilometers. There was some railway construction during 1912 and 1913. Telegraphs, over 19,000 kilometers of lines; post offices, over 600.

FINANCE. The gold dollar, or peso, is equivalent to the United States dollar, the silver peso fluctuates with the price of silver, and the paper peso is legally current at one cent. Budgets have been as follows: 1910, revenue \$10,831,500 and expenditure \$10,831,500; 1911, \$12,685,119 and \$12,685,119; 1912, \$12,043,145 and \$12,500,000; 1913, \$14,070,654 and \$14,060,294. Of the estimated revenue for 1913, customs were credited with \$10,050,370. The larger estimated expenditures were for war, \$3,285,032; public debt, \$3,015,986; interior, \$1,294,572; finances, \$1,063,432; and justice, \$1,039,999. Public debt: Foreign consolidated (January 1, 1912), £2,486,000 (in addition, guarantee railway debts amounting to £1,469,400); internal (July 1, 1912), 5,476,888 pesos silver; floating, \$2,756,545. In addition, there is an enormous outstanding paper currency.

ARMY. Nominally military service is compulsory under the laws of 1897 and 1911, but is not enforced, and a force consisting of about 350 officers, 159 officials, 218 musicians, and 5500 men is the peace effective strength which, in time of war, it was estimated could be raised to a force of 50,000 men. The troops consist of 12 regiments of infantry, three divisions of cavalry, three divisions of artillery each with two four-gun batteries, one battalion of engineers, and one battalion of train. The military school, with a course of four years, is maintained for officers at Bogotá.

GOVERNMENT. The executive authority is vested in a president, who is elected by the Congress for a term of four years and is assisted by a cabinet of seven ministers. The Congress consists of the Senate (35 members, elected indirectly for four years) and the House of Representatives (92 members, elected for four years by direct vote). The president in 1913 was Carlos E. Restrepo, who was inaugurated, August 7, 1910. The Congress annually elects two *designados* (vice-presidents); in the autumn of 1913 it reflected Marco Fidel Suárez as first *designado* and elected Jorge Holguín as second.

HISTORY. The National Congress opened its session on July 20, the anniversary of independence, and elected the following officers: president of the Senate, Dr. José Vicente Costa; president of the House, General Marcelino Vélez; first *designado* to the presidency, Sr. Jorge Holguín. Three subjects of primary importance confronted the Congress: the budget, oil and bank concessions, and relations with the United States. The budget as presented in the message of President Restrepo, covered an expenditure of \$16,115,000 with a surplus of \$385,000. It included the increased salary of the president, now \$18,000, instead of \$9,600. The disapproval by Congress of

a proposed new tariff made it impossible to settle the financial arrangements for the year.

Great interest centred in the oil sessions granted tentatively by the government to a British syndicate, S. Pearson and Son, Ltd. The contract arranged by Lord Murray of Elibank, who represented the Pearson company, had as its object the development of the petroleum industry in Colombia; but its terms were so liberal that, in the United States at least, many fears were expressed lest the British firm should be allowed to gain a monopoly of Colombian oil-fields. It was alleged also that the British *cessionnaires*, possessing the right to construct and operate railroads, to build wharves, to establish communications, and to take up lands (not to exceed 10,000 square kilometers) anywhere in the republic, might establish a line of communications that would compete with the Panama Canal in interoceanic traffic. The Colombian Congress delayed its approval of the concession, and late in November, Lord Murray withdrew his proposals, probably on account of adverse American criticism. Nevertheless, a contract was entered into between the government and Pearson and Son for a survey of the port of Buenaventura on the Pacific coast, with a view to harbor improvements; and it was prophesied that the projected concession would be revived in 1914.

The third centre of interest was the long-standing dispute with the United States over the independence of Panama. The United States had never been forgiven for recognizing the independence of that insurgent province; and an almost undiminished bitterness of resentment was shown when the Colombian Congress met on November 4, 1913 (the decennial anniversary of Panama's declaration of independence) and unanimously adopted a resolution affirming the imprescriptibility of Colombia's isthmian rights. It was added, that Colombia would welcome a sincere proposal for an amicable and honorable settlement of her claims. As to what that settlement might be, opinion differed. *La Tribuna*, a leading Bogotá journal, laid down five indispensable conditions for such an adjustment: (1) the rendition of moral satisfaction or reparation to Colombia by the United States; (2) the imposition of identical conditions upon American and Colombian shipping in the canal; (3) the establishment of a line between Colombia and Panama, as in 1855; (4) the payment of \$20,000,000 for Colombia's rights in the Panama Railway; (5) the establishment of friendly relations between the two republics. That such conditions would ever be granted by the United States seemed highly improbable. In Colombia, however, a spirit of bitter defiance was dominant. It was very well expressed in the fact that Colombia's consuls were forbidden to take part in any receptions given to ex-President Roosevelt on his South-American trip.

Several occurrences of minor interest deserve mention. A new fiscal code was published in the *Official Gazette* of March 4, 1913, a penal colony was established in Magdalena, the government had under discussion measures to encourage immigration. By the authorization of Congress, the government appointed a commission to begin the survey for a railway between the Putumayo River and the Pacific Ocean. Authorization was also granted for a railway connecting the Magdalena River with the town of San José de Cúcuta, in the department of San-

tander, thus completing the transcontinental chain of river and railway connections.

COLON. See PANAMA CANAL.

COLORADO. POPULATION. The population of the State in 1910 was 799,024. According to the report of the Bureau of the Census, made in 1913, the population was 883,276.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1913 are estimates only:

		Acreage	Prod. Bu.	Value
Corn	1913	420,000	6,300,000	\$4,599,000
	1912	420,000	8,736,000	4,368,000
Wheat	1913	460,000	9,680,000	7,551,000
	1912	453,000	10,968,000	8,006,000
Oats	1913	305,000	10,675,000	4,697,000
	1912	290,000	12,412,000	4,717,000
Rye	1913	20,000	340,000	204,000
	1912	25,000	488,000	268,000
Potatoes	1913	80,000	9,200,000	5,980,000
	1912	85,000	8,075,000	3,311,000
Hay	1913	890,000	11,824,000	18,240,000
	1912	870,000	1,905,000	16,574,000

c Tons.

MINERAL PRODUCTION. The total value of the metallic mineral production of the State in 1913 was estimated by the United States Geological Survey at \$36,200,000, compared with \$37,320,996 in 1912. The production of gold was estimated at \$18,395,000; silver, 9,150,000 ounces; lead, 85,000 pounds; copper, 7,634,000 pounds; and zinc, 129,680,000 pounds. This was a decrease of \$200,000 in gold; an increase of 900,000 ounces in silver; an increase of 10,300,000 pounds of lead, an increase of 500,000 pounds of copper, and a decrease of 2,540,000 pounds in zinc. The heaviest decrease in value was 1,632,000 pounds for zinc. The output of Cripple Creek showed an increase of \$176,600 in gold. The value of the Leadville district slightly declined in 1913. Other districts showed increases. The total value of all mineral products of the State in 1912 was \$58,167,399, compared with \$52,522,416 in 1911.

The gold production in 1912 was valued at \$18,588,562, compared with \$19,001,975 in 1911. Of the total amount, the Cripple Creek district produced \$11,808,392, an increase of \$445,709 over the production of 1911. The San Juan region produced \$4,119,191 in 1912, compared with \$5,035,610 in 1911. The production of placer gold was \$423,825, compared with \$319,759 in 1911. The greatest part of the placer output was from Summit County. The silver production of the State in 1912 was 8,212,721 ounces, compared with 7,330,178 ounces in 1911. Lake County, which comprises chiefly the Leadville district, showed a decrease of 6899 ounces in 1912. Dry or siliceous ores yielded 5,397,439 ounces in 1912, lead ores, 1,470,930. Lead zinc ores, 594,427, copper lead ores, 389,449, copper ores, 224,327, and zinc ores, 130,392. In 1912, 7,963,520 pounds of blister copper were produced, as compared with 9,791,861 pounds in 1911. Although the State has no important producing district in which copper is the principal metal, it ranked tenth among the copper producing States in 1912. The main production is derived from the treatment of mixed ores in which copper is of minor importance. These include lead-silver ores and pyritic ores, rich in gold and silver. Leadville and the San Juan-Ouray districts are the chief producers of copper.

Much of the output is recovered as matte in lead furnaces.

The value of the clay products of the State in 1912 was \$1,437,394, a decrease of \$165,315 in 1911. The principal clay product was common brick, which was valued at \$407,128 in 1912.

Petroleum resources of considerable promise are as yet practically undeveloped. Actual production comes from the Florence fields in Fremont County, and the Boulder field in Boulder County. The total production in 1912 was 206,052 barrels. Of this 190,498 barrels were taken from Florence County fields. The production in 1911 was 226,926 barrels.

The total production of coal in Colorado in 1912 was 10,977,824 short tons, valued at \$16,345,336. Colorado is by far the most important coal producing State west of the Mississippi River, and ranks seventh among all the States in the production. The coal mined in 1912 was an increase of 820,441 tons over that produced in 1911, but was still nearly a million tons short of the output in 1910, when the maximum output was recorded. Coal mining in 1912 was hampered by labor shortage. There was a decrease of over 1300 in the average number of men employed as compared with 1911. In the earlier year the number of men reported was 14,316, while in 1912 it was 13,000. The coal production of the State in 1913 was approximately 1,500,000 tons less than that of 1912. This was due to the strike in the Colorado fields which went into effect on September 23, and resulted in a production of 50 to 60 per cent. in the remainder of the year. According to the United States Bureau of Mines, there was a total of 95 deaths in the coal mines in the State in 1912, an increase of 4 over 1911. Falls of roof and coal were responsible for 50 deaths. Explosions by burn or gas killed 15 men and holage accidents 14. In all there were 91 deaths underground, 2 in the shafts, and 2 on the surface. The coal mining industry was free from labor troubles in 1912.

COMMUNICATIONS. The total railway mileage of the State on January 1, 1913, was 5653, of which 4350 was standard gauge, and 1302 was narrow gauge. The longest mileage, 970, is that of the Denver and Rio Grande. The Atchison, Topeka, and Santa Fé had 512, the Chicago, Birmingham and Quincy, 394, the Colorado and Southern, 387, the Union Pacific, 590. Nearly all the other lines were local.

EDUCATION. The total school population of the State in 1912, between the ages of six and twenty, was 227,187. The total enrollment was 127,428. In the high schools of the State were enrolled 16,377 pupils, and in the graded schools below high schools, 112,582. The average monthly salary for male teachers was \$142.49, and for female teachers, \$69.01.

FINANCE. The receipts from all sources for the fiscal year 1913, amounted to \$3,580,445, and the disbursements for the same period \$3,837,423. The chief sources of revenue are from general taxes and from fees. The chief expenditures are for the maintenance of State institutions and government. The bonded debt of the State amounts to \$3,250,000.

CHARITIES AND CORRECTIONS. The charitable corrections of the State with their populations in 1913 are the following: State Home for Children, 233; Soldiers' and Sailors' Home, 153; Workshop for the Blind, 717; the State Hospital

for the Insane, 590; State Home for Mental Defectives, 63; Boys' Industrial School, 315; Girls' Industrial School, 115; State penitentiary, 759; State reformatory, 81. For the maintenance of these institutions, the general assembly in 1913 appropriated \$882,000, and for improvements, \$95,500. This legislature enacted several bills relating to the work of charities and corrections. Among them the regulation of the sale of cocaine, registering of tuberculars, and the forbidding the publication of trial, etc., where children are involved. At the general election of 1912, through the operation of the referendum, a mothers' compensation act, an act providing for a more extended civil service, and an act limiting the hours of work for women were passed. In 1913 a home for the blind and an international white slave association were established at Denver.

POLITICS AND GOVERNMENT. The State legislature met in 1913, and passed several important measures, which are noted in the section *Legislation* below. Many of these measures were the result of referendum vote cast in 1912. The term of the governor expires on January, 1915, and the next election for State officers is November 3, 1914. The death of Senator Charles J. Hughes in 1912, and the decision of Senator Guggenheim not to be a candidate another term in the Senate, made it necessary for the legislature to elect two senators in January. Accordingly, on January 14, former Gov. F. Shafroth was elected to succeed Senator Guggenheim, and Charles S. Thomas, a former governor of the State, was elected to serve for the unexpired term of Senator Hughes. Governor Ammons was inaugurated on the same date.

The income tax bill, passed by the legislature, was vetoed by Governor Ammons on May 16. The State was troubled by a series of serious coal strikes in the latter part of the year. (For an account of these disturbances, see *STRIKES*.) On December 1, a Federal grand jury at Pueblo, indicted President White and twenty-four other officials of the United Mine Workers, on charges of obtaining a monopoly of labor, and restraining trade by conducting a strike.

LEGISLATION. The legislature was in session in 1913 and several important measures were passed. Many of these were acts to bring into effect the direct legislation of November, 1912, by means of the initiative and referendum. The most notable of these laws were those providing for home rule in local and municipal matters, for the recall of all elective officers, including judges, and for the recall of certain judicial decisions. These were all initiated and were all constitutional amendments. Initiated statutes carried in the election of 1912 were the parents' pension act, a headless ballot, the civil service act, and an act providing for eight-hour laws for women and underground workers. In addition to these measures the legislature passed a loan-shark law, which follows closely the measure passed by Congress to regulate practices in the District of Columbia, the anti-trust act, an act directing the Supreme Court to prescribe rules of practice and procedure in all courts of record (which rules shall supersede in statute any that conflict therewith), an employers' liability act, and a commission to regulate the minimum wage for women and minors. A measure was also passed creating a public utilities commission. See also *LIQUOR REGULATION*.

STATE GOVERNMENT. Governor, Elias M. Ammons; Lieut.-Governor, Stephen R. Fitzgerald; Secretary of State, James B. Pearce; Treasurer, M. A. Leddy; Auditor, Roady Kenahan; Adjutant-General, John Chase; Attorney-General, J. Fred Farrar; Superintendent of Public Instruction, Mary C. C. Bradford—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Geo. W. Musser, Dem.; Justices, S. H. White, Dem.; W. A. Hill, Dem.; M. S. Bailey, Dem.; William H. Gabbert, Rep.; Tully Scott, Dem.; James E. Garrigues, Rep.; Clerk, James R. Killian, Dem.

STATE LEGISLATURE, 1913. Democrats: Senate, 24; House, 48; joint ballot, 72. Republicans: Senate, 11; House, 17; joint ballot, 28. Democratic majority: Senate, 13; House, 31; joint ballot, 44.

The State representatives in Congress will be found in the article **UNITED STATES**, section *Congress*.

COLORADO, UNIVERSITY OF. A State institution of higher learning, founded at Boulder, in 1876. The students enrolled in the several departments of the university in the autumn of 1913, were as follows: Arts, 739; engineering, 305; medical, 49; pharmacy, 20; law, 77; graduate, 60. The faculty numbered 200. The most notable event in the history of the university during the year was the resignation of James S. Baker as president, and the election of Dr. Livingston Farrand (q.v.) as his successor. The college received from Charles Inglis \$75,000 to establish the Thomson professorship of law. The annual income is about \$305,000. The library contains 75,000 volumes.

COLUMBIA, DISTRICT OF. See **DISTRICT OF COLUMBIA**.

COLUMBIA UNIVERSITY. An institution of higher learning, founded in New York City, in 1754. The total number of students enrolled in all departments in the autumn of 1913 was 13,573. The faculty numbered 999. In 1913 the schools of mines, engineering, and chemistry were changed to a graduate school. Several noteworthy benefactions were received during the year. Among these were gifts of \$450,000 from the estate of Joseph Pulitzer, of \$250,000 from the estate of Francis Furnald, and of \$67,642 from the estate of John S. Kennedy. The volumes in the library were about 500,000. The productive funds amount to about \$8,700,000, and the annual income is about \$1,750,000. The president is Nicholas Murray Butler, LL. D.

COMPTON, ALFRED GEORGE. An American mathematician and educator, died December 11, 1913. He was born in London, England, in 1835, and came to America with his parents in 1842. He entered the City College of New York in 1849, the year of its foundation, and was a member of the first graduating class. After his graduation, he was appointed a teacher in the College of the City of New York, which was then known as the Free Academy. He remained with this institution from that time until his retirement in 1911. During the entire period he was a teacher of mathematics, and from 1902 was professor of physics. From December, 1902, to September, 1903, he was acting president of the college. He was the author of *A Manual of Logarithmic Computations* (1891); *First Lessons in Wood-Working* (1880); *First Lessons in Metal-Working* (1890); *Some Common Errors of Speech* (1898). The mechanical arts building of the college received the name of Compton Hall in honor of Dr. Compton.

CONCILIATION, INDUSTRIAL. See **ARBITRATION AND CONCILIATION, INDUSTRIAL; and STRIKES**.

CONCRETE. The uses of concrete and reinforced concrete in the year 1913 were extended and as this material enters into so many developments of engineering construction the notable structures in which it is employed might properly be discussed under separate heads. The great dam at Keokuk, Iowa, across the Mississippi, and the plant of the Mississippi River Power Company at that point, discussed in previous issues of the **YEAR BOOK**, are notable examples of work completed during the year, and the use of Tufa cement in the Los Angeles aqueduct, and of Portland cement in the Catskill aqueduct, are important instances in another field. A notable reinforced concrete building was being planned during the year for the new Massachusetts Institute of Technology, on the banks of the Charles River at Cambridge. The main building was to have some 850,000 square feet of floor area and require more than 50,000 cubic yards of concrete. It was to be composed of about 16 divisions, each of which was stated to be large enough to form a complete building in itself. Mention also might be made of the progress on the Arrowrock dam on the Boise River, Idaho, a reinforced concrete structure 351 feet in height, and of the completion of the concrete locks of the Panama Canal. The casting in concrete of groups of small houses for working men progressed during the year and for plain and similar structures economical in original cost and maintenance was found to be very satisfactory. Important groups of such buildings were erected in Nanticoke, Pa., and Oklahoma, while in France and Ireland much attention was paid to the subject. In Ireland it was stated that 30,000 of these houses were built in the last three years. Increased interest during the year was aroused in the use of concrete in road building. Its application to the wearing surface of roads, as well as to the foundations for pavements, already had been developed, and was being watched with considerable interest; but in this field, as with other uses of concrete, improper construction had its effect and well defined rules

and specifications were developed to insure the proper construction of such highways. During the year there were the usual number of failures of concrete buildings due in the main to ignorance and failure to observe proper conditions of construction, and much attention was paid to full sized tests and examinations, as well as experiments with various structures. See CEMENT.

CONDENSED MILK. See DAIRYING.

CONGO, BELGIAN. Formerly the Congo Free State. The capital is Boma (Bas-Congo). The statistics cited in this article are those of the Belgian colonial minister.

AREA AND POPULATION. The area of the colony is 2,365,000 square kilometers (913,127 square miles), and the frontier measures 9165 kilometers. Area by districts, with chief town in district: Bas-Congo, 40,110 sq. kms. (Boma); Moyen-Congo, 54,990 (Léopoldville); Kwango, 141,710 (Bandundu); Lac Léopold II., 127,950 (Inongo); Equateur, 243,310 (Coquilhatville); Bangala, 128,910 (Lisala); Ubangi, 60,270 (Libenge); Uele, 219,790 (Niagara); Aruwimi, 66,190 (Basoko); Stanleyville, 436,430 (Stanleyville); Kasai, 365,230 (Lusambo); and the vice-government-general of Katatango, 460,110 sq. kms., with these divisions—Lomami (Kabinda), Tangawika-Moero (Kongolo), Haut-Luapula (Elizabethville), and Lua-la (Kafakumba). By a decree of March 28, 1912, a reorganization was effected into 22 districts, the boundaries and areas of which are not at present available. The whites in the colony, January 1, 1912, numbered 5465 (3307 Belgians). Unofficial estimates of the native population vary from nine to twenty millions.

LAND SALES. It is reported that the sales of crown lands in 1911 were 35 in Katanga and 21 in other districts: 31 in Katanga (15 in other districts) within urban circumscriptions, total selling price 265,357.96 (99,592) francs; 4 (1) suburban, 18,750 (250) francs; 5 factory sites, 7500 francs. Rented lands covered about 110 hectares in Katanga (117 in other districts) and the total rental was 85,017 (27,419) francs.

PRODUCTION. The country is entirely undeveloped. Indigenous products gathered for export are shown in the section on trade below.

COMMERCE. The total general trade appears below for five consecutive years, values in thousands of francs:

	1907	1908	1909	1910	1911
Imports.....	33,437	32,271	28,482	43,979	58,385
Exports*.....	77,541	56,867	78,014	95,599	78,955

* Rubber, 1911, 50,424,000 francs (76,030,000 in 1910); Ivory, 9,237,000 (9,361,000); palm oil, 2,032,000 (2,916,000); palm nuts, 3,504,000 (3,101,000); "other products," 13,758,000 (5,091,000).

In the special trade the 1911 imports were valued at 48,632,877 francs; 1910, 36,846,508. The details of its imports are often significant, viewed in conjunction with its production, of a country's degree of civilization and rate of progress. Especially is this the case with the Belgian Congo, a country whose native working population is almost exclusively engaged in the gathering of rubber—an article not of consumption, but of export—and other forest products. Yet compare the import of food-stuffs in 1911 (9,248,000 francs, total general) with the export of rubber (50,424,000 francs). Compare

also the imports in detail of the special trade: 297,812 francs for guns (652,772 in 1910), 672,369 for pistols and ammunition, 451,270 for powder, explosives, etc.; the last importation of cannon was 1906-9—13,380 fr.; steamers, machinery, anchors and chains, parts, etc., for boats, 1,920,838 fr.; locomotives and parts, telephone, telegraph, and electrical apparatus, etc., 8,050,223; metals (sheet iron, nails, wire, rails, beams, bars, etc.), 2,964,137; scientific and other instruments, 478,815; books, registers, paper, and office furnishings, 740,359. Of the foregoing there is little suited for native use; there are no agricultural implements recorded. It is unlikely that wine to the amount of 1,666,635 francs, beer, 898,373; liquors, 488,139, were intended wholly for native consumption. Construction material 1,235,601 francs, musical instruments 125,402; chemical products 207,592, pharmaceutical products 516,054, coal and coke, wood, haberdashery and perfumery may be for the use of the natives or they may be for the use of resident white exploiters of the natives. There are 3,117,344 francs for lingerie and other garments. Outside of mules and asses 85,822 francs, horses 15,540 francs, and forage for these and other animals 13,756 francs, there entered cattle 320,721 francs, sheep 20,730 francs, swine, 1125 francs, other animals 6658 francs; of these some were probably for native consumption, some for the resident whites. The same may be said of foodstuffs (fish, cereals and cereal products, sugar, potatoes, etc.) to the amount of 7,554,501 francs; soap, tobacco, and oils, including petroleum. Textiles, including velvets, silks, carpets, etc., as well as bagging and tarpaulins, were valued at 8,621,263 francs; of these the prints and other cottons were no doubt destined largely for native use, as were certainly 1,971,272 francs' worth of iron and copper bracelets, mirrors, and other "quincaillerie" ("ironmongery, trash, gimcracks"). Spirituous liquors valued at 324,344 francs were imported for barter with the natives. Place against these imports the principal articles of export—all or nearly all the product of native labor: 34,426,896 francs rubber, ivory 5,683,468, raw gold 3,119,050, white copal 3,348,317, palm kernels 2,878,674, palm oil 1,731,898, raw copper 1,834,041; total exports, 54,052,426 francs (66,802,295 francs in 1910). If the producer is paid a fair price for his product, it is reasonable to assume that the nine to twenty native millions of the Belgian Congo are accumulating considerable fortunes. Otherwise the seemingly favorable balance of trade assumes a significantly vicious aspect from the economic standpoint.

Preliminary figures for the 1912 trade give imports general 59,424,000, special 49,715,000; exports general 78,923,000, special 54,021,000.

Of the total imports in the special trade in 1911 (48,632,877 francs), goods valued at 31,435,138 francs came from Belgium; of the exports (54,052,427), 47,566,266 went to Belgium, 3,413,896 to Angola. At Boma (1911), 207 vessels, of 445,319 tons entered; at Banana, 262, of 379,513 tons.

RAILWAYS. Lines, with holdings, in operation January 1, 1912: Congo Railway Company, 400 kilometers; Stanleyville-Ponthierville, 125; Kindu-Kongolo, 355; Lualaba-Tanganyika (271 kilometers under construction); Katanga Railway Company—Rhodesian frontier to Elizabethville, 262 (total line 275), and Elizabethville

to Bukama, 163 (under construction); Boma to la Lukula, 80; la Lukula to Thela, 56 (under construction). During 1913 preliminary work for the extension of the Elizabethville-Kambove railway towards Bukama was being undertaken and actual construction was in progress. A survey was being made for the Lower Congo Katanga railway, 1100 miles in length, so that construction work could be started. This line would join the Cape-to-Cairo at Bukama. The Congo-Tanganyika railway from Kabalo to the lake was approaching completion and little remained but laying the rails for a few miles.

During the year it was announced that the Kambove-Djilongo section of the Katanga Railway was under construction and that a contract had been awarded for 150 miles further on to Bukama, where it would join the Cape-to-Cairo line. Kambove hitherto had been reached from Broken Hill so that the railroad distance from Cape Town towards the interior of Africa was 2420 miles.

FINANCE AND GOVERNMENT. In the table below are shown revenue and expenditure for four years, 1911 and 1912 being budget estimates (thousands of francs):

	1909	1910	1911	1912
Revenue.....	34,570	33,517	40,870	45,368
Expenditure.....	34,470	40,371	*59,658	†66,539

* Including 12,222,443 francs extraordinary.
† 18,618,660 francs extraordinary.

The receipts from rubber sales in 1912 were estimated at 13,210,369 francs; from state domains, tribute, and taxes in kind, 8,317,220; direct taxes, 7,216,000; customs, 7,069,000; mines, 3,420,000, etc. Expenses for administration amounted to 9,384,400 francs; for troops and police, 8,762,700; interest and charge, 7,807,885; marine, 3,727,800; posts, telegraphs, etc., 2,396,510; etc. The debt stood (1912) at 141,222,200 francs.

A governor-general administers the colony (1913, F. Fuchs). A commissioner is at the head of each district. In consequence of failure to carry out promised reforms in the matter of exploitation of the natives, Great Britain has so far withheld recognition of the annexation of the Congo by Belgium.

HISTORY. British recognition of the Belgian annexation of the Congo Free State was long delayed on account of the mistreatment of the native under the Belgian régime. In April, 1913, however, the (British) Congo Reform Association, which was formed for the purpose of protecting the natives from expropriation and oppression, reported that the liberties of the natives were now secure, that the rubber tax had been abolished and freedom of the trade established, that the concessionary companies had been deprived of their dangerous prerogatives, and that no obstacle longer existed to recognition of the Belgian annexation. The suggestion met with official approval, and on May 29 Sir Edward Grey was able to report it to the British House of Commons. The Catholic missionaries in Belgian Congo protested frequently during the year that their freedom was being violated. It seems that certain officials had shown themselves unfriendly and unfair in their attitude towards the missions.

CONGO, FRENCH. A former name for French Equatorial Africa (q.v.).

CONGO FREE STATE. See CONGO, BELGIAN.

CONGREGATIONALISM. At the national council, held in Kansas City, Mo., October 22-31, 1913, the commission of nineteen appointed at the preceding memorial council in Boston, in 1910, presented an entirely new scheme in organization. A new constitution was adopted, when the old order passed away. The autonomy of the local church is maintained, and fellowship has been made to be more compact and purposeful. A larger range of service was granted to the general secretary, and the several benevolent societies had been requested to submit to the advisory direction of a commission on missions, the object being to prevent duplication of activities, to effect all possible economies in administration, and so to correlate all the societies as will best secure a maximum of efficiency with a minimum of expense.

The officers of the national council are Rev. Charles Reynolds Brown, D. D., New Haven, Conn., moderator; Rev. Hubert C. Herring, D. D., Boston, Mass., secretary; and the Rev. Joel S. Ives, Hartford, Conn., treasurer. The incorporation for the national council was effected through the legislature of Connecticut in 1911.

Congregationalism is organized in the State under conferences—in localities, under associations. They are representative bodies, as is the national council, having no legislative, but simply advisory, powers. The benevolent and missionary operations of the churches are carried on under the following societies: American Board of Commissioners for Foreign Missions, which received for its work in 1912, \$1,099,447.51; Woman's Boards, \$338,834.62; Church Building, \$304,805.34; Education Society, \$150,000; Home Missionary, \$261,106.07; American Missionary Association, \$432,681.15; Sunday School and Publishing, \$64,713.00; Ministerial Relief, \$108,260.88. The churches contributed to all work \$2,363,584 as reported by 5239 churches. For administration expenses, 4717 churches reported \$9,307,618. Theological seminaries are those of Andover, Atlanta, Bangor, Hartford, Chicago, Oberlin, Talladega, Pacific, and Gale. Forty colleges have a Congregational origin. In addition to local associations of churches, the State conferences, and national councils, we find clubs, so called, and ministerial associations for intellectual culture, fellowship, and the promotion of the spiritual life. The report ending December 31, 1912, indicated 6064 churches, having 743,026 members; 675,677 members enrolled in Sunday schools; 3014 endeavor societies, with a total membership of 124,654 persons; 1477 men's and boys' organizations, membership, 74,085. The number of ministers is 5944, 1932 of whom are without charge, according to the latest figures. There are, approximately, all told, 14,576 churches, 1,402,202 members, and 1,560,983 Sunday school members.

CONGREGATIONAL METHODIST CHURCH. This denomination had in 1913 13,529 communicants, 333 churches, and 337 ministers. The denomination has semi-annual district conferences, annual State conferences, and quadrennial conferences. It admits both white and colored persons, the latter being separately organized. The denomination is strongest in the South. A publishing house is maintained at Ellisville, Miss. The only educational institution under the auspices of the denomination is

the Atlanta Bible School. The official organ is *The Messenger*, published in Ellisville, Miss. See also RELIGIOUS DENOMINATIONS AND MOVEMENTS.

CONGRESS OF THE UNITED STATES. See UNITED STATES.

CONNECTICUT. **POPULATION.** The population of the State in 1910 was 1,114,757. According to the report of the Bureau of the Census, made in 1913, the population in that year was 1,181,793.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture and those of 1913 are estimates only:

		Acreage	Prod. Bu.	Value
Corn	1913	61,000	2,348,000	\$1,996,000
	1912	60,000	3,000,000	2,310,000
Oats	1913	11,000	308,000	169,000
	1912	11,000	338,000	166,000
Rye	1913	7,000	135,000	124,000
	1912	7,000	122,000	112,000
Potatoes	1913	24,000	2,208,000	1,921,000
	1912	23,000	2,461,000	1,920,000
Hay	1913	37½,000	a 432,000	8,683,000
	1912	379,000	436,000	9,810,000
Tobacco	1913	18,400	b28,520,000	5,989,000
	1912	17,500	29,750,000	7,170,000

a Tons. b Pounds.

MINERAL PRODUCTION. The total value of the products is less than \$4,000,000 annually, of which approximately 80 per cent. is derived from quartz and clay pits. An inconsiderable quantity of iron ore is mined and a small quantity of pig iron is made in the State. The products of the quarrying industry in 1912 were valued at \$1,467,458, compared with \$1,215,462 in 1911. The principal stone quarried is granite. Connecticut is the third State in the Union in the production of feldspar. The output in 1912 was 19,075 short tons, valued at \$94,097, compared with 16,497 tons, valued at \$73,557 in 1911. Other products are mineral waters, quartz, sands, and gravels. The total value of the products of the State in 1912 was \$3,715,480.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under the control of the State include the Connecticut State Prison at Wethersfield, the Connecticut State Reformatory at Cheshire, Connecticut School for Boys at Meriden, Industrial School for Girls at Hartford, and the Florence Crittenton Mission at New Haven. There were also hospitals for the insane at Middletown, Norwich, and Hartford, a colony for epileptics at Mansfield, and a school for imbeciles at Lakeville. The total expenditures for these institutions and certain others which received State aid is about \$1,700,000 annually.

EDUCATION. The school population of the State in 1913 was 255,692, the total enrollment in public schools 197,852, and the average daily attendance was 155,235. The male teachers numbered 361, and the female 5130. The average salary of male teachers was \$125 monthly, and of the female teachers, \$57.87. The legislature of 1913 passed several important measures relating to education. Among these were acts providing for the codification of the school laws. An act providing for vocational guidance was also passed. A provision was made for the or-

ganization in each town of a model school for the observation and instruction of a training class for teachers. An act providing schools for instruction in trades, useful occupations, and avocations was also passed.

TRANSPORTATION. The total railway mileage operated in the State on June 30, 1913, was 2046.09.

POLITICS AND GOVERNMENT. The legislature met in 1913, and passed a number of important measures. These are noted in the section *Legislation* below. There was no election for State officers in 1913. The term of the governor expires in January, 1915, and the next election for State officers is on November 3, 1914. On February 8 the legislature passed a resolution for the State control of the New Haven road. The developments in the history of the New York, New Haven and Hartford Railroad formed the chief features of the history of the State in 1913. They will be found fully discussed in the article **RAILROADS.** The legislature ratified the constitutional amendment for the direct election of senators on April 8. A bill providing for woman suffrage amendments to the constitution was defeated on April 2.

LEGISLATION. The legislature met January 8, 1913, the first session under the new constitutional provision compelling a final adjournment early in June. The Senate was Democratic by 21 to 14, and the House, with 258 members, had 132 Republicans. Various appointments, falling to the legislature, failed through disagreement of the two branches. The governor's action in filling these vacancies was unanimously sustained by the Supreme Court of the State. The constitutional amendment for choosing United States senators by the people was ratified and legislation was passed providing for such election. A State constitutional amendment to increase the pay of legislators from \$300 to \$500 for the session passed both branches by the needed two-thirds vote, and went to the people in October, when it was emphatically rejected. A woman suffrage amendment to the State constitution was rejected by the House on its first appearance. Amendments must pass the House at one session by a mere majority and then pass both branches at the next session by a two-thirds vote before submission to the people. The most important act of the legislative session of 1913 was the workingmen's compensation law, which has been construed by the attorney-general to cover all employers, though at its passage it was supposed that employers of less than five persons (chiefly farmers, of whom there were 99 in the legislature) were exempted. A civil service law was passed for employees in State institutions and a commission appointed of which Charles G. Morris of New Haven is clerk. A State park commission was also appointed. The game laws were overhauled and a new fish and game commission was appointed, with a superintendent, who names a deputy in each county. The Sunday law was slightly relaxed so as to permit free concerts and athletic sports in public parks, if the local authorities consent, and if no prizes are at stake. A general banking law passed, doing away with special charters. The legislature adjourned June 4, and the governor, for lack of funds, vetoed many appropriation bills left on his hands. An issue of \$4,000,000 4 per cent. bonds was marketed toward the close of 1913. The State debt is now about \$11,000,000, all con-

tracted within a decade. See also **LIQUOR REGULATION**.

STATE GOVERNMENT. Governor, Simeon E. Baldwin, Democrat; Lieutenant-Governor, Lyman T. Tingier, Democrat; Secretary of State, Albert L. Phillips, Democrat; Treasurer, Edward S. Roberts, Democrat; Attorney-General, John H. Light, Republican; Commissioner of Insurance, Barton Mansfield, Democrat.

JUDICIARY. Supreme Court: Chief Justice, Samuel O. Prentice, Republican; Associate Justices, George W. Wheeler, Democrat; John M. Thayer, Democrat; Alberto T. Roraback, Republican; John K. Beach, Democrat; Clerk, Geo. A. Conant, Republican.

STATE LEGISLATURE, 1913. Democrats: Senate, 21; House, 120; joint ballot, 141. Republicans: Senate, 14, House, 132; joint ballot, 146. Progressives: House, 6; joint ballot, 6. Democratic majority: Senate, 7. Republican majority: House, 6.

The State representatives in Congress will be found in the article **UNITED STATES**, section *Congress*.

CONSERVATION. See **IRRIGATION**, **FORESTRY**, **LANDS**, **PUBLIC DRAINAGE**, **ALASKA**.

CONSERVATION EXPOSITION. See **EXPOSITIONS**.

CONSTANS, JEAN ANTOINE-ERNEST. A French public official, died April 7, 1913. Born at Beziers in 1833, he studied law at Toulouse, graduating there as doctor of law, and was afterwards for several years engaged in commercial enterprises in Spain. Subsequently he took up the study of law again, and was successively attached as professor to the faculties of Douai, Dijon, and Toulouse universities. He was elected to the Chamber of Deputies in 1876. Three years later he became under-secretary of state in the cabinet of de Freycinet, later occupying positions in most of the French ministries until 1886, when he was appointed temporarily as French minister at Peking. Afterwards for a short time governor-general of Indo-China, he returned to office in 1889 as a member of the Tirard cabinet, and at the crisis of the Boulanger agitation he became minister of the interior. General Boulanger had been returned to the Chamber by a large majority in April, 1888, on the programme of a revision of the constitution. The Chamber was against him, and he resigned, only to be simultaneously reflected in three departments. Finally, in January, 1889, he was returned by a vast majority for the Seine. From that date he was declared to be a danger to the republic, and M. Constans caused a warrant to be issued for his arrest. Boulanger fled, and was condemned in *absentia* to imprisonment in a fortress for life. Constans was still in office when Boulanger committed suicide on the grave of Marguerite Crouzet at Brussels, September 30, 1891. In December, 1898, at the age of 65, he was appointed French minister at Constantinople. It was apparent in 1898 that he had not fully appreciated the forces that brought about the revolution of the Young Turks. This consideration, as well as his age, led to his being superseded in May, 1909, by Bompard.

CONSTANTINE I., KING OF GREECE. He succeeded his father, King George, on the assassination of the latter on March 18, 1913 (see **GREECE**). Born at Athens in 1868, his inclinations were for a military career, and his military education was conducted by the best in-

structors in Europe. On October 27, 1889, he married Princess Sophia of Prussia, sister of Emperor William. During the frequent absences of his father he always acted as regent, and his rule was marked by as much firmness as the constitution of the country would permit. He commanded the Greek troops in the ill-fated war against Turkey, and was blamed by his fellow-countrymen for the reverses suffered by the Greek army. That the criticism was unjust has long since been acknowledged, but at this time there were strong demands that he resign his succession to the throne. During recent years, however, when Greece has been reviving her military powers and preparing for a renewal of the contest against Turkey, the important part taken by Constantine has brought him again the good will of the people. In 1909 Constantine came into collision with the Military League, which consisted of officers of the army and navy. This league had become so powerful that it dictated to Parliament and attempted to dictate to the prince. Lieutenant Typaldos and some other officers seized a torpedo-boat destroyer and announced that they would revolt against the king, seize Crete, and place a son of Constantine on the Greek throne. The revolt was quickly put down, and after the execution of several of its members the Military League ceased to exist. These troubles and others of a similar nature were driven out of the public mind when the Balkan allies began to make ready for the war by which they hoped to drive Turkey out of Europe. Constantine, who was commander-in-chief of the Greek forces, announced at once that he would take the field in command of his troops. The first great victory was the capture of Salonica on November 8. Then followed the long movement for the objective point of the campaign, the capture of the great Turkish stronghold of Janina, in Epirus. The conduct of the Greek troops has been described by the military experts who witnessed it, as masterly. The stronghold was bombarded and charged until overtures for surrender came. Capitulation took place on March 6, 1913, when the entire garrison of 32,000 men laid down their arms and gave themselves up as prisoners. King Constantine has five children: Prince George, born in 1890; Prince Alexander, born in 1893; Princess Helene, born in 1896; Prince Paul, born in 1901; and Princess Irene, born in 1904.

COOLEY, ALFORD WARRINER. An American jurist and public official, died July 19, 1913. He was born in Westchester, N. Y., in 1873, and graduated from Harvard University in 1895. He studied at the Columbia Law School from 1895-97, and in 1898 was admitted to the bar. From 1896-98 he was inspector of the common schools of New York City; in 1900-01 a member of the New York Assembly; and in 1903 United States civil service commissioner. He served in this position for three years, when he was appointed assistant attorney-general of the United States. He was appointed associate justice of the Supreme Court of New Mexico in 1909, but resigned in the following year.

COPPER. Both the smelter and refinery

production of copper in 1912 showed a large increase over 1911, and was the largest in the history of the industry. Several companies that made but small output in 1911 were large producers in 1912, and the year witnessed the beginning of an important output from the Yerington district in Nevada. The domestic consumption of copper showed a considerable increase over 1911, while exports showed a slight decrease. The production of copper in 1912 by smelters in the copper-bearing material in the United States was 1,243,268,720 pounds, valued at \$205,139,338, as compared with 1,097,232,749 pounds, valued at \$137,154,092 in 1911. The production for 1912 was the largest in the history of the industry, surpassing that of 1911 by 146,035,971 pounds in quantity, and by \$67,985,246 in value. The mine production in 1912 was 1,249,094,891 pounds of copper, or 5,826,171 pounds more than the smelters. Twenty-one States and Territories contributed to the copper producing of 1912. Three leading States, Arizona, Montana, and Michigan, produced 72 per cent. of the total output in 1912, as in 1911, and the 8 leading States, including Utah, Nevada, Alaska, California, and New Mexico, produced over 97 per cent. of the total output in 1912. Montana ranked first in the production of more than one-third of the entire output of the country. Michigan ranked second, with slightly less than one-third; Arizona ranked third, with one-fifth of the total output. The most notable feature in the copper industry in 1911-12 was the beginning of the production on a large scale in Alaska. In 1912, 31,926,209 pounds of blister copper were produced in the Territory, compared with 22,314,889 pounds in 1911.

The refinery output of the United States in 1912 was made by 13 plants, making copper by the electrolytic and furnace process. In addition to these refineries there are numerous plants in different parts of the country that make a considerable output from old copper, brass, and other alloys of copper. The total production of new refined copper in 1912 was 1,568,104,478 pounds. Of this quantity 914,935,371 pounds were electrolytic, 231,112,228 pounds were lake copper, 24,777,266 pounds were casting copper, and 32,852,030 pounds were pig copper. In addition there were 360,000,000 pounds of foreign ore refined by the electrolytic process. The following table from the United States Geological Survey shows the production of copper in the United States in 1910-12 by pounds:

State	1910	1911	1912
Alaska	4,311,026	22,314,889	31,926,209
Arizona	297,250,538	303,202,532	359,322,096
California	45,760,200	35,835,651	31,516,471
Colorado	9,307,497	7,991,861	7,963,520
Idaho	6,877,516	4,514,116	7,182,185
Michigan	221,462,984	218,185,236	231,112,228
Montana	283,078,473	271,814,491	308,770,826
New Mexico	3,784,609	2,860,400	29,170,400
Nevada	64,494,640	65,561,015	83,413,900
Oregon	22,022	125,943	311,860
South Dakota	43	1,607	23,657
Utah	125,185,455	142,340,215	132,150,052
Washington	65,021	195,503	1,069,938
Wyoming	217,127	130,499	25,080
Eastern States and unapportioned	18,342,359	20,358,791	19,310,298
Total	1,080,159,509	1,097,232,749	1,243,268,720

From this table it will be noted that Arizona ranks first, although in the total production of copper from 1845-1912 it is surpassed by Montana and by Michigan. Arizona took first place in 1910 in the production and outstripped that of Montana.

The imports of copper of all kinds in the United States in 1912 was 410,240,295 pounds. Of this 124,742,193 pounds came from Mexico. Other large exporters to the United States were Peru, Spain, Canada, Australia, Tasmania, and Japan. The exports in 1912 were 775,000,658 pounds. Of this 252,156,012 pounds were sent to Germany, and 152,618,177 pounds to the Netherlands. Large quantities were also sent to the United Kingdom, to France, Austria, and Canada.

The following table shows the world production of copper in 1911-12:

Producing country	1911	1912
United States	1,097,232,749	1,243,268,720
Mexico	121,072,000	158,760,000
Japan	123,200,000	146,853,000
Spain and Portugal	123,200,000	131,175,450
Australia	99,904,000	105,399,000
Chile	66,304,000	83,569,500
Canada	55,648,011	77,775,600
Russia	57,120,000	73,887,500
Germany	68,320,000	53,581,500
Peru	58,240,000	60,858,000
Sweden and Norway	21,280,000	25,578,000
Cape Colony	15,680,000	14,112,000
Servia	16,317,000
German Southwest Africa and other Africa	22,491,000
Austria-Hungary	5,644,800	8,820,000
Italy	6,720,000	5,071,500
Bolivia	5,600,000	8,158,500
Newfoundland	4,704,000	1,102,500
Turkey	1,568,000	1,102,500
Cuba	8,820,000
Miscellaneous	23,520,000	4,630,500
Total	1,954,957,560	2,251,311,770

AMERICAN PRODUCTION IN 1913. The production of copper in the United States; Canada, Mexico, and Cuba in 1913 and previous years, as compiled by the *Engineering and Mining Journal* (New York), is given in the accompanying table. The figures are based upon reports received from the several producers and represent the smelters' output, which is a different thing either from the mine output or the refinery output, and explains the discrepancy with the figures of the United States Geological Survey. In the case of the Michigan production, however, the smelters are also refiners and their figures for smelting and refining productions are consequently the same.

SMELTERS' PRODUCTION OF COPPER IN THE UNITED STATES (In pounds)

State	1911	1912	1913
Alaska	19,412,000	32,602,000	23,360,000
Arizona	300,578,816	367,952,962	401,223,786
California	36,806,762	31,069,029	32,206,435
Colorado	8,474,848	7,502,000	7,320,000
Idaho	3,745,210	5,964,542	8,594,722
Michigan	216,412,867	231,628,486	161,000,000
Montana	271,963,769	309,247,735	284,210,911
Nevada	65,385,728	82,530,608	83,829,329
New Mexico	1,518,288	27,488,912	48,710,000

Totals.....	882,351	886,855	1,020,022	1,000,716

(a) The statistics in this table are the compilations of the *Engineering and Mining Journal*, except where specially noted to the contrary. (b) As reported by Henry R. Merton & Co. (c) As officially reported. (d) Privately communicated from Japan. (e) As communicated by correspondents. (f) Shipments to Europe. (g) Estimated.

The above statistics for 1913 show how the aggregate production of the year was affected by various circumstances. The Michigan strike reduced the American total, the Mexican production was adversely affected by the revolution and unrest in that country, and the Spanish production by the strikes at Rio Tinto. Chile and Peru just about held their own during the year, the Braden and Chuquicamata enterprises not yet having gained headway. The production of Katanga increased. Siberia (Russia) was the only part of the world to show a great rate of increase in 1913.

See also METALLURGY.

COPYRIGHT. The latest copyright legislation (1912-1913) provided that copyright might be had of the works of an author of which copies are not reproduced for sale, by the deposit with claim of copyright of one, or in some cases two, complete copies of such works

—lectures or the like, dramatic or musical productions, motion pictures, or the like; of a title or description under similar conditions; of a work of art or a plastic work or drawing. This privilege of registration did not, however, exempt the copyright proprietor from the deposit of copies according to earlier provisions of the law in case the work is later reproduced in copies for sale. New penalties for infringement were also passed. According to the new law, also, a claimant of copyright is entitled to a certificate of registration under seal of the copyright office. The registration for the fiscal year, 1912-13, numbered 119,495. There were also 1065 registrations of renewal. The fees for these registrations amounted to a total of \$113,323. Of the fiscal-year registrations for 1912-13, 53,122 were of books; 46,070 were of periodicals; 50,415 were of musical compositions; 4616 of dramatic or dramatic-musical compositions; prints and pictorial illustrations, 27,824; photographs, 23,734; motion picture photoplays, 1742.

At the eighth International Publishers' Congress, held June, 1913, at Budapest, Hungary gave her adhesion to the terms of the Berne convention. The congress also recommended that authors and publishers should form an association to protect their copyrights from cinematograph piracy.

CORDIALS. See LIQUORS.

CORN. The world's corn crop of 1913 amounted to approximately 3,540,000,000 bushels, or nearly a billion bushels less than was produced in 1912. This low production was mainly due to a short crop in the United States, where an unusually severe drouth greatly damaged the crop. As the United States produces over 80 per cent. of the world's crop, the low yield was strongly reflected in the world's supply. Reduced yields were also reported from Russia, Argentina, and Japan, while Italy and southeastern Europe generally produced better crops than in the year before. According to statistics published by the International Institute of Agriculture at Rome, Hungary produced about 187,000,000 bushels; Rumania, 120,000,000; Italy, 110,000,000; Russia, 75,000,000; and Egypt, 58,000,000 bushels. Data taken from other sources indicate a yield of 200,000,000 bushels in Argentina and of 128,000,000 bushels in British India.

According to the United States Department of Agriculture the estimated corn production of the country in 1913 was only 2,446,988,000 bushels, or 677,758,000 bushels less than was produced in 1912. This quantity has been exceeded many times and was 11 per cent. under the average of the preceding five years. The average yield declined from 29.2 bushels in 1912 to 23.1 bushels in 1913. The estimated area of the crop was 105,820,000 acres, a decrease of over 1 per cent. below the acreage of 1912. The value of the crop was far above the value of any other crop, being estimated at \$1,692,092,000, a value not equaled by any previous corn crop. The amount was 28 per cent. of the estimated value of all crops and was over 12 per cent. above the average value of the five preceding crops. The farm price per bushel on December 1 was 69.1 cents, a figure not equaled by 5.5 cents since 1866, and this increase in price more than counterbalanced

the loss in production, thus making the crop of 1913 the most valuable ever produced. The prolonged drouth during the summer had far-reaching effects. As reported by the *American Agriculturist* an area of 13,000,000 acres was abandoned as a grain crop. About 5,000,000 acres were abandoned entirely and some of the remaining acreage was used for fodder, as husking was found unprofitable. In Kansas over 2,000,000 acres were abandoned; in Nebraska, 850,000; Oklahoma, over 500,000; Missouri, 450,000; Illinois, 300,000; Texas, 230,000; Iowa, 200,000; and Indiana, 100,000 acres. As is frequently the case in abnormal seasons the quality of the grain was below the average, being only 81.1, as compared with 86.1 in 1912 and about 85 as the ten-year average.

In 1911, when the average yield was only 23.9 bushels per acre, the quality was 80.6. High temperatures in August and September hastened the ripening of the crop and when the drouth broke the rains had no effect and this advanced stage of maturity prevented damage by frost and a possible further deterioration in quality. When the crop shortage became apparent large numbers of livestock were rushed to market and some sections where corn is always the staple crop were forced to buy it to feed their stock. In Kansas the average yield per acre went as low as 3 bushels and Oklahoma produced only 11 bushels. Nebraska had an average acre yield of only 15 bushels, Missouri 18 bushels, and Illinois 27

bushels. These States form a large portion of the corn surplus area of the country when crop production is normal. The largest yield among the States was secured in Iowa, the yield being 338,300,000 bushels, which was followed by Illinois with 282,150,000, Indiana with 176,400,000, Texas with 163,200,000, Ohio with 146,250,000, and Nebraska 114,150,000 bushels. The largest area, 10,450,000 acres, was reported by Illinois, followed by Iowa, with 9,950,000; Nebraska, with 7,610,000; Missouri, with 7,375,000; and Kansas, with 7,320,000 acres. The highest average for any one State was 40 bushels per acre reported by Massachusetts, New Jersey, Wisconsin, and Minnesota.

The work for the improvement in the production, handling, and use of corn was continued in 1913 with unabated vigor by various agencies, such as the agricultural experiment stations, the agricultural colleges, the national Department of Agriculture, commercial bodies, corporations, etc. In the boys' corn club work the prize winner, living in Alabama, produced 232.7 bushels on one acre at a cost of 19.9 cents per bushel. The fifth National Corn Exposition was held at Columbia, S. C., early in the year and was pronounced a marked success. Under congressional authority the Department of Agriculture completed investigations to justify the fixing of definite grades for commercial corn. The following grades were fixed and promulgated to take effect July 1, 1914:

Grade Classification	Moisture	Damaged Corn	Maximum Percentages of		
			Foreign material, including Dirt Cob, Other Grains, Finely Broken Corn, etc.	"Cracked" Corn, not including Finely Broken Corn (see General Rule 9)	
White, Yellow and Mixed Corn					
No. 1	14.0	2	{ Exclusive of heat damaged or mahogany (kernels	1	2
2	15.5	4	{ May include heat damaged or mahogany kernels not to exceed	1	3
3	17.5	6	{ 1/4 %	2	4
4	19.5	8	{ 1 %	3	5
5	21.5	10	{ 3 %	5	7
6	23.0	15			

All grades must be sweet except No. 6, which may be musty and sour and include corn of otherwise inferior quality. White corn must be at least 98 per cent. white, and yellow corn at least 95 per cent. yellow, and all corn not coming within these limits is to be regarded as mixed. Corn not meeting the requirements of the six numerical grades is classed as sample grade.

CORNELL UNIVERSITY. An institution of higher learning, at Ithaca, N. Y., founded in 1865. The enrollment in all departments in the autumn of 1913 was 4771, divided as follows: College of Arts and Sciences, 1120; College of Agriculture, 1354; College of Architecture, 143; College of Civil Engineering, 469; College of Mechanical Engineering, 874; College of Law, 267; College of Veterinary Science, 122; College of Medicine, 107. In addition there were enrolled, in the summer schools of 1913, 1392, and, in the winter course of agriculture, 597. The faculty numbered 750. There were no notable changes in the faculty during the year. Donations received during

1912-13 amount to nearly \$300,000. The largest gift was one of \$25,000, made by Andrew Carnegie, to Andrew D. White, for the benefit of the university in the celebration of the latter's eightieth birthday. The productive funds of the university amount to nearly \$10,000,000, and the income to nearly \$2,500,000. The volumes in the library numbered 427,000. The acting president in 1912-13 was Prof. Thomas Frederick Crane. Jacob S. Schurman, president of the university, was given leave of absence in 1912, on his appointment as United States minister to Greece.

CORPORATIONS. See TRUSTS, and TAXATION.

CORPORATIONS, BUREAU OF. See BUREAU OF CORPORATIONS.

CORPORATION TAX. See TAXATION.

CORRUPT PRACTICES ACT. See ELECTORAL REFORM.

COSTA RICA. A Central American republic between Nicaragua and Panama. The capital is San José.

AREA, POPULATION, ETC. The estimated area

is 48,410 square kilometers (18,691 square miles). The estimated population December 31, 1912, was 399,424, as compared with 388,266 at the end of 1911. For the latter date the population by provinces is stated as follows: San José, 121,162; Alajuela, 91,707; Cartago, 59,968; Heredia, 42,659; Guanacaste, 33,810; Puntarenas, 20,040; Limón, 18,920; total, 388,266. It must be noted that the 1911 enumeration and the 1912 estimate are incomplete, as several districts and towns were omitted. The population of the city of San José in 1912 is reported at 32,449. In 1910 immigration and emigration were 11,233 and 7236 respectively; births and deaths in 1910, 15,847 and 9723, and in 1911, 16,839 and 9483. In the primary and secondary schools, with over 1000 teachers, there are about 32,000 pupils.

PRODUCTION AND COMMERCE. Agriculture, which is the chief occupation of the people, is carried on successfully. The principal crops are bananas and coffee, but of considerable importance also are corn, sugar, beans, rice, and cacao. There is some mining of gold and silver.

Total imports and exports have been as follows: 1910, 16,984,378 and 18,009,385 colones respectively; 1911, 19,079,917 and 19,191,808; 1912, 21,675,928 and 21,427,966. The importation of gold and silver coin (included above) amounted to 20,307 colones in 1911 and 3,117,307 in 1912. The leading imports of merchandise in 1911 and 1912 were: Cotton fabrics, 2,630,653 and 1,972,182 colones; flour, 840,560 and 718,420; structural iron and steel, 549,737 and 625,108; steam railway material, 569,723 and 583,373. Other important articles of import are rice, pharmaceutical products, coal, and tobacco. Bananas and coffee make up the bulk of the exports. Their values have been as follows: In 1909, bananas 9,365,690 and coffee 5,677,146 colones; in 1910, 9,097,285 and 5,916,181; in 1911, 9,309,586 and 6,109,542; in 1912, 10,647,702 and 7,623,561. Other exports in 1911 and 1912: Gold and silver in bars, 2,517,372 and 1,625,117 colones; woods, 193,732 and 265,483; hides and skins, 188,542 and 251,073; rubber, 180,784 and 200,825; cacao, 185,806 and 182,988. At least two-thirds of the trade passes through the port of Limón. Imports and exports by countries, in thousands of colones:

	Imports		Exports	
	1911	1912	1911	1912
United States.....	8,336	12,480	10,582	10,639
Germany	3,627	3,200	647	1,191
United Kingdom....	3,305	2,981	7,632	8,921
Central America....	214	710	78	102
France	945	902	129	280
Spain	414	363
Italy	527	390
Other	1,211	650	124	241
Total	19,079	19,192	21,676	21,428

In 1912 the reported entrances at Limón were 538 vessels, of 1,129,606 tons; at Puntarenas, 87, of 178,904 tons.

COMMUNICATIONS. The length of railway in operation is stated at 694 kilometers (431 miles). The Atlantic port Limón is connected by rail with the Pacific port Puntarenas, by way of San José. In 1912 there were 134 telegraph offices, with 2447 kilometers of wire. A wireless station is in operation at Limón. Post offices in 1912, 204.

FINANCE. The standard of value is gold; the monetary unit is the colon, par value, 46.536 cents. Revenue and expenditure in colones have been as follows:

	1909	1910	1911	1912
Revenue.....	9,280,584	11,471,967	9,707,269	9,950,672
Expend.....	9,280,584	8,858,572	9,801,956	9,319,719

Of the revenue 5,829,653 colones were derived from customs in 1911, and 6,015,524 in 1912. The budget for 1914 placed the revenue at 9,200,000 colones and the expenditures at 9,013,635. Sources of estimated revenue (1914): Customs, 5,500,000 colones; liquors, 2,200,000; stamps, 160,000; posts and telegraphs, 325,000; Pacific Railway, 650,000; banana export duty, 225,000; extraordinary receipts, 140,000; total, 9,200,000. Avenues of expenditure: Legislative, 176,337 colones; government, 1,108,933; justice, 362,636; foreign affairs, 246,929; public instruction and worship, 1,535,309; war, marine, and police, 1,303,030; finance, 3,067,137; public works, 1,213,320; total, 9,013,635. Public debt, as reported for December 31, 1911: Foreign, £1,617,200; internal, 11,879,441 colones. A further foreign loan of 35,000,000 francs was issued about the end of 1911 to pay off the bonds of the Pacific Railway and the internal debt. Money in circulation at the end of 1912 amounted to 4,406,375 colones in paper and 3,659,938 in coin.

GOVERNMENT. The president is elected indirectly for four years and is not eligible for the immediately succeeding term. The Congress consists of a single chamber of 43 deputies, also elected indirectly. The president in 1913 was Ricardo Jiménez, who was inaugurated May 8, 1910, succeeding Cleto González Víquez.

HISTORY. In his message to Congress on May 1, President Jiménez devoted considerable attention to finances. The actual revenues for the past year had amounted, according to his report, to 9,950,671 colones, giving a surplus of 630,952 colones over the expenditures of 9,319,719 colones. The government was especially solicitous for the furtherance of education; 1,291,832 colones had been expended for schools and colleges in the preceding year, and Congress was asked to increase the inheritance tax for the benefit of the School of Arts and Crafts and the hospital fund. The president also recommended to Congress a project for the construction of a railway in the province of Guanacaste. Among the measures passed by Congress was a law restricting the armed force of the president to 1000 in time of peace and 5000 in case of insurrection. Presidential elections were held on December 10. The candidates were Rafael Iglesias, Maximo Fernandez, and Carlos Duran, the latter being supported by President Jimenez. Early returns indicated an indecisive vote, it will therefore be incumbent upon Congress to elect one of the two highest candidates, Carlos Duran or Maximo Fernandez.

COST OF LIVING. See **FOOD AND NUTRITION. PARCEL POST, and PRICES.**

COTTON. The International Institute of Agriculture at Rome on December 20, 1913, estimated the cotton crop of the United States, India, Egypt, and Japan at 18,592,000 bales of 500 pounds each. The United States Depart-

ment of Agriculture on December 12, 1913, estimated the cotton crop of this country at 13,677,000 bales of 500 pounds each, a somewhat smaller crop than that of 1912, but more than a million bales greater than the average of the past five years. The money value of the crop at that date was estimated at \$797,841,000, a decided increase over that of 1912, owing to a higher market price. On December 13, 1913, there had been reported to the U. S. Bureau of the Census as already ginned 12,923,606 running bales. On the same date in 1912, 92.5 per cent. of the crop had been ginned. In the ginning report there are included 91,683 round bales, each counted as half a bale, and 69,312 bales of Sea Island cotton. The Sea Island cotton was produced as follows: Florida, 24,126; Georgia, 38,806; and South Carolina, 6380 bales.

The crop for 1912, estimated crop for 1913, and amount ginned on December 13, 1913, exclusive of linters, by States were as follows:

States	Crop of 1912 500-lb. bales	Estimated crop, 1913 500-lb. bales	Reported ginned Run. bales
United States..	13,703,421	13,677,000	12,923,606
Alabama	1,342,275	1,510,000	1,444,603
Arkansas	792,048	900,000	884,702
Florida	52,760	68,000	63,032
Georgia	1,776,546	2,275,000	2,213,426
Louisian	376,096	400,000	391,266
Mississippi	1,046,418	1,195,000	1,084,584
North Carolina	865,653	765,000	706,252
Oklahoma	1,121,250	820,000	791,623
South Carolina	1,182,128	1,330,000	1,276,402
Tennessee	276,546	375,000	340,546
Texas	4,880,210	3,930,000	3,627,410
All other States.	91,491	109,000	99,760

Of the crop of 1912 among the States listed as "all others," Missouri produced 55,691, and Virginia 24,398 bales. In 1913 Missouri is estimated to have grown 66,000, Virginia 25,000, and California 18,000 bales. Cotton, in commercial amounts, was also produced in Arizona, New Mexico, Kansas, and Kentucky. The estimated crops of Texas and Oklahoma for 1913 were about 1,200,000 bales less than in 1912, due to the excessive drought, but in nearly every other State an increased production was shown.

In addition to the cotton crop of 1912 there were produced 602,324 bales of linters and 6,104,000 tons of seed, of which 4,579,508 tons were crushed for oil. The estimated value of the cotton seed products was \$132,230,000. The cultivation of Sea Island cotton in the United States does not seem to be increasing, and the crop of 1912, which was 73,777 bales, was the smallest, with one exception, since 1899, and it was probable the crop of 1913 would not be much greater than that of 1912. In 1912 the British West Indies exported 7621 bales, most of which was Sea Island cotton produced in Barbados and St. Vincent. The growing of Egyptian cotton in Arizona and California was being extended and preparations were being made to plant 5000 acres in 1914. This amount was thought to be greater than could be harvested owing to a lack of experienced pickers. In California, especially in the Imperial Valley, the growing of a long staple upland cotton had proved very successful. The development of the cotton industry in Hawaii had been greatly impeded by the pink bollworm, a pest that was also becoming quite serious in Egypt.

The world's production of cotton for mill con-

sumption was somewhat less in 1912 than in the previous year, a loss of about 300,000 bales being reported. The contributions of the leading countries to the mill supply of 1911 and 1912, according to the United States Census, were as follows:

Country	1912 500-pound bales	1911 500-pound bales
Total	21,817,000	22,151,000
United States.....	13,696,000	15,546,000
India	3,518,000	2,630,000
Egypt	1,523,000	1,463,000
China	1,074,000	625,000
Russia	960,000	925,000
Brazil	320,000	320,000
Mexico	140,000	100,000
Peru	123,000	123,000
Persia	118,000	80,000
Turkey	115,000	124,000
All other countries.....	235,000	210,000

The world's consumption of cotton for the year ending August 31, 1913, was 20,277,836 running bales, of which the United States supplied 13,760,261, or about 67 per cent. On the same date there were 3,540,771 bales in warehouses, mills, or in transit, 1,622,366 bales of which were American. Of the 143,453,659 spindles reported in the world it was estimated that 129,895,651 were at work during the year. The number of active spindles in the United States on August 31, 1913, was 30,590,553, of which 11,971,002 were in the cotton States and 18,619,461 in all other States. The exports of cotton from the United States for the year ending August 31, 1913, were 8,779,338 bales and the imports were 227,616 bales, about three-fourths of which came from Egypt.

Data regarding the cotton crop for 1913 were rather meagre at the end of the year. The crop in India was believed to be somewhat greater than in the previous year, and in Egypt the government estimate of 1,515,000 bales would indicate about the same outturn as that of 1912. In India the acre yield continued very low, but experiments were in progress in breeding new varieties adapted to the country but of higher yielding quality. Cambodian cotton, a variety resembling the American upland cotton, was proving well adapted to growing under irrigation in the south of India. In Egypt the pink bollworm continued to be considered a serious menace to the crop. English, German, and French organizations continued their activities toward extending the colonial production of cotton. The British Cotton Growing Association was the most active of these agencies. It reported favorably on the crop of Uganda, estimating it at double that of 1912. In Nyasaland there was a decided falling off in cotton production except in the lowlands, where the cultivation is entirely in the hands of the natives. The crop of 1912 was 3474 bales, valued at \$287,207. In Lagos there were produced in 1912 for export 9146 bales, and in northern Nigeria, 2627 bales. The total amount of cotton shipped to England from her colonies, India excepted, in 1912, was 55,662 bales, as follows: West Africa, 10,796; East Africa, 36,667; West Indies, 7337; and miscellaneous, 862. The British Cotton Growing Association began an active campaign in Australia by contributing to experimental investigations and offering a guaranty of 13 cents a pound for cotton produced in 1914.

A British syndicate of cotton spinners was reported to have purchased a tract of 25,000 acres in the Yazoo Delta region of Mississippi on which to grow long staple upland cotton. A large British loan was reported for railroad and irrigation development with a view to increasing the production of cotton in the Sudan. The German colonial committee continued its efforts to develop cotton growing in German East Africa, more than 560,000 pounds of seed having been distributed gratuitously during 1912. Egyptian cotton failed except in a few localities, but certain types of upland cotton gave better results. In Togoland experiments with Sea Island cotton gave satisfactory results, and the area planted to this crop was to be extended. The 1912 production of cotton grown under the auspices of the French Colonial Cotton Association was 2772 bales. A recent writer called attention to the great loss due to insects following the introduction of American cotton into various parts of Africa. In the Sudan the borer, *Sphenoptera gossypii*, caused great injury, other insects destroyed the Egyptian cotton in German East Africa, and the bollworm in Dahomey. In most instances the less valuable native varieties suffered but little loss. The Argentine government sought to encourage the cultivation of cotton by distributing seed, building roads, and providing purchasing facilities. The crop in Turkestan and Transcaucasia for 1913 was the most satisfactory ever produced. Most of it was grown from American seed. Cotton cultivation in Siam was increasing, most of it being ginned and marketed through Bangkok. Algeria established a rigid quarantine on the importation of cotton seed, and all that came into the country had to be fumigated with hydrocyanic acid gas and treated with a corrosive sublimate solution to destroy all insect and fungus pests.

WORK OF THE U. S. DEPARTMENT OF AGRICULTURE. The preparation and distribution of standard cotton grades continued, and they were distributed in 40 States and 10 foreign countries. These standards were adopted by the New York Cotton Exchange in December, 1913, having been previously adopted by a number of the other important exchanges and cotton associations in this country. The third annual opening of a set of cotton samples stored in vacuum tubes showed no deterioration in the samples, indicating the permanency of the official standards. An investigation showed errors in expert grading of cotton of from one to three-sixteenths of an inch in length of fibre, indicating the necessity of standards for length. Experiments conducted by the department showed that the quality of fibre was markedly improved by storing cotton for some time before ginning. A study was begun on cooperative cotton handling and marketing, and the investigation showed that much cotton was undergraded in buying, owing to a lack of fixed standards. The effect of heating cotton seed in storage was investigated, and it was found that when the temperature rose to 110° F. only 5 to 13 per cent. germinated, and if the temperature went to 127° none sprouted when tested. The work of the department in introducing and establishing new varieties of cotton adapted to certain conditions was actively continued. The Durango cotton, recently acclimated from Mex-

ico, seemed better adapted to irrigation farming in the Southwest than any other long staple cotton tested. It was extensively planted in the Imperial Valley in California, about 5500 acres being planted to this variety in 1913, the acreage being limited only by the seed supply. In the Salt River Valley, Arizona, about 4000 acres were planted to Egyptian cotton in 1913, following a very successful demonstration in 1912, when an average of a bale to the acre was obtained. The work in farm demonstration, begun after the advent of the boll weevil in the South, was actively continued, and in 1912 the average yield of seed cotton on the demonstration farms was said to have been 1054.8 pounds per acre, as compared with State averages of 579.6 pounds.

The Bureau of Entomology reported upon the advance of the cotton boll weevil during 1913. The advance was about 50 miles in its northern and eastern distribution. This pest had nearly reached Tennessee on the north, and the extreme southwest of Georgia on the east. About one-half of Alabama was covered by it in 1913, and it was found in ten counties of Florida. In Arizona a boll weevil so greatly resembling the Mexican species as to be called a variety was found feeding upon the so-called wild cotton, *Thurberia thespesioides*. From the feeding habit of the new variety it was quite probable that it would readily transfer its activities to cotton if that plant should be present. The Federal horticultural board recommended a quarantine against seed from Mexico and Hawaii on account of the reported presence of the pink bollworm, and it became effective on July 1, 1913.

CRAIGIE, DAVID JOHNSTON. An American soldier, died December 15, 1913. He was born in Broomieside, Scotland, in 1840, moving with his parents to the United States when a child. In 1861 he enlisted as first lieutenant in the Eighth Iowa Volunteer Infantry, served throughout the Missouri campaign and in the battles in which General Grant started the Mississippi campaign, and at the end of the Civil War enlisted in the regular army. At the outbreak of the Spanish-American War he was captain in the Twelfth Infantry; was promoted to be major in 1898; and lieutenant-colonel in 1901. He served with the army in the Philippines, and in 1903 was appointed a brigadier-general and placed on the retired list at his own request.

CRAMP, CHARLES HENRY. An American shipbuilder, died June 6, 1913. He was born in Philadelphia in 1828, the son of William Cramp, also a shipbuilder. After having served an apprenticeship in shipbuilding, he began work in the yards of his father. At the death of the latter, he became the head of the company, which at that time was small. In 1878 he built his first warship, the *Zambica*, for the Russian government. Following this he designed hundreds of ships and marine engines, and his technical knowledge and practical experience

were often used to advantage by the United States government. In 1903 the Cramp's Industry was incorporated, and Mr. Cramp, on account of his advanced age, retired from the presidency. This company came to be one of the largest shipbuilding establishments in the world. Mr. Cramp took an active interest in civic and municipal affairs, and in 1889 succeeded Dr. William Pepper as president of the board of trustees of the Philadelphia museums.

CRAWFORD, JAMES LUDOVIC LINSAY, 26th Earl of. A Scotch nobleman and astronomer, died January 31, 1913. He was born at St. Germaine-en-Laye, France, in 1847, and was educated at Eton and at Trinity College, Cambridge. He succeeded his father as Earl of Crawford in 1880. From 1874 to 1880 he was member of Parliament from Wigan. He was a student of astronomy, and was former president of the astronomical society. He was one of the trustees of the British Museum.

CRAWFORD, SAMUEL JOHNSON. An American soldier and public official, died October 21, 1913. He was born in Lawrence County, Ind., in 1835, and was educated in the public schools. After studying law, he was admitted to the bar in 1856. Two years later he removed to Garnett, Kan. At the outbreak of the Civil War he was appointed captain of the Second Kansas Cavalry. He served until 1865, rising to the rank of brigadier-general of volunteers. From 1865 to 1869 he was governor of Kansas. He was the author of *Kansas in the Sixties*.

CREDIT BANKS. See **AGRICULTURAL CREDIT**.

CRETE (or CANDIA). A Mediterranean island, formerly under the suzerainty of Turkey and administered under the supervision of France, Great Britain, Italy, and Russia. The king of Greece was invested in August, 1906, with the right of nomination of a high-commissioner. On the eve of the Balkan War, the Greek premier, Venezelos, formally declared (October 14, 1912) the union of the Greek and Cretan legislative bodies, and named St. Dragoumis governor-general of Crete for the king of Greece. In virtue of article 4 of the treaty of London (May 31, 1913), Turkey ceded Crete to the allied Balkan states. The powers had not, up to the end of 1913, formally recognized its union with Greece. The governor-general (1913) was L. Roufos Kanakaris.

The island has an area of 3327 square miles, and a population (1911) of 344,001 (307,812 Christians, 27,852 Mohammedans, 487 Jews, etc.). There is a fine anchorage at Suda Bay. The leading products are wheat, fruit, wool, soap, olive oil, carobs, vallonae, and cheese. The 1910 imports amounted to 19,650,000 drachmas, and the exports to 17,477,000. Tonnage entered, 1,811,865. The revenue for 1909-10 was 6,024,729 drachmas, the expenditure 8,567,251; the debt stood at 5,317,226 drachmas. Canea, the capital, has 24,399 inhabitants; Candia, 25,185; Rethymo, 9086.

HISTORY. The ardent ambition of the Cretans to free their island from the sovereignty of Turkey and from the tutelage of the four protecting powers—Great Britain, France, Russia, and Italy—and to annex it to the Greek kingdom, so long thwarted, was at last realized as a result of the Balkan War of 1912-13 (see **TURKEY AND THE BALKAN PEOPLES**). In fact, the reception of Cretan deputies in the Greek As-

sembly in October, 1912, had been one of the excuses for the outbreak of that war. A few days after the declaration of hostilities the powers, who had already in July, 1909, withdrawn their troops, caused the Turkish flag to be lowered at Canea. The last vestiges of Ottoman suzerainty at once disappeared, and during the next few months the islanders fought shoulder to shoulder with their fellow-Greeks of the Greek kingdom. Greece gradually took over the entire government of the island, and, in May, M. Dragoumis was appointed governor-general. By the Treaty of London (May 30), Turkey renounced all sovereignty over Crete. The union of the island with Greece was formally recognized by the other Balkan states by the Treaty of Bucharest (August 10), and by the great powers subsequently. The capitulations and all other privileges enjoyed by foreigners in the Ottoman Empire were speedily abolished by the Greek government, in so far as they affected Crete. In December King Constantine, accompanied by M. Venezelos, the Greek premier and a Cretan by birth, made a state trip to Crete to take possession of the island, and on the fourteenth hoisted the national flag upon the fortress of Canea. See also **GREECE, History**.

The annexation of Crete brings to Greece an accession of a population intelligent and full of vigor, who will be an important factor not only in her army but also in the civil activities of the country. The Cretan gendarmerie, better trained and disciplined than the Greek police ever was, had already, during the war, rendered splendid service to public security, especially in Salonika.

CRICKET. The visit of the Australian players to the United States, Canada, and Bermuda aroused considerable interest in cricket circles in 1913. The Australians played 52 matches in all, winning 48, drawing 3, and losing 1. C. G. Macartney, a member of the traveling team, scored 2379 runs in one of these contests. A new record was made in the international matches by W. F. O'Neill of the Germantown Club, who caught out 10 Australians. The Montreal A. A. sent a team to the United States in July. The visitors won against the Merion Club, drew with Germantown and Philadelphia, and lost to the New York Veterans and Staten Island. The University of Pennsylvania, winner of the intercollegiate championships, in a trip to Bermuda, won matches against Garrison and Hamilton, and lost one match to Hamilton. The annual international match between the United States and Canada was postponed. The New York Veterans won the championship of the New York and New Jersey Cricket Association. In the Metropolitan District Cricket League, the Brooklyn Club won both the class A and class B championships. Cambridge defeated Oxford in their annual contest at Lords, London, by four wickets.

CROSS, JOSEPH. An American jurist, died

October 29, 1913. He was born at Morristown, N. J., in 1843, and graduated from Princeton University in 1865. He took post-graduate studies at that university, receiving the degree of A.M. in 1868. After studying law at the Columbia Law School he was admitted to the bar in the latter year. He practiced until 1905, when he was appointed United States district judge in New Jersey. In 1894 he was a member of the New Jersey legislature, and its speaker; and a member of the State Senate from 1899-1905.

CROSS-COUNTRY RUNNING AND MARATHONS. The senior metropolitan cross-country championship run was won by Hannes Kolehmainen of the Irish-American A. C., his time being 33 minutes 30¾ seconds. S. L. Leslie of the Long Island A. C., finished second, and R. S. Springsteen of the Yonkers Y. M. C. A., third. The team scores were: Irish-American A. C., 19; New York A. C., 45; Long Island A. C., 70; Bronx Church House, 110; Kolehmainen also won the National A. A. U. ten-mile run, breaking all records from 3¼ miles to the finish. His time was 51 minutes 3¾ seconds.

The English cross-country championships, held at Wolverhampton, England, were captured by E. Glover of the Hallamshire Harriers, in 51 minutes 1¾ seconds. G. C. L. Wallach won the Scottish 10-mile championship at Glasgow, his time being 53 minutes 1 second. English runners were the victors in an international cross-country race at Paris, with a score of 38 points. France was second with 61 points, Scotland third with 96 points, and Wales fourth with 150 points. The individual winner was J. Bouin of France. E. Glover, the English cross-country champion, finished second.

In the American intercollegiate cross-country run, held in New York City, Cornell wrested the championship from Harvard. R. St. Boyd of Harvard was the individual winner in 34 minutes 37 seconds. J. S. Hoffman of Cornell finished second in 34 minutes 55 seconds, and W. B. McCurdy of Pennsylvania, third, in 35 minutes 1 second. The scores and order, at the finish, of the various colleges entered were: Cornell, 68; Harvard, 92; Massachusetts Institute of Technology, 103; Pennsylvania, 107; Princeton, 114; Dartmouth, 125; Brown, 143; Yale, 146; Syracuse, 224; Pennsylvania State, 236; Columbia, 333; Michigan, 335. In dual college cross-country runs, Harvard defeated Cornell; Princeton defeated Yale; Yale defeated Harvard; Pennsylvania defeated Cornell, Columbia, and Carlisle; Lafayette defeated Rutgers and Lehigh; Wisconsin defeated Minnesota. The Western Conference cross-country race, held at Columbus, Ohio, was won by Wisconsin. Illinois was second and Ohio State third.

The results of the principal amateur Marathons in 1913 were: Boston A. A., 25 miles, won by Fritz Carlson of Cookes Gynasium, Minneapolis, in 2 hours 25 minutes 14¾ seconds; Missouri A. C., 25 miles, won by W. J. Kennedy of the Illinois A. C., of Chicago, in 3h. 2m. 11s.; modified Marathon, New York, 12¼ miles, won by Hannes Kolehmainen of the Irish-American A. C., in 1h. 5m. 15¾s.; Yonkers Marathon, 25 miles, won by James Duffy of the Eaton A. C. of Toronto; international Marathon race at Berlin, won by C. Ludette in 2h. 34m. 12s.; Polytechnic Marathon at London,

won by A. Ahigen of Sweden in 2h. 36m. 6¾s.

In professional racing, William Kolehmainen made the best showing of the year. He defeated William Queal in a 15-mile indoor race at Boston—1h. 19m. 17s., and Alfred Raines and George Hooley in a 12-mile race at Brooklyn—55m. 25s.; and won the 10-mile Derby at Toronto—52m. 57¾s. Hans Holmer won the British professional 1-mile championship, in 4m. 25¾s., and defeated George Dunning in a 10-mile race at Carlisle, England, in 52m. 58¾s., and F. Vermeulin in a 10-mile race at Manchester, England, in 54m. 11¾s.

CUBA. A republic of the West Indies. The capital is Havana.

AREA, POPULATION, ETC. Cuba is the largest of the West Indian Islands. Its area, with adjacent islands, is 44,164 square miles, or nearly the area of Pennsylvania. The census of 1907 returned 2,048,980 inhabitants. In 1910 the population was placed at 2,220,278, and in 1912 at 2,473,600. In 1907, 69.75 per cent of the people were white, 16.40 mulatto, 13.28 black, and 0.57 yellow. Population of the larger cities (1907): Havana, 297,159; Santiago de Cuba, 45,470; Matanzas, 36,009; Cienfuegos, 30,100; Camagüey, 26,616; Cárdenas, 24,280. In 1911, marriages 12,864, births 74,286, deaths 33,194, immigrants 38,053; of the immigrants, 32,104 were Spaniards, 1369 North Americans, 932 British, and 128 Germans. The republic is divided into six provinces: Habana (Havana), Pinar del Río, Matanzas, Santa Clara, Camagüey, and Oriente.

Under American rule the primary and secondary school systems were reorganized and educational opportunities extended, but illiteracy is still common. As reported for February 3, 1911, there were 3774 public primary schools, with 3856 teachers, an enrollment of 152,658 pupils, and an average attendance of 105,774; pupils in private schools, 24,434. There are several institutes and colleges, and at Havana a university with about 600 students.

PRODUCTION AND COMMERCE. Cuba and British India are the greatest producers of cane sugar in the world; and in recent years the Cuban crops have increased notably. The economic prosperity of the republic is now dependent on sugar. Next to sugar in commercial importance is the tobacco crop, which is cultivated especially in Pinar del Río, and makes possible a large and valuable manufacture of cigars and cigarettes. Besides sugar and tobacco valuable crops are fruits (especially pineapples, coconuts, and bananas), potatoes and other vegetables, cereals, coffee, and cacao. Cattle-raising is carried on extensively in some parts of the country, especially in Camagüey. Live-stock on farms at the end of 1911 and 1912 respectively: Horses, 457,279 and 560,580; mules, 30,799 and 41,192; asses, 1886 and 2298; cattle, 2,329,423 and 2,829,553. There are large mineral resources, especially in Oriente, including iron, copper, manganese, lead, zinc, gold, and salt.

In the calendar year 1912, imports and exports were valued at \$125,902,241 and \$172,978,328, respectively, as compared with \$113,266,-

997 and \$123,136,376 in 1911. For fiscal years ended June 30, imports and exports have been as follows:

	1909	1910	1911	1912
Imp. \$91,447,581	\$103,676,581	\$108,097,782	\$120,229,317	
Exp. \$124,711,069	\$150,909,020	\$129,178,865	\$146,787,295	

Leading imports in 1911 and 1912, respectively, in thousands of dollars: Breadstuffs, 12,989 and 13,904; cotton and manufactures, 9278 and 11,886; meats, 10,631 and 11,242; machinery, 9137 and 9553; iron and steel and manufactures, 6513 and 7226; vegetables, 4492 and 4905; manufactures of leather, etc., 4756 and 4593; chemical products, 3063 and 3999; beverages and oils, 3224 and 3552.

In the fiscal year 1912 the export of raw sugar was 3,546,603,593 lbs., worth \$101,542,170, of which 3,285,417,936 lbs., worth \$93,772,941 went to the United States; refined sugar, 20,574,573 lbs., \$491,346, practically all to the United States. In the same year the export of leaf tobacco amounted to 23,684,944 lbs., worth \$13,819,823, of which 16,769,318, worth \$11,613,718, to the United States; stems, 5,385,144 lbs., worth \$3,575,702, of which \$3,340,591 to the United States. The export of molasses and sugar syrup in 1912 was valued at \$1,390,275; the molasses amounted to 42,812,173 gallons, valued at \$1,387,893. Other exports in 1912: Coconuts, 4,741,000; oranges, 8,003,748 lbs.; pineapples, 30,381 tons (worth \$1,117,709); bananas, 36,317 tons (\$873,092); iron ore, 1,250,842 tons (\$3,174,618); copper ore, 71,801 (\$576,870); cedar, \$914,420; mahogany, \$802,473. The values in thousands of dollars of leading exports have been as follows, in fiscal years:

	1909	1910	1911	1912
Sugar	79,130	108,763	85,169	102,034
Tobacco, unmd.	19,085	15,461	16,889	17,399

Total	108,098	120,229	129,179	146,787

Entered at the ports in the foreign trade, 1911: 1573 vessels, of which 1448 steam; coastwise, 1623 vessels, 1448 steam.

COMMUNICATIONS. At the beginning of 1911, there were 3433 kilometers (2133 miles) of railway in operation; telegraph, 8151 kilometers of line and 9952 of wire, with 180 offices; wireless telegraph stations, 10; post offices, 496.

The Central Northern Railway had under construction the Dolores-Yaguajay line.

FINANCE. For the fiscal year 1913 the budget showed estimated revenue of \$37,940,000 and estimated expenditure of \$33,947,117. Sources of revenue: Customs, \$26,434,000; consular dues, \$500,000; excise, \$3,900,000; lottery, \$3,700,000; direct taxes, \$1,113,000; posts and telegraphs, \$1,076,000; other, \$1,217,000. The larger estimated disbursements: Administration, \$10,117,394; public instruction, \$4,782,653; sanitary service, \$3,781,987; public debt, \$3,710,500; public works, \$3,704,625; finance, \$3,329,504. Public debt (1910) \$62,083,100.

GOVERNMENT. The Congress consists of the Senate (24 members, elected indirectly for eight years) and the House of Representative (83 members, elected by direct vote for four years). The president and vice-president are elected by indirect vote for four years. The president is assisted by a cabinet of eight members. Gen. José Miguel Gómez served as president for the term January 29, 1909-May 20, 1913.

HISTORY. On May 20 the president-elect, Gen. Mario García Menocal, and the vice-president-elect, Dr. Enrique José Varona, were formally inaugurated. The new president immediately formed a cabinet, in which Col. Coe de la Torriente was secretary of state; Col. Aurelio Hevia, secretary of the interior (*gobierno*); Dr. Leopoldo Cancio, secretary of the treasury; Dr. Enrique Nufiez, secretary of sanitation and charities; Dr. Cristóbal de la Guardia, secretary of justice; Gen. Emilio Nufiez, secretary of agriculture; Sr. José Ramón Vilalón, secretary of public works; and Dr. Ezequiel García, secretary of education.

The presidential message, delivered on May 21, commented on the orderly change of administration, promised wise and prudent conduct in office, and recommended the immediate reform of finances. As an example of economy, President Menocal volunteered to do without the \$25,000 which had been regularly allowed for the president's secret service. Many debts had been bequeathed to Gen. Menocal's government by the Gómez (Liberal) administration, and several concessions granted by Gómez were regarded by the Conservatives as illegal and unfair. The most prominent of these was the concession granted to the Ports Improvement Company of Cuba (owned largely in England and Germany), which was allowed to collect a surtax on the merchandise of incoming vessels in return for dredging harbors and carrying out other improvements. The concession was declared null and void on August 4, the secretary of public works took charge of harbor-improvement, and a commission was appointed to investigate the criminal responsibility of the directors of the company. In the course of the, as yet, unfinished inquisition, facts were revealed which might convict various officials of the Gómez administration of the falsification of a public document and the usurpation of authority. Ex-secretary of public works Carrera and Felipe San Pedro, auditor, were indicted on November 4, for misappropriation of funds.

Considerable excitement was caused by the action against the Ports Company, but even more feeling was aroused over the question of finance. President Menocal proposed to raise a loan of about \$15,000,000 to pay off old debts.

and to pay for paving, road-repairs, and sewer construction in Havana. The Liberals in Congress, however, refused to pass the budget, and made it necessary for the president, by a decree published July 2, to declare the budget of 1912-13 still in force pending the adoption of new financial provisions. A special session was called in July, and again in October, but the Liberals obstinately absenting themselves from Congress, prevented the securing of a quorum. These obstructionist tactics were severely censured by Gen. Menocal in a manifesto of October 21, and rumors were current that he would use force if persuasion failed. The Liberals replied with a counter-manifesto protesting against President Menocal's coercive attitude, opposing the loan project, and claiming that the October special session was illegal, inasmuch as the summer special session had not been adjourned. The opposition weakened soon after the opening of the regular session of Congress, November 3, and the Liberals agreed to attend Congress and discuss the loan. In December the loan was approved and Congress adjourned to January 14.

On March 6 an amnesty bill, which would have set at liberty several hundred political and other criminals, was objected to on the part of the United States by Secretary of State Bryan. The bill was thereupon vetoed by President Gomez; but was again passed on April 25 in modified and inoffensive form. In November a revision of the amnesty law was attempted, and the Senate passed an amendment extending pardon to negro rebels and former office-holders of the Gomez administration. Among those whom the amnesty was calculated to benefit were Governor Asbert of Havana province, Senator Vidal Morales, and Representative Arias, who had been indicted for the murder of Chief of Police Gen. Armandina Riva on July 7.

An anti-clerical bill proposed in the House of Representatives in December would forbid processions and street services by priests in vestments, put a stop to the immigration of monks and nuns, and close the cemeteries of religious houses.—On May 13 new and comprehensive health laws were promulgated.—On June 1 the railway connecting Cabarien with Yaguajal and Mayajagua was opened.—On November 9 a small revolt was started by Crecencio Garcia, a mulatto, in Santa Clara province; the rebels were easily subdued by the rural guards. On November 24 the hotels and cafés of Havana closed at 6 P. M. as a protest against the enforcement of a ten-hour labor law.

It was expected that General Menocal's presidency would improve the relations between Cuba and the United States, inasmuch as he had long been interested in the sugar industry and desired commercial development of Cuba in harmony with the interests of the United States. In reply to President Wilson's message of congratulation in May, General Menocal said, "I shall endeavor to cement the friendly ties which bind our republic to the United States. Cuba will deserve the unqualified confidence and support of the American people and expects to have their aid in firmly establishing its right to national life."

CUBISTS. See PAINTING AND SCULPTURE.

CUMBERLAND PRESBYTERIAN CHURCH. During 1913, as a result of the litigation between this denomination and the Presbyterian Church in the United States of

America which has continued since 1906, the Cumberland Church surrendered its publishing house in Nashville, but saved for itself its books, plates, and periodicals. The total membership of the denomination in 1913 is estimated at 115,000. The difficulties between these two denominations date from the effort made in 1906 to combine the Cumberland Presbyterian Church in the United States of America. The general assemblies of both churches in 1903 appointed committees of fraternity and union. These formulated the basis of union, which was approved by the general assemblies in 1904, and was ratified by the Presbyterian Church body in 1905, when the general assemblies took action for the organic union of the two forces. Opposition to this action arose in the Cumberland Church, and a protest was filed against the constitutionality of the assembly's action. In 1906 the assembly by a vote of 165 to 91, approved the report. The opposition then filed a protest, and determined to "continue and perpetrate the general assembly of the Cumberland Presbyterian Church as the same was constituted and organized May 17, 1906." From that time, efforts were directed by the authorities of the Presbyterian Church of the United States of America to obtain possession of the property of the Cumberland Presbyterian Church, while the former resisted this action. This led to many suits in different States which have continued down to the present time. See also RELIGIOUS DENOMINATIONS AND MOVEMENTS.

CUNIBERTI, MAJOR-GENERAL V. E. Italian naval constructor, died December 20, 1913. He was an early advocate of the one-calibre-all-big-gun ship; and was among the first to advocate liquid fuel for marine boilers. He more recently designed a torpedo battleship, "a monster submarine." As a lieutenant in the Naval Construction Corps, he came under the notice of Benedetto Brin, who quickly recognized his exceptional ability. He was sub-director of the Castellamare Arsenal, director of naval construction in Naples, member and later president of the commission for naval design, and a designer of great originality.

CURACAO. A Dutch colony of the West Indies, having a total population (December 31, 1910) of 54,469. Area of Curacao, 212 sq. miles; total area including other islands which compose the colony, 436 sq. miles. Imports (1910), 3,162,310 guilders; exports, 1,716,886. Revenue (1912 estimate), 690,000 guilders; expenditure, 1,107,000.

CURRENCY REFORM. See BANKS AND BANKING.

CURTIN, ROLAND GIDEON. An American physician and writer, died March 14, 1913. He was born in Bellefonte, Pa., in 1839, and was educated at Williston Seminary. At the University of Pennsylvania he took an M. D. in 1866, and in 1868 he became surgeon of the U. S. Geological Survey. In 1875 he was appointed lecturer on physical diagnosis at the University of Pennsylvania, and this position he held until 1895. He was the author (with Dr. F. W. Watson) of: *Influenza* (1893); *Medical Pilgrimage to Panama* (1905); and of over one hundred articles for medical journals and text books.

CURTISS, G. H. See AERONAUTICS, *passim*.

CURTIS, JOHN GREEN. An American physiologist and educator, died September 20, 1913.

He was born in New York City in 1840, and graduated from Harvard College in 1866. Two years later he received his A. M. from Harvard. From the College of Physicians and Surgeons in New York he took his degree in 1870, and on graduation was appointed assistant and demonstrator of anatomy there. He became adjunct lecturer in 1875, adjunct professor of physiology 1876, professor of physiology 1883, and in 1909 was made emeritus professor of physiology. He wrote *American Text Book of Physiology* (1896), and contributed on medical subjects to medical journals.

CUSTERITE. See **MINEBOLOGY.**

CYCLING. Frank L. Kramer had little difficulty in retaining his title as professional sprint champion of the United States. He scored a total of 49 points made up of 7 firsts, 2 seconds, 3 thirds, and 2 fourths. Alfred Gouillet for the second successive year was ranked second, with 33 points made up of 3 firsts, 4 seconds, 2 thirds, and 2 fourths. A. J. Clarke scored 31 points, winning 4 firsts, 2 seconds, 2 thirds, and 1 fourth. Alfred Grenda's total was 23 points, with 6 seconds, 1 third, and 3 fourths. The N. C. A. professional paced championship was run under new conditions, being decided by a 50-mile race at Revere Beach, Boston. George Wiley of Syracuse won the event for the second year in succession. Worth L. Mitten of Davenport, Iowa, finished second, and James F. Moran of Chelsea, Mass., third. The American amateur championship again went to Donald McDougall of Newark, who took 5 firsts. Aubrey Taylor was second with 1 first and 2 seconds. The world's amateur championships were decided at Berlin, William Bailey of England winning the sprint, while Leon Meredith of the same country was victor in the 100-kilometer paced event. Walter Rutt of Germany won the world's professional sprint championships held at Leipzig, Thorwald Ellegard of Denmark finishing second. Paul Guignard, title holder, won the 100-kilometer paced event.

Donald McDougall established four new records in 1913 in amateur competition, unpaced. They were: $\frac{1}{4}$ -mile, 28 $\frac{1}{2}$ seconds; $\frac{1}{2}$ -mile in handicap, 37 seconds; $\frac{3}{4}$ -mile in handicap, 55 $\frac{1}{2}$ seconds; and $\frac{1}{2}$ -mile in handicap, 1 minute, 14 $\frac{1}{2}$ seconds. S. H. Wilcox made two new professional records against time, motor-paced, by covering the $\frac{1}{4}$ -mile in 18 $\frac{1}{2}$ seconds, and the $\frac{1}{2}$ -mile in 37 $\frac{1}{2}$ seconds.

The annual 6-day race held in Madison Square Garden, New York, December 8-13, was won by the Fogler-Gouillet team, the distance traveled being 275 $\frac{1}{2}$ miles. The Fogler-Lawson team won the Boston 6-day race.

CYRENAICA. See **TRIPOLI.**

CYPRUS. An island in the Mediterranean, occupied and administered, since June 4, 1878, by Great Britain, though nominally a part of the Ottoman Empire. Area, 3584 sq. miles; population (1911), 274,108. About 25.9 per cent. are Mohammedans; the rest, members of the native Cypriote Church, an autocephalous branch of the Orthodox Greek. Capital, Nicosia, with 16,052 inhabitants. Total number of elementary schools, 595 (191 Mohammedan, 404 Christian); with 31,780 scholars (5926 Mohammedan, 25,854 Christian).

The ancient copper mines for which Cyprus was renowned have been long abandoned, and

the cultivation of the soil has come to be the main occupation of the people. The government has introduced modern labor-saving machinery, encouraged the planting of fruit trees, and developed an irrigation system to overcome the deficiency of moisture. A vigorous campaign against the destructive locust has greatly reduced that enemy. Improved methods have been adopted in the manufacture of wine and spirits, which are an important export. Other products are cereals, carobs, cotton, linseed, aniseed, silk, cheese, wool, fruits, and vegetables. Grazing is practiced. The coasts are fished for sponges; other fishing has fallen off. Total imports, exclusive of specie, in 1911, amounted to £547,772; total exports, £626,557 (carobs, £182,883; livestock, £94,932; barley, £56,415; wine, £53,685; raisins, £29,636; silk cocoons, £27,587; raw cotton, £22,503; vegetables, £14,106; citrus fruits, £10,179); in 1910, £493,475 and £511,841. Tonnage entered and cleared, 758,502 (113,873 British). Revenue (1911-12), £319,572 (£286,848 in 1910); expenditure, £235,256 (£251,520); grant-in-aid, £50,000 (£50,000); sum payable to Turkey (applied to interest on loan), £48,122 (£43,518).

There were reported, according to the census of 1911, 101 lepers in the island (65 males, 36 females). On the leper farm, March 31, 1912, 99 patients were reported.

The railway (government) from Famagusta to Nicosia has an extension to Morphou.

A high commissioner (1913, Major Sir H. J. Goold-Adams) administers the island, exercising the powers of a colonial governor.

HISTORY. The success which attended Greek arms during the Balkan War of 1912-13 (see **TURKEY AND THE BALKAN PEOPLES**) naturally aroused keen interest among the Cypriotes and elicited from the Greek inhabitants frequent demands for the annexation of their island to the Hellenic kingdom. At the opening of the Legislative Council on March 18, the high commissioner stated that the total surplus available from the preceding year was £70,000, and urged the vigorous prosecution of needful public improvements. The Greek members of the Council at once entered a protest against the British government and withdrew from taking any part in the consideration of the estimates for the current year. Again on June 20 the Greek members addressed a memorial to the secretary of state praying for the union of Cyprus with Greece. The British government promptly disavowed any intention of alienating the island. The refractory attitude of the Greeks made legislation very difficult, and about the only bill which had passed the Council at the time of its final adjournment in June was one intended to bring about, by means of heavy taxes, the gradual exclusion of goats from the island on account of the predatory habits of those animals in the forests and on farming lands. A large number of Cypriotes enlisted in the Greek army and served in the wars against Turkey and Bulgaria.

DAHOMEY. A colony of French West Africa (q.v. for area, population, etc.). The one-time savage and cruel Djedjis (or Fons) and Baribas have been greatly modified under the French régime; the Nagos remain untouched, an unresponsive and treacherous people. The majority of the population manifest a real aptitude for agricultural pursuits. Plan-

tations of oil and cacao palms have proved profitable; corn, cotton, and cacao are cultivated; and forest products are gathered. The imports for 1911 were valued at 19,673,539 francs and the exports at 21,958,301 (palm kernels 12,577,199 francs, palm oil 8,088,401, dried fish, 441,338, live animals 186,401, cotton 165,430, copra 105,081). A railway (748 kilometers), which will when completed connect Cotonou with the Niger at a point near Karimana, is in operation from Cotonou to Saré (261 kms.). A branch runs from Cotonou to Segboroué (58 kms.). The lieutenant-governor (1913), C. Noufflard) resides at Porto-Novo, a town of 40,000 inhabitants; Abomey has 10,732; Ouidah, 13,000; Cotonou, 1954.

DAIRYING. Several reports of extensive studies in milk production were reported from different localities during the year 1913. The cost price varied generally from three to six cents per quart, according to location. The average price paid farmers for market milk sent to the leading cities ranged from 2.904c., the price paid in St. Paul, Minnesota, to 4.437c. per quart paid at Washington, D. C. These figures were higher than prices paid several years ago, but the cost of production increased faster than prices received for milk. Stringent regulations of public health officials, the increase in the price of feed and the scarcity of farm help added materially to the cost of production each year. The price of milk to the consumer advanced less rapidly in the past twenty years than the price of eggs, steak, and bacon, so that compared with these products milk remained an economical food.

A report of a "cow census," originally begun as a private enterprise by ex-Governor Hoard of Wisconsin and compiled by the dairy division of the U. S. Department of Agriculture, contains data collected from thirteen of the principal dairy States. The record of 2163 herds containing 28,447 cows, showed that cows of a good dairy type returned to their owners an average of \$17.38 per cow above the cost of feed, as compared with \$2.03 returned by the cows of a poor dairy type. Cows kept in comfortable stables, fed silage, and whose owners read good dairy literature were found to be in the most profitable herds. Many dairymen who kept poor cows and were not informed on modern methods actually lost money in the dairy business.

Now that the great value of the cow-testing associations in improving dairy production has been demonstrated, the number in the United States, nearly doubled during the year 1913. Over 2500 herds were tested by this coöperative method, besides many others included in associations organized by the agricultural colleges where testing is done without charge.

Several milk and butter records were made during the year, including those by Eminent's Bess, a Jersey, and K. P. Pontiac Lass, a Holstein cow. The latter made 47.18 pounds of butter in seven days, and the former produced in one year, 18,782 pounds of milk containing 962 pounds of fat, equivalent to 1132 pounds of butter. The food cost for this remarkable yield was \$116.54.

Dr. Carl G. P. DeLaval, the Swedish engineer who invented the continuous centrifugal cream separator, which did so much to revolutionize the dairy industry, died at Stock-

holm in February at the age of sixty-seven years. He has been pronounced by some as the greatest benefactor of dairy husbandry in its history.

CERTIFIED MILK. The demand for certified milk, though increasing, was not as great as might be expected, partly because many consumers were not willing to pay the additional price, which was about 6.4 cents more per quart than for ordinary market milk. After twenty years only about one-half of one per cent. of the total market milk supply of the country was certified. There were about sixty-five medical milk commissions which gave certificates to producers who supplied milk of the required standards of purity. These standards varied with each commission, but steps were taken to have them uniform as far as was compatible with local conditions. In a few cities milk was sold as "certified" by dairymen who had no connection with the medical milk commissions.

BUTTER AND BUTTER SUBSTITUTES. G. K. Holmes of the Bureau of Statistics, Department of Agriculture, reported an extensive statistical study of storage butter in which he found that butter was kept in storage on the average about 4.43 months at a cost of .571 cents per pound per month. The amount stored each year is about 157,000,000 pounds, and the effect of storing is to equalize the price both for the consumer and the producer. In a special report to the mayor of Philadelphia on the cost of marketing butter, it is stated that the price paid the farmer was 18.5 cents for a low grade, and 23 cents for high grade butter. The retailer's price for the same grades ranged from 32-38 cents for the low grades and 40-45 cents for the high grade, so that the cost of marketing was equal to the cost of production.

For the first time in 1913 foreign butter came into competition with the home product. Shipments of butter arrived in the United States from Australia, New Zealand, Argentina, and Siberia, but most of this foreign butter was of a low grade, particularly that from Siberia.

Improvement in methods of manufacture of oleomargarine during the last two years made it a serious competitor of the poorer grades of butter, particularly in Europe, Australia, and the United States. Formerly it was made mainly from animal fats, but by taking advantage of recent discoveries in chemistry, a large number of vegetable fats were used. The flavor was also improved by the use of bacteria starters such as were used in butter-making. The process of hardening oils by means of hydrogen, which had been successful in soap-making, was also adopted for hardening margarine, and at the same time the undesirable odors and colors were removed.

COCOSE is the name applied to a French product resembling butter, consisting largely of copra. It is gaining in popularity among Mohammedans and Hindus, as it contains no hog fat nor beef tallow, and can be eaten without interfering with their religious views.

LEGISLATION. The most important legislation concerning dairy products was the Underwood tariff bill, which placed milk, cream, and preserved or condensed milk on the free list, and reduced the tariff on butter and butter substitutes from 6c. to 3c. per pound, and on

cheese from 32 per cent. to 20 per cent. *ad valorem*.

Minnesota led other States in dairy legislation, passing laws defining the acid limit of cream, prohibiting the operation of creameries that do not adopt clean methods, prohibiting the use of neutralizer or preservative such as viscogen, lime, and borax in milk products, and preventing unjust discrimination in the sale of milk.

DAIRYING IN FOREIGN COUNTRIES. The output of milk, butter, and cheese in Canada was on the increase, but considerable butter was imported from New Zealand in the winter season. In Argentina each year more attention was paid to making butter for export to England, and in 1913 some was sent to the United States. Although not of the highest grade, the quality improved considerably within the past two years. New standards were adopted early in the year for the export of butter and cream from Australia in order to ensure a good quality of product to purchasers in foreign countries. New Zealand and all the Australian States sent less butter to England than in the previous year. There were unfavorable climatic conditions in Australia, and in New Zealand more attention was given to cheese-making. Canada, which sent 15,000 tons of butter to Great Britain in 1906, was sending practically none, as increasing prosperity had led to greater home consumption and more was sent to the United States than hitherto. The deficiency of home production of cheese in Great Britain was supplied by increased imports from New Zealand. Butter-making made rapid strides in South Africa during the past few years; upwards of fifty creameries were in operation, with a total annual output of about 8,000,000 pounds in addition to about three million pounds made on farms.

The campaign for pure milk in Germany was taken up by the milk-dealers' association, which petitioned for a uniform imperial law relative to the sale of milk, and asked that proper methods of handling and caring for milk be taught in the public schools. It also tried to enlist the coöperation of the railroads in bringing about more sanitary conditions in the transportation of milk.

Although there were about 2,600,000 milch cows and buffaloes, and over 3,000,000 ewes in Hungary, milk production was not profitable to the small farmer, but the recent formation of cow-testing associations and coöperation in other ways, gave evidence that the situation would be much improved when the movement had covered a wider territory.

BIBLIOGRAPHY. Among the more important publications which appeared during the year are the following: F. Bordas, and F. Touplain, *Laiterie, Lait, Crème, Fromages* (Paris); C. H. Felkes, and R. H. Shaw, *The Influence of Lactation on the Composition and Properties of Milk*; Bureau of Animal Industry Bulletin 155 (Washington, D. C.); W. Ernst, *Grundriss der Milchhygien für Tierärzte* (Stuttgart); O. F. Hunziker, H. C. Mills, and G. Spitzer, *Moisture Control of Butter* (Indiana Experimental Station, Bulletins 159 and 160, Lafayette, Ind.); O. Jensen, *Die Bakteriologie in der Milchwirtschaft* (Jena); C. Larsen, and W. White, *Dairy Technology* (New York); H. W. Overbosch, *Statistisch Studien über Rinderbeurteilung nach*

den Körpermassen (Gouda, Holland); L. A. Rogers, W. N. Berg, C. R. Pottetiger and B. J. Davis, *Factors Influencing the Change in Flavor in Storage Butter* (Bureau of Animal Industry, Bulletin 162, Washington, D. C.); J. L. Sammis and A. T. Bruhn, *The Manufacture of Cheese of the Cheddar Type from Pasteurized Milk* (Bureau of Animal Industry, Bulletin 165, Washington, D. C.); H. H. Wing, *Milk and Its Products* (new edition, New York).

DAMS. There were under construction during the year 1913 a number of notable dams in connection with various water supply and power projects. Great progress was made on the Kensico dam of the Catskill Aqueduct system, which was probably the most massive construction of the kind ever attempted. It is of Cyclopean masonry and was to rise to a height of 306.8 feet above the bottom of its foundation, the lowest part of which was founded in the excavation of a pre-glacial gorge, in which was involved the removal of disintegrated and unsound rock. The new dam, which involves, in round numbers, one million cubic yards of masonry, was more than one-third completed at the end of the year, as on December 20 more than 316,000 cubic yards of Cyclopean masonry and concrete blocks had been set in place. The construction was unique in that the traveling derricks running on service tracks used for setting the huge blocks of masonry and concrete, were carried on elevated tracks set on concrete piers, which were left embedded in the dam as the masonry grew in height, and new levers, each 20 feet or more in height, were set as the work progressed. The construction of this dam was notable in that between August 25 and September 24, in 25 working days, there were placed 49,850 cubic yards of Cyclopean masonry, 2630 cubic yards of concrete blocks, previously made, and 760 cubic yards of mass concrete, or a total of 53,240 cubic yards, on an average of 2130 cubic yards per day.

SPAULDING DAM. What promised to be eventually the highest dam in the world was being constructed on the South Fork of the Yuba River, one and a half miles from Smart, a station in California, on the Southern Pacific Railroad. This dam impounds a flow from a drainage basin of 120 square miles, with an average annual rainfall of 60 inches and a runoff of 80 per cent. It is a structure of massive Cyclopean masonry and was being constructed across a canyon 2200 feet down stream from an earlier dam which formed a reservoir known as Lake Spaulding. At the site of the new dam the geologic formation was granite and diabase, and the design was in the form of an arch across the canyon. During 1913 it was being constructed to a height of 260 feet above the bed of the river, and it was so designed that later it could be raised to a height of 305 feet, or 325 feet above the lowest part of the foundation. At this height the reservoir would contain 30 billion gallons of water.

HALES BAR DAM ON THE TENNESSEE RIVER. An important project was in course of construction during the year at Hales Bar, Tennessee, a short distance below Chattanooga on the Tennessee River. There was under construction a dam to impound the water so that the mountain section of the river might be improved for navigation and, at the same time, that hydraulic power should be furnished. Several

modifications in the project, including the placing of the dam as well as the dam itself, were required from the time of the first conception of the idea and the necessary authorization from Congress, as the Tennessee River is a navigable stream under Federal control.

The work consisted in the construction of a dam 1200 feet in length and 65 feet in maximum height, with a bottom thickness of 68 feet, and a width on the crest of 11 feet 6 inches. The up-stream face is vertical and the down-stream face is a slope of four on three horizontal. The concrete is carried to an extreme depth of 83 feet below crest level. The lock, which is on the west bank, was excavated in solid rock, and is 60 feet in width by 312 feet in length inside, with a lift of from 20 to 40 feet, depending on the stage of the river. The gates are 30 feet wide, 59 feet high at the lower end, and 37 feet high at the upper end. The river wall of the lock is 630 feet in length and has a height of 60 feet.

On the east side, at the opposite end of the dam, was constructed the power and transformer house, the former being planned for seven bays each to contain two power units of 3400 kilowatts capacity. Each unit consists of three wheels on a vertical shaft 94 feet high, on top of which is the revolving element of an alternating current generator. The dam foundation was completed in August and the last concrete for this part of the work was placed later in the year. Extraordinary difficulties were encountered, and caisson construction was required for the foundation. See TRANSMISSION OF ELECTRIC POWER.

EARTH DAM. During the year a notable earth-fill dam, without masonry core, 2080 feet in length on the crest, and having a maximum height of 106 feet, was built at Peck's mill, in the town of Somerset, Vt., as one of the elements in the power development on the Deerfield River, for the New England Power Company. This dam was constructed largely by depositing material from trestles and a concrete spill-way was built with a spill-way channel through rock on the west side of the dam.

ROLLING DAMS. The rolling dam, which had been extensively used in European engineering practice, was attracting considerable attention in the United States, and the United States Reclamation Service installed one on the Boise (Idaho) project, while during the year it let a contract for the erection of another on the Green Valley project in Colorado. The most important step in this direction, however, was the decision of the Washington Water Power Company to employ rolling dams for the Long Lake development near Spokane. In this case three rollers, 65 feet in length, with a circular section 13 feet in diameter, were designed, and one of these rollers is provided with sheath extensions to raise the water level to a height of 19 feet. A rolling dam is a water-tight steel cylinder rolling on inclined rails supported in recesses in masonry piers or abutments. When it is desired to impound the water the cylinder is lowered and serves as a dam, while it can be raised by means of a chain, or wire rope wound around one end so that it can be suspended out of reach of floating matter. The chief advantages of a rolling dam are the possibility of building discharge openings of large span and depth, and the absence of any obstruction or

ice when the dam is open. They have small leakage, that for the Long Lake development, already referred to, being guaranteed not to exceed two second feet for the three rollers 65 feet long and 19 feet high.

The Boise Rolling Dam, completed in 1913, was constructed to close a logway 30 feet long and situated below the crest of the remainder of the dam. In cross section it was the arc of a circle having a radius of six feet and a chord length of eight feet. A gear wheel at either end works in racks laid at an angle of $21\frac{1}{4}$ degrees with the vertical, and the dam can be controlled either by electric motor, or by gear.

There has been completed in Germany to provide for the Ruhr Valley district at the mouth of the Heve River, a confluent of the Möhne, a large dam to give storage capacity during the extreme low water periods of the Ruhr River. This dam is 131 feet in maximum height, and its cross section is 121 feet wide at the base, with a crest roadway 20 feet in width. It is slightly arched up stream, and has a total length of 2100 feet. It is made of stone laid in cement with a water side faced with two coatings of lime-cement-trass waterproofing mixture with a slight asphalt-emulsion addition, and this, in turn, protected by brick facing. The reservoir thus formed has a capacity of 46,000 million cubic feet, and the total cost of the work was given as about \$5,000,000. The new dam can store about 53 per cent. of the annual run-off from a drainage area of about 160 square miles. There is also a power plant just below the dam containing four turbo-generator units of 1600 horse power each.

DANCES. See TANGO.

DANIELS, JOSEPHUS. An American editor and public official. Secretary of the Navy in the cabinet of President Wilson. He was born in Washington, N. C., in 1862, and received an academic education. At the age of eighteen he became editor of the *Wilson* (N. C.) *Advance*. He was admitted to the bar in 1885, but did not practice. He became editor of the *Raleigh* (N. C.) *State Chronicle* in 1885. From 1887 to 1893 he was State printer, and from 1893 to 1895 he was chief clerk in the Department of the Interior. In 1894 he consolidated the *State Chronicle* and the *North Carolinian* with the *News and Observer* of Raleigh, and became editor of the consolidated paper. He was a member of the Democratic national executive committee from North Carolina for many years, and a member of the Democratic national committee which carried on the campaign for the nomination and election of President Wilson. Mr. Daniels's career as an editor has been marked by vigor, independence, and fearlessness in attacking corruption and fraud.

DANISH WEST INDIES. A Danish colony composed of three West Indian islands: St. Croix, 84 square miles, 15,467 inhabitants; St. Thomas, 33 and 10,678; St. John, 21 and 941. The inhabitants are chiefly negroes and the main industry is the cultivation of sugarcane. Charlotte Amalie (on St. Thomas) is the capital. The governor in 1913 was L. C. Helweg-Larsen.

DARSONVILLE. See CHEMISTRY, INDUSTRIAL, under *Explosives*.

DARTMOUTH COLLEGE. An institution of higher learning, at Hanover, N. H., founded

in 1769. The number of students enrolled in the several departments in 1913-14, was 13,031, while the faculty numbered 116. Among the noteworthy changes in the faculty during the year were the resignation of James Milton O'Neill, assistant professor of oratory, and the retirement of Charles Franklin Emerson, as dean of the academic faculty. R. L. Theller was appointed to succeed Professor O'Neill, and Craven Laycock to succeed Mr. Emerson. Homer Eaton Keyes resigned as professor of fine arts to become business director of the college. George Breed Zug was appointed to succeed him. Henry Wood Shelton was appointed assistant professor of business organization in the Tuck School of Administration and Finance. Noteworthy benefactions during the year included the gift of \$75,000 by David D. Stuart, to found the Levi M. Stuart fund, and \$100,000 by Wallace F. Robinson for Robinson Hall. The productive funds of the college amount to about \$3,750,000, and the total income to about \$375,000. The library contains about 125,000 volumes. The president is Ernest Fox Nicholls, LL. D.

DAVIS, JEFF. United States senator (Democrat) from Arkansas, died January 2, 1913. He was born in Little River County, Ark., in 1862; educated in the public schools; and studied law at Vanderbilt University, taking his degree in 1884. In the same year he was admitted to the bar. He was prosecuting attorney of the 5th judicial district of Arkansas in 1892, and in 1898 was elected attorney-general of the State. He was governor for three terms, from 1900-07, and the only governor elected three times. In the last year of this office he was elected United States senator for the term ending 1913. In the senatorial primaries held in 1912 he was renominated, but died before his election could be ratified by the legislature. (See ARKANSAS.) Senator Davis was one of the most aggressive politicians in public life. During his career in the State politics his campaigns for governor and senator were marked by extreme bitterness. He made himself particularly the champion of the "common people" as against capitalists, and his attacks against the "money power" made him notorious throughout the country. He continued this attitude after his election as senator, and nearly all of his addresses before the Senate were devoted to attacks on financial interests. In spite of his bitter and at times intemperate utterances, his personality is said to have made him one of the most popular members of the Senate.

DEATH RATE. See VITAL STATISTICS.

DE HAVEN, JOHN JEFFERSON. An American jurist, died January 26, 1913. He was born in St. Joseph, Mo., in 1845; four years later removed with his parents to California; and was admitted to the bar in 1866. From 1867-69 he was district attorney at Humboldt County, and in the latter year was elected member of the State House of Representatives. From 1871-74 he was a member of the State Senate; city attorney of Eureka from 1878-80; in 1882 defeated Republican candidate for Congress; judge of the Superior Court of the State from 1884 to 1889. In the latter year he was elected to the Fifty-first Congress, but resigned on October 1, 1890, to be appointed associate justice of the Supreme Court of California in the following year. In 1897 he became United

States district judge for the northern district in California.

DELAWARE. POPULATION. The population of the State in 1910 was 202,322. According to the estimate of the Bureau of the Census, made in 1913, the population in that year was 208,036.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	197,000	6,206,000	\$3,662,000
	1912	195,000	6,630,000	3,381,000
Wheat	1913	113,000	1,638,000	1,441,000
	1912	111,000	1,942,000	1,864,000
Oats	1913	4,000	122,000	62,000
	1912	4,000	122,000	55,000
Rye	1913	1,000	14,000	11,000
	1912	1,000	14,000	11,000
Potatoes	1913	11,000	957,000	718,000
	1912	11,000	1,100,000	770,000
Hay	1913	72,000	94,000	1,476,000
	1912	72,000	96,000	1,440,000

a Tons.

MINERAL PRODUCTION. The mineral production of the State is limited to its quarries, to its clay, sand and gravel pits, and to mineral waters. The total mineral output in 1912 was valued at \$425,360, of which \$193,074 was represented by the output of the stone quartz, and \$162,216 by the coal products. The total mineral production in 1911 was \$491,607.

FINANCE. The total receipts from all sources for the fiscal year 1913 amounted to \$676,953. The disbursements for the same period were \$707,158. There was a balance at the beginning of the fiscal year of \$92,347, and at the end of the fiscal year of \$61,749. The chief sources of revenue are licenses and fees from clerks of the peace, insurance and banking departments, railroads, State tax corporations, franchise taxes from corporations, and collateral inheritance tax. The chief expenditures are for education, charitable and correctional institutions, public highways, executive and judicial departments, public health, agriculture, legislature, and public defense. The bonded debt of the State at the end of the fiscal year was \$826,785.

POLITICS AND GOVERNMENT. The legislature met in 1913 and passed a number of measures which are noted in the paragraph *Legislation* below. There was no election for State officers. The term of governor expires in January, 1917. The next State election will be held on November 3, 1914. The attempt to elect a United States senator to succeed Harry A. Richardson, whose term expired March 4, 1913, resulted in a dead-lock in the legislature. The House of Representatives on March 19 refused to ratify a resolution favoring the direct election of senators. A woman suffrage bill was adopted in the Senate on March 14. The whipping of six prisoners at the whipping-post in the New Castle County Work House on November 8, resulted in the introduction of a resolution in the national House of Representatives, to prevent whipping in prisons. Delaware is the only State in which the whipping of convicts is permitted. No action was taken on this resolution.

CHARITIES AND CORRECTIONS. The institutions wholly or partly supported by State appropriations are as follows: A State hospital for the insane at Farnhurst; a new Castle County

hospital at Farnhurst; a county work-house at Greenbank; the Ferris Industrial School at Marshallton; the Delaware Industrial School for Girls at Wilmington; the Delaware Orphans' Home for Colored Children, State Road; private institutions and a home for aged women at Wilmington; and a home for friendless children, Wilmington. In addition to this there are hospitals and other private institutions which do not receive State support.

EDUCATION. The total school population of the State between the ages of five and seventeen is about 50,000. In 1911 there were enrolled in the public schools 35,950. The average daily attendance is about 22,559. The teachers employed numbered 993, of whom 857 were women, and 136 were men. Expenditures for schools are approximately \$600,000 a year.

COMMUNICATIONS. The railroad mileage of the State in 1913 was about 335.97. There was practically no new construction during the year.

LEGISLATION. The legislature met in 1913 and enacted several important measures. These include an act to regulate the employment of child labor and creating a child labor commission, an act regulating the hours of labor for females, making ten hours per day or fifty-five hours per week the maximum in certain employments, and an act providing for the secrecy and purity of the ballot. This measure prescribes elaborate rules for the conduct of polling places, the form of ballot to be used, etc.

STATE GOVERNMENT. Governor, Charles R. Miller; Secretary of State, Thomas W. Miller; Lieutenant-Governor, Colen Fegruson; Attorney-General, Josiah O. Wolcott; Insurance Commissioner, William R. McCabe; State Treasurer, Charles A. Hastings; State Auditor of Accounts, William P. Prettyman.

JUDICIARY. Supreme Court: Chancellor, Charles M. Curtis, Rep.; Chief Justice, James Pennewill, Rep.; Associate Justices, Victor B. Woolley, Dem.; Herbert L. Rice, Rep.; William H. Boyce, Dem.; Clerk, Wilbur D. Wilds, Dem.

STATE LEGISLATURE, 1913. Republicans: Senate, 9; House, 14; joint ballot, 23. Democrats: Senate, 8; House 21; joint ballot, 29.

The State representatives in Congress will be found in the section *Congress*, article UNITED STATES.

DEMING, CLARENCE. An American editor and writer, died May 8, 1913. He was born in Litchfield, Conn., in 1848, and graduated from Yale College in 1872. In the same year he became associate editor of the *Troy Whig*, in the year following taking up post-graduate studies at Yale. In 1874-75 he was the editor of the *New Haven Palladium*, afterwards serving as editor and editorial writer for the *New York Evening Post*. He remained with this paper until 1884, when he became editor of the *New Haven News*. After several years with this journal he became associate editor of the *Railway Age Gazette*, and also did general writing for newspapers and magazines. He was the author of *By-ways in Nature and Life*.

DENMARK. A constitutional European monarchy, situated north of the German Empire, between the North and the Baltic Seas. Capital, Copenhagen.

AREA AND POPULATION. The table below gives the insular and mainland divisions, with area

in square kilometers, and population for comparative census years:

	Sq. km.	Pop. 1911	Pop. 1901
Islands:			
Seeland	7,498.34	1,096,897	960,053
Bornholm	587.53	42,885	40,889
Lolland-Falster ...	1,791.23	115,658	105,021
Fyn	3,474.16	303,179	279,785
Jutland:			
Southeast J.....	7,320.70	482,264	430,549
Southwest J.....	10,733.20	364,620	313,764
North J.....	7,563.64	351,573	319,479
Total Denm'k proper..	38,968.70*	2,757,076	2,449,540
Faroë Islands.....	1,398.90	18,000	15,230
Total	40,367.60†	2,775,076	2,464,770

* 15,046 sq. miles. † 15,586 sq. miles.

The average density per 100 square kilometers was, for Denmark proper, 7075; for the Faroës, 1287. The greatest density was in Seeland—14,629; the least, outside of the Faroës, in southwest Jutland—3397. The population of Denmark proper in 1801 was 929,001 (of the Faroës, 5265); as estimated July 1, 1912, 2,800,000. Number of marriages in 1911, 19,879; living births, 73,938; still-births, 1751; deaths, 37,232; foreign immigration, 8303—6809 to the United States, 744 to Canada. Of the total population in 1911, there were engaged in agricultural pursuits 1,003,803 persons; of whom 402,811 men and 110,577 women were active, 145,888 and 344,527 dependent (including 1033 men and 47,110 women in household service); of the 1,003,803 persons, 575,891 were owners or managers, 19,179 overseers, etc., 408,733 laborers. Industrial pursuits occupied 752,203 (276,259 owners or managers, 32,368 salaried employes, 443,576 laborers; professions, 141,909; commerce and transportation, 458,030. The population of some of the principal cities follows: Copenhagen, 462,161 (with suburbs, 559,398); Frederiksberg, 97,237; Aarhus, 61,755; Odense, 42,137; Aalborg, 33,449.

AGRICULTURE. The total cropped area in 1907 was 3,896,870 hectares, divided as follows: 1,122,761 hectares under cereals, 308,362 under roots, 27,247 under industrial plants, 1,229,585 under grasses (including meadows, pastures, and forage plants), 230,413 fallow, 978,502 other (including gardens, parks, etc.). The area under important cereals and the yield is given for two years in the table below, with the yield per hectare in 1912:

	Hectares		Quintals		Qs. ha.
	1911	1912	1911	1912	
Wheat....	40,512	40,512	1,216,157	983,875	24.3
Rye.....	276,009	276,009	5,007,279	4,799,236	17.4
Barley....	233,714	233,714	5,013,129	5,439,031	23.3
Oats.....	402,939	402,939	7,302,941	7,620,647	18.7

The livestock estimate of July, 1910, returns 535,018 horses, 2,253,982 cattle, 726,829 sheep, 40,257 goats, 1,467,822 swine.

Dairying is an important industry. The average annual production of milk per cow is an indication of scientific development—2570 kilos in 1911, compared with 2161 in 1899. The average amount of milk required to make a kilo of butter is 25.4 kilos.

The fisheries products were valued for the year 1911 at 15,230,200 kroner, of which 4,661,700 kr. were for plaice, 4,165,800 for eels, 2,581,800 for herrings, 1,913,400 for cod.

COMMERCE. General and special trade is shown in the following table, values in kroner:

	Imports		Exports	
	Gen.	Spec.	Gen.	Spec.
1909..	725,037,000	566,782,000	608,081,000	443,822,000
1910..	634,407,000	577,166,000	548,074,000	485,374,000
1911..	706,500,000	623,814,000	626,761,000	536,647,000

The following table gives the principal articles of special trade in 1911:

	Imps.	1000 kr.	Exps.	1000 kr.
Cereals	92,692	Butter	192,783	
Oilcake	56,282	Meats	137,222	
Coal	45,276	Animals	61,919	
Iron mfrs.	35,419	Eggs	29,866	
Wood	28,869	Skins	12,709	
Fibre mfrs.	20,806	Barley	10,276	
Woolen mfrs. ...	19,237	Fish	7,831	
Coffee	17,830	Ships	5,872	
Skins	11,981	Iron mfrs.	8,647	

The quantity of butter exported in 1911 was 89,577,100 kilos (88,475,200 in 1910); the number of cattle 153,512 (140,825), and of horses 28,494 (26,106); quantity of dressed pork 114,396,800 kilos (96,778,200), beef and veal 12,558,300 (16,501,600), mutton and lamb 157,700 (215,300), other slaughter-house products, 19,681,000 (17,757,400); of eggs, 21,513,200 score (20,367,300); of milk and cream, 30,453,500 kilos (23,731,100); of fresh fish, 20,579,100 (16,812,400); of barley, 71,861,600 (50,981,100). The principal countries of origin and destination follow (1911 general trade), values in thousands of kroner:

	Imps.	Exps.		Imps.	Exps.
Germany	265,842	160,008	France	17,242	2,873
U. K.	115,375	353,470	Netherl'ds	17,189	3,622
Sweden	67,254	30,878	Belgium	9,992	2,826
U. S.	65,525	9,032	Norway	7,820	16,453
Russia	52,463	15,557	Iceland	5,693	4,901

In the 1911 trade 13,382 sailing vessels, of 587,289 tons, and 22,491 steamers, of 3,428,515 tons, entered (coasting, 20,289, of 277,320 tons, and 77,823, of 1,599,589); cleared, 13,444 sailing, of 230,698 tons, and 22,794 steamers, of 1,282,934 (coasting, 20,284, of 267,785 tons, and 77,717, of 1,563,436). Merchant marine, exclusive of vessels of four tons and under, January 1, 1912: 2147 sailing, of 94,166 tons; 640 steamers, of 411,595; 775 motor boats, of 8220.

COMMUNICATIONS. Of the 3691.3 kilometers of railway line December 31, 1911, 1922.8 km. were state-owned and 1768.5 were owned by private companies. From April 1, 1911, to March 31, 1912, receipts on state lines were 49,106,740 kroner, on private lines 10,193,601; the expenditure, 42,589,727 and 7,060,844. Accidents on state lines during the year, 2 killed and one injured out of 23,211,788 passengers carried over 813,877,960 kilometers; 11 employes killed and 24 injured; 18 others killed and 6 injured. Late in the year there was discussion both in Denmark and Germany as regards a proposed connection between the cities of Hamburg and Copenhagen *via* the island of Fehmarn. Such a proposed line would supplant the three main routes in use, namely (1), *via* Warnemunde and Gildeser, (2) *via* Kiel and Korsör, and (3) *via* Frederica. The new route *via* Lübeck was to form almost a straight line and reduce the time of the journey a little over five hours, but it would not eliminate the train ferries required on the other lines. It was not decided whether the project would be adopted or not, and there was great opposition on the part of the terri-

tories affected through which the older routes passed, but it was evident that the result would be a decrease in the time of travel between Germany and Denmark. In 1913 the rolling stock of the various railway lines in Denmark was estimated as follows: 681 locomotives, 470 locomotive tenders, 1628 passenger cars, 465 mail and baggage cars, 9670 freight and livestock cars, 47 wrecking cars, etc. The railway lines owned 70 snow plows and 8 steamships and 23 ferry steamers. State telegraph lines (March 31, 1912), 3646 km.; wires, 12,959; stations, 172 state, 392 railway; 3,526,527 telegrams were dispatched in the year ended March 31, 1912; the receipts amounted to 2,936,557 kroner and the expenses to 2,419,551. The net gain was 517,006 kr., compared with 288,904 kr. in 1910-11, and 37,437 in 1909-10. Telephone wires: 26,161 km. State, 418,477 private. Post offices (1912), 1125; receipts for the year ended March 31, 17,055,817; expenses, 15,661,224. Number of automobiles registered Sept. 1, 1912, 1587 (682 in 1909). Highways (1911), 6781 km.; by-ways (1908), 36,218.

ARMY. The effective strength of the Danish army consists on a peace basis of 975 officers, 2398 under officers, and 10,720 men which, on a war footing, might be raised to about 90,000 men. Service is compulsory and lasts for 16 years, half of which must be spent in the line and half in reserve. The recruits spend 165 days in the infantry, 200 days in the cavalry, and various terms in the other branches, and technical troops. Only a portion of the annual contingent is taken for such training.

The troops are organized as follows: One regiment of guards, 10 regiments of line troops, 15 regiments of reserve; cavalry, two regiments of the line, two mixed regiments, formed of line and reserve squadrons; field artillery, two regiments of two divisions of four batteries each and two independent divisions. Coast artillery, 12 batteries of the line and six batteries of the reserve; engineers, one regiment with ten companies of the line and two in reserve. There are two main groups of commands, east and west of the great belt respectively. A substantial beginning was made during 1913 with the strengthening of the sea defense at Copenhagen and the construction of new fortresses, the problems of military defense being one that figured in the political discussions of the country for several years previously.

NAVY. Besides an old battleship, a cruiser, and some small craft, the fleet, which is maintained for coast defense alone, includes 4 monitors, 3 torpedo gunboats, 14 first-class torpedo boats, 3 submarines. Building, 5 torpedo boats, 2 submarines.

FINANCE. The unit of value is the krone, par value \$0.26799. A comparative financial table follows, amounts in kroner:

	1908-9	1909-10	1910-11	1911-12
Rev..	98,859,181	135,248,843	142,102,605	96,491,250
Exp..	107,996,039	133,179,461	139,161,744	116,894,771

The 1912-13 budget estimated the revenue at 97,838,034 kr. and the expenditure at 101,745,054. The public debt stood, March 31, 1912, at 351,978,008 kr.

GOVERNMENT. The reigning king, Christian X., was born September 26, 1870, succeeded his father May 14, 1912. In 1898 he was married

to Alexandrine, duchess of Mecklenburg; and has children: Christian Frederic Michael (March 11, 1899), prince royal; and Knud Christian (July 27, 1900). The legislative body (Rigsdag) consists of an upper (54 members) and a lower (114) house. The king appoints a ministry of eight members responsible to the legislature. The ministry (constituted July 5, 1910) was in the beginning of 1913 composed thus: K. Berntsen, premier and minister for defense; C. W. (Count) von Ahlefeldt-Laurvig, foreign affairs; A. Nielsen, agriculture; J. Appel, worship and instruction; T. Larsen, public works; J. Jensen-Sønderup, interior; N. T. Neergaard, finance; O. H. V. B. Muns, commerce; F. T. von Bülow, justice. As constituted June 21, 1913, the ministry was as follows: C. Zahle, premier and minister of justice; Dr. P. R. Munch, defense; E. J. C. von Scavenius, foreign affairs; Kr. Pedersen, agriculture; S. Keiser-Nielsen, worship and instruction; J. Hassing-Jørgensen, public works, commerce, etc.; Ove Rode, interior; Dr. E. Brandes, finance.

HISTORY. Failing to present a united front on the question of constitutional reform, the government was defeated in the elections to the Folkething on May 20. In the new Folkething the Radicals with 31 members and the Social Democrats with 32 had a majority opposed by 43 of the Left and 7 of the Right; whereas, in the last elections (1910) the Left or government party possessed 57, the Right 13, the Radicals 20, and the Socialists 24. The Berntsen ministry could no longer command a majority and on June 12 the president of the council tendered his resignation. Nine days later, on June 21, a Radical cabinet, drawn chiefly from the staff of the Radical journal, *Politiken*, was formed under the leadership of M. Zahle. In announcing the budget for 1914-15, M. Brandes, the new minister of finance, estimated that there would be a surplus of \$1,000,000, notwithstanding the additional expense incurred in the establishment of free employment bureaus. On September 17 a constitutional reform bill similar to the one rejected by the Landsting in 1912 was introduced in the Folkething and subsequently passed by the overwhelming majority of 101 to 6. The bill, which provided for universal adult suffrage in elections to the Folkething and modified the manner of choosing the Landsting, was effectually opposed by the members of the upper house, because, if it passed, it would have required them to seek election not from a wealthy minority but at the hands of popular communal and municipal councils. Late in October it was reported that subject to the verdict of the next elections it had been determined to extend to Iceland a greater measure of home rule than was granted by the laws of October 3, 1903.

DENTAL SCHOOLS. See **UNIVERSITIES AND COLLEGES.**

DE PAUW UNIVERSITY. An institution of higher learning at Greencastle, Ind., founded in 1837. The total enrollment in the College of Liberal Arts in 1913-14 was 665. In the music department there were 198, and in the academic 65. The faculty numbered 55. There was received during the year for gifts and endowment about \$175,000. The productive funds amount to \$866,534 and the income, including the students' fees, to \$41,547. The library contained 41,537 volumes. The president is George

Richmond Grose, D. D., who succeeded Frances J. McConnell, LL. D., in 1912.

DERBICK, WILLIAM BENJAMIN. Bishop of the African Methodist Episcopal Church, died April 15, 1913. He was born in Antigua, West Indies, in 1843, removed to the United States when a youth, and enlisted in the Civil War, taking part in the battle between the *Monitor* and the *Merrimac*. He was bishop of the West Indies, South America, and the Islands of the Sea.

DETROIT. See **MICHIGAN.**

DE WOLF, JOHN. An American landscape architect, died November 23, 1913. Born in Bristol, R. I., in 1850, he studied landscape architecture in Rhode Island, Boston, and New York, and in Europe, and in 1897 was appointed landscape architect of Greater New York. He had previously been general superintendent of parks in Brooklyn. He resigned his position in New York City in 1902, and thereafter practiced as engineer and landscape architect up to 1906. He designed the Villa Maria of Lake Como. For over twenty-five years he contributed articles to leading publications on landscape architecture and kindred arts.

DIABETES. See **HEDIOSIT.**

DIAMONDS. The first production of diamonds as a result of regular mining operations within the United States was made last year by two companies who have been engaged in the development of diamondiferous pipes near Little Rock, Ark. About 5000 loads of the disintegrated rock were washed by one of the companies, resulting in the extraction of between 700 and 800 stones, the quality and size of which were not reported. The occurrences, as described in an earlier volume of the **YEAR BOOK**, are quite similar to the South African deposits from which most of the present supply of diamonds is obtained.

DIAZ, FELIX. A Mexican soldier, son of General Felix Diaz, a brother of Porfirio Diaz, former president of Mexico, and the leader of the revolution against President Madero. Diaz's father was killed in 1871, during the revolution which the Diaz faction led against President Juarez. Felix Diaz was educated at the military academy in Mexico City, and held many positions of trust and responsibility under his uncle. For six years he was chief of police of Mexico. He supported his uncle throughout the revolution headed by Diaz, which resulted in the exile of the former. But on the triumph of Madero he accepted the situation with apparent grace, and remained a commissioned officer in the federal army. In August, 1912, he resigned from the army. He had previously been approached by influential persons who were dissatisfied with the rule of Madero, and these persons are said to have told him that Madero had become a greater tyrant than the old dictator; that he had broken his promises; and that the great land barons remained as powerful as before. He was assured also of the support of most of the army, if he would lead in the attempt to overthrow him. Felix Diaz soon decided in favor of such a proposal. In October he proclaimed himself commander-in-chief of the rebel forces in Mexico and took possession of Santa Cruz,

the most important port of the country. Every federal soldier in the garrison, and in the police and the fire departments, and many citizens flocked to his banner. He began the uprising with 2000 men under his own command. Gaining control of the arsenal he had an abundant supply of arms and ammunition, and his success seemed certain. The Madero government, however, had laid a trap for his undoing. Madero's spies knew of the plans of Colonel Diaz and on the morning of October 24, 1912, the federal troops attacked Vera Cruz and captured it. Colonel Diaz was taken and tried by a court-martial for treason. He was found guilty and was sentenced to death, but when the news reached the City of Mexico there was dissension in the cabinet as to what course the president should take. The majority of the members favored the death sentence. President Madero's uncle, Ernesto Madero, the finance minister, and his brother, Gustavo Madero, insisted that Diaz should be shot. The president, however, without deciding whether or not to spare Colonel Diaz's life, sent him to prison. He was placed in the military prison at Vera Cruz, but was later taken to the Santiago penitentiary at Mexico City, from which he was released at the outbreak of the revolution. (See MEXICO, *History*.)

DIETETICS. See FOOD AND NUTRITION.

DIKE, SAMUEL WARREN. An American clergyman and publicist, died December 3, 1913. He was born at Thompson, Conn., in 1839; graduated from Williams College in 1863; and studied theology at the Hartford Theological Seminary and at Andover Theological Seminary. In 1869 he was ordained to the Congregational ministry, and held several pastorates in Vermont until 1882. He wrote for many periodicals on marriage, divorce, the family, and other sociological and economic subjects. His writing led to the organization of the Divorce Reform League in 1881. This later became the National League for the Protection of the Family, for which he was corresponding secretary until the time of his death.

DIPHTHERIA. The method of vaccination proposed by von Behring at the International Medical Congress held at Wiesbaden in April, 1913, was looked upon as the most important contribution of the year. The new remedy was stated to be a mixture of a powerful diphtheria toxin with antitoxin, combined in such proportions that the resultant serum shows only a slight, if any, surplus of the toxin. Von Behring presented evidence to show the necessity of a more efficient method of prophylaxis than diphtheria antitoxin, the latter being so quickly eliminated, the immunity conferred by it being of such short duration, and repeated injections occasionally proving dangerous on account of the liability to produce a series of unpleasant symptoms, included under the general term anaphylaxis. Antitoxin, moreover, confers only what is called passive immunity, whereas that conferred by a vaccine is an active immunity and lasts for several weeks.

Various methods of ridding chronic diphtheria-carriers of their germs (the Klebs-Loeffler bacilli) were tried during 1913, and the interesting observation was made by Beyer, that diphtheria bacilli occurred in the urine of every one of nineteen cases in children, at periods

from four to fourteen weeks after their apparent recovery. In carriers the most usual sites are the tonsillar crypts and the small recesses of the nostrils, in addition to the fissures in adenoid vegetations, when these exist. The most promising method, as reported by several investigators, was spraying the throat and nose with a suspension of *staphylococcus pyogenes*. Living germs are used, and while no serious unfavorable results have been reported, in case of a mistaken diagnosis a staphylococcus sore throat may be set up. Alden, of the Iowa State board of health, reported sixteen cases in which a staphylococcus spray was used, with by-effects ranging from a slight edema of the face to sore throat and fever, increased nasal discharge, and headache. Testimony as to the actual danger of the diphtheria-carrier was somewhat conflicting; laboratory cultures showed many strains of diphtheria bacilli found in the throats of carriers to be quite as virulent as those occurring in the height of disease. Various estimates have been made as to the rôle of carriers in the dissemination and propagation of diphtheria. Moss and Guthrie of the Johns Hopkins Hospital followed fifty patients recovered from diphtheria for a period of many weeks, and were absolutely sure that no other persons were infected, although all of these patients harbored diphtheria bacilli in their throats.

DISASTERS AT SEA. See SAFETY AT SEA.

DISCIPLES OF CHRIST. A religious denomination called also CAMPBELLITES after Alexander Campbell of Bethany, W. Va. The denomination has had a rapid growth in recent years. There are two branches—the Disciples of Christ proper, and the Churches of Christ. The first is by far the more important. There were in 1913 1,362,711 communicants, 9076 churches, and 5592 ministers in this branch. The churches of the denomination lie chiefly in the Middle West and the South, though it is represented in nearly every State of the Union. There are also many churches in Australia and other parts of Great Britain, in Cuba, Philippines, Canada, and Scandinavia. Missionary work is carried on in Japan, China, India, Philippines, Hawaii, Cuba, and other countries. The Foreign Missionary Society has general charge of foreign missions, and the American Christian Missionary Society conducts the domestic missions of the denomination. The disciples rank third in the number of churches among the Christian Endeavor Society. It has also many strong educational institutions, including Bethany College, W. Va.; Hiram College, Ohio; Drake University, Des Moines, Ia.; Butler University at Indianapolis, Ind.; and Christian University, Canton, Mo. See also RELIGIOUS DENOMINATIONS AND MOVEMENTS.

DISEASES, OCCUPATIONAL. See LABOR LEGISLATION AND OCCUPATIONAL DISEASES.

DISTRIBUTION OF FARM PRODUCTS. See AGRICULTURE.

DISTRICT OF COLUMBIA. LEGISLATION. Congress in 1913 passed two important measures relating to the government of the District. The first of these was a public utilities commission act. This is very comprehensive and gives the commission power to fix rates and generally supervise all public utilities. The second was a loan shark law. This makes it illegal to engage in the business of loaning money at a greater rate of interest than 6 per

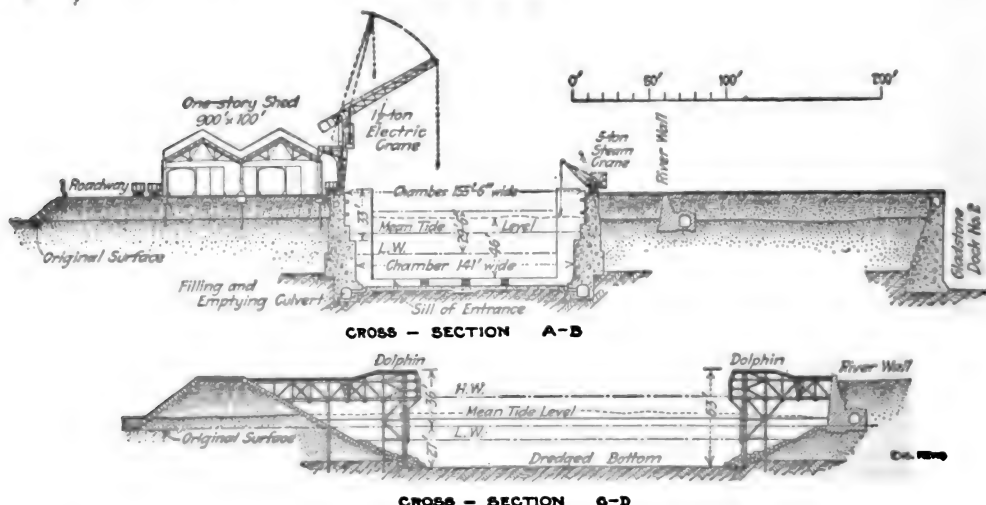

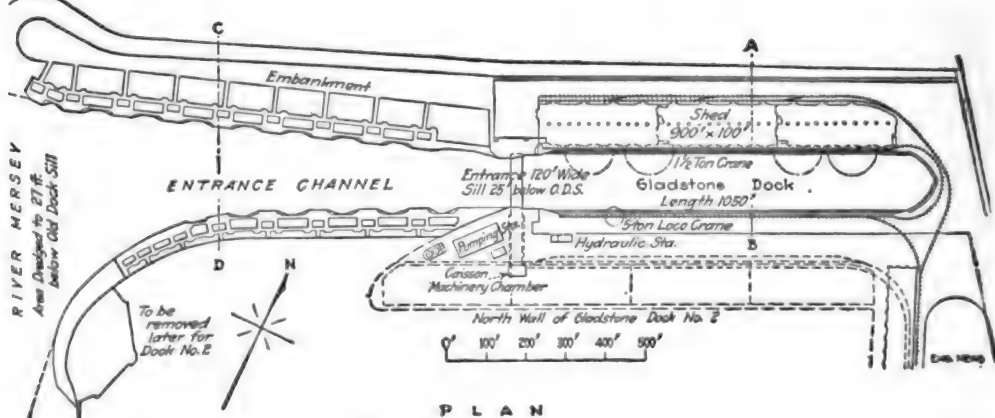

cent. per annum, without procuring a license which is granted only after public hearing. Licensee is to give a bond for \$5000. Loans may not be made at a higher rate of interest than 1 per cent. per month, and then shall include all fees, expenses, and charges of every kind. The interest may not be deducted from the loan when it is made. Violations of this law are punishable by fine or imprisonment, or both.

DIVORCE. See MARRIAGE AND DIVORCE.

DOANE, WILLIAM CROSWELL. A bishop of the Protestant Episcopal Church, died May 16, 1913. He was born in Boston in 1834; graduated from Trinity College in 1863; and ordained priest in 1866. From 1868-60 he was rector of St. Mary's Church, Burlington, N. J.; from 1860-64 of St. John's Church, Hartford, Conn.; in 1867 of St. Peter's, Albany, where he remained until he became bishop of Albany in 1869. Bishop Doane was identified with the so-called high church branch of the Protestant Episcopal Church, and was the only bishop in the United States to wear the clerical garb of the bishops of the Church of England. He was the author of *Life and Writings of the Second Bishop of New Jersey* (1862); *Mosaics, or the Harmony of the Collect, Epistle and Gospel for the Sundays of the Christian Year*; *Sun-*

shine and Playtime, and *Rhymes from Time to Time*.

DOCKS AND HARBORS. The approaching completion of the Panama Canal and the anticipated increase in commerce aroused great activity in the improvement of harbor and port facilities on the Pacific coast. At San Francisco a few years previous bond issues of \$9,000,000 and \$1,000,000, the latter for the purchase of tide lands, had been voted and work was in progress of improving the water front, a comprehensive scheme of piers and interconnecting railways having been developed. The decision of the harbor commission of the State of California to substitute wooden wharves for some of the concrete piers originally intended, provoked considerable discussion. It was claimed that the provision of more extended facilities for the same money was an improper consideration and that the mud of the harbor was insufficient to stand the weight of concrete docks, while the disintegrating effect of water upon concrete structures was also to be considered. In view of the failure of a timber dock in San Francisco harbor and the fact that the best creosoted piles in San Francisco harbor have a life of but 12 to 15 years and the bond issues for wharf construction run for 75 years, the wisdom of the

THE NEW GLADSTONE WET AND DRY DOCK, LIVERPOOL, ENGLAND. OPENED 1913.

harbor commission in deciding for timber structures that would have to be replaced five times during the life of the bonds, was assailed. The question was an open one during the year as great commercial activity was expected for the port.

GLADSTONE DOCK. During the year there was completed at Liverpool, England, the largest dry dock ever built. This new dock was 1050 feet in length and 120 feet high at the entrance, with a centre sill affording a depth of 46 feet at high tide and 35 feet at the lowest tide. The dock was designed for the large liners which use Liverpool harbor, especially the new Cunard liner *Aquitania*. As there is a range of tide in the Mersey at Liverpool of nearly 28 feet it is necessary to provide locks there, or wet docks where steamships of any size are loaded, or unloaded. Consequently, as in the case of the new Gladstone dock, what is ordinarily a wet dock can be used as a dry dock for the inspection and repair of the hull of vessels by pumping dry the water. The improvement further involved the excavation of an entrance channel about 1200 feet in length and 400 feet wide at its entrance, which diminishes to 120 feet in width at the entrance to the dock proper. This entrance has a chamber 155 feet 6 inches in width at the top and 140 feet wide at the bottom and provides a working chamber 120 feet wide, 1020 feet long, and 46 feet deep. A portion of the embankment of the entrance channel will later be removed to give place to dock No. 2. The side walls of the dock are of solid concrete founded on bed rock and the bottom of the dock is also of concrete 3 feet 6 inches in thickness. The entrance is closed by a sliding caisson, as the limited space

prevented the use of gates. This caisson is of steel, 124 feet long on the outer face and 132 feet long on the inner, with a width of 25 feet. The maximum head acting against it in still water will be about 46 feet. It is moved by means of steel ropes connected with electric motors on the masonry at the south end of the caisson recess. A temporary float, or ship caisson, is provided should the main caisson require removal at any time for repairs or otherwise. The pumping plant consists of five sets of centrifugal pumps having discharge pipes 54 inches in diameter, each driven directly by a vertical four-cylinder Diesel engine of 1000 horse power capacity. These pumps will empty the dock of its entire contents, about 44,000,000 gallons, on an 18-foot tide, in two and a half hours. A one-story shed, 900 feet in length and 100 feet in width, is located on one side of the dock and electric cranes and a five-ton steam crane run on special rails along the side and around the head. There are two hydraulic capstans at the ends, each capable of hauling 20 tons and six 1-ton hydraulic capstans on the sides.

BOSTON DRY DOCK. In connection with the developments in progress for the port of Boston plans were prepared for a new dry dock which was to be the largest in the world and able to accommodate the largest transatlantic steamers, several of which were expected to make Boston their destination. The dimensions provided for in the plans were as follows: Total length over all, 1200 feet; available interior length, 1162 feet; bottom entrance width, 120 feet; depth of water at outer sill, 44.8 feet at mean high water.

DRY DOCK AT LEVIS ON THE ST. LAWRENCE RIVER, OPPOSITE QUEBEC. UNDER CONSTRUCTION, 1913.

A large dry dock was put under construction by the Canadian government on the St. Lawrence River, near Levis, Quebec. It was to have the following dimensions: Length from caisson stop to head wall, 1150 feet; width of entrance, 120 feet; depth on sill at ordinary high water, 40 feet. It was to be divided in two parts, 650 and 500 feet respectively, the outer entrance was to be closed by a steel rolling caisson, and a floating caisson will close the inner entrance. The pumping plant for emptying the dock was to consist of three electrically-driven centrifugal pumps, each having a capacity of 60,000 gallons per minute, supplied with current from three turbo-generators.

BELGIUM. The improvement of the harbors and waterways of Belgium continued to progress during 1913 and the extent of the work may be realized when it was stated that in the previous 20 years Belgium had expended over \$80,000,000 on the ports of Antwerp, Ostend, Brussels, Bruges, and Zeebrugge. To connect Liege and Antwerp it was proposed to widen the Brussels-Charleroi Canal at an expense of about \$2,000,000, while a canal $7\frac{3}{4}$ miles in length connecting the Louvain Canal with Hasselt, a distance of 31 miles, was proposed in order to give Antwerp and Brussels communication with Hasselt in view of the opening of the Campia coal field. The port improvement at Antwerp continued, involving the change of the channel and the construction of a new basin designed especially for grain ships with four elevators. At Zeebrugge further work was in progress towards deepening the channel, while at Nieuport additional harbor works were proposed. At Ghent deep water quay accommodations for over eight miles had been developed and basins, the last of which had a depth of 28 feet, had been provided for a water area of 247 acres. The canal had been deepened and other improvements made so that Ghent was second to Antwerp as a harbor and canal centre, with a tonnage amounting to nearly a million tons. Vessels drawing 26 feet and 460 feet in length were able to pass through all the locks.

GERMANY. The channel of the Weser at the port of Bremen was being deepened during the year from $16\frac{1}{2}$ feet to 23 feet and also increased in width, while new grain piers and elevators capable of landing 800,000 tons a year were being added. The river Oder, below Breslau, was being improved in order to provide for the traffic between Silesia and Berlin and Stettin, while at Emden the Prussian government was improving the harbor, deepening the outer harbor to 37 feet, and constructing an inner harbor and lock, which was opened to traffic in October, 1913. This new lock connects the inner harbor with the river Ems and is 833 feet in length by 131 feet in width, and 43 feet deep. These improvements were due to the increased traffic carried by the Dortmund-Ems Canal.

HOLLAND. During the year the Port Authority decided to construct at Amsterdam a new basin 11,000 feet in length, with a depth of 34 feet and a second lock at the entrance from the North Sea 1180 feet in length, 131 feet wide, with a depth of 46 feet. These improvements would require from seven to eight years for their completion.

There was under construction during the

year the improvement of the navigation between Rotterdam and Liege on the river Meuse for a length of 100 miles, including the deepening of the channel and the construction of locks long enough to accommodate the large barges of the Rhine. This proposition involved joint action by the Belgian and Dutch governments and was a matter of considerable interest as the construction of a new canal on Dutch territory was possible.

FRANCE. The Floods Prevention Commission recommended the deepening of the channel of the Seine and when this is done large steam motor barges will be able to pass from Paris to Rouen. The plan adopted gives a channel 14 feet 9 inches between Suresnes and Bourguival at an estimated cost of \$6,250,000. A new dam was to be built at Bourguival and the one at Bezout was to be done away with. Extensive improvements were in progress at Rouen where the traffic had increased in 1913 to $2\frac{1}{2}$ million tons from 1 million tons in 1900, while at Havre improvements were necessary in order to hold the trans-Atlantic traffic which was going to Southampton when repairs were necessary for the largest ships. It was proposed to extend the southern jetty about 2 miles and to construct a second outer harbor and tidal dock. These works would require for their completion about five years and will involve a cost of some \$16,000,000. Improvements at Bordeaux were also in progress and contemplated so that the channel depth, which is now sufficient for steamers drawing 22 feet would be increased by about 5 feet.

THE KING'S DOCK, the largest in the Far East, was opened at Singapore, Straits Settlements, on August 26, 1913. It is situated in Keppel Harbor at Singapore, and has a length of 852 feet over all, with a length of 800 feet on the blocks and it can be divided by means of an intermediate caisson into two compartments, one 486 feet and the other 325 feet in length. It has a width of 100 feet at the entrance. Between the coping stones and the body of the dock there is a distance of 128 feet, while the width of the floor is 90 feet. At low water the depth on the sill is 25 feet and at high water 34 feet, and the approaches are dredged to a depth of 33 feet below low water. See also CANALS.

DODD, AMZI. An American lawyer, died January 22, 1913. He was born in Bloomfield, N. J., in 1823, and graduated from Princeton College in 1841. In 1848 he began to practice law in Newark, and in 1871 was appointed vice-chancellor. He took an active interest in politics. In 1856 he was defeated for Congress. Prior to going on the chancery bench he served as a member of the New Jersey Assembly, and served afterwards a second term, beginning in 1881. This was cut short by his election to the presidency of the Mutual Benefit Life Insurance Company of Newark, a post which he filled for twenty years. From 1872-82 he served as one of the special justices of the Court of Errors and Appeals.

DOMINICA. A presidency of the Leeward Islands (q.v.). Roseau (6577 inhabitants) is the capital. A favorable soil and climate adapt the island to the cultivation of various crops; but much of the land is untitled. Many of the coffee plantations have been abandoned on account of marauding maroons and plant

disease; the depreciation in sugar has led to a reduction in the area under cane. Other products are cacao, (export 1911, 10,055 cwt.), limes and lime juice (£49,221), citrate of lime (£19,260), essential oils (£2309). External trade (calendar years) and finance (fiscal years) statistics for the presidency follow:

	1908-9	1909-10	1910-11	1911-12
Imports	£153,114	£128,779	£147,322	£164,695
Exports	112,013	102,339	112,111	124,878
Revenue	41,147	39,521	42,133	44,054
Expenditure...	37,178	41,860	39,603	38,792
Shipping*	746,640	713,227	694,986	642,809

* Tonnage entered and cleared.

Customs revenue (1911-12), £23,486. Public debt, £46,267. W. Douglas Young was administrator in 1913. The census (1911) returns about 470 Caribs in the island, 170 of pure blood. The majority of the population is negro. See LEEWARD ISLANDS.

DOMINICAN REPUBLIC, or SANTO DOMINGO. An independent state occupying the eastern part of the island of Haiti. The capital is Santo Domingo.

AREA, POPULATION, ETC. The estimated area is 48,577 square kilometers (18,756 square miles). Population by provinces (1913): Azua, 66,500; Barahona, 28,000; El Seibo, 51,000; La Vega, 83,000; Espaillat (Moca), 52,500; Monte Cristi, 36,000; Pacificador, 52,500; Puerto Plata, 49,000; Samaná, 12,000; San Pedro de Macoris, 24,000; Santiago, 194,000; Santo Domingo, 166,000; total, 724,500. Estimated population of the larger towns: Santo Domingo, 22,000; Santiago, 20,000; Puerto Plata (the chief port) and San Pedro de Macoris, 15,000 to 16,000 each; La Vega, 10,000 Sánchez, Samaná, Azua, and Monte Cristi, 4000 to 5000 each. In 1911 there were reported 27,407 births, 6603 deaths, and 2442 marriages. In 1911 there were 590 schools, with 20,453 pupils (boys and girls in nearly equal numbers).

PRODUCTION AND COMMERCE. Agriculture, together with cattle-raising, is virtually the only source of national wealth, as mining and manufacturing are little developed. The leading crops are sugar and cacao; other crops are tobacco, coffee, cotton, and bananas and other fruits. There is a considerable output of honey.

Imports and exports have been valued as follows, in American dollars:

	1909	1910	1911	1912
Imports..	\$4,425,913	\$6,257,691	\$6,949,662	\$8,217,898
Exports..	8,113,690	10,849,623	10,995,546	12,385,248

Leading imports in 1911 and 1912 respectively, in thousands of dollars: Iron and steel, 998 and 1627; cotton manufactures, 1617 and 1608; rice, 540 and 773; wheat flour, 407 and 453; meat and dairy products, 415 and 421; wood and manufactures thereof, 256 and 343. The chief exports are raw sugar and cacao; these exports have been as follows: In 1909, sugar \$3,304,931 and cacao \$2,759,191; in 1910, \$5,590,536 and \$2,849,585; in 1911, \$4,159,733 and \$3,902,111; in 1912, \$5,841,357 and \$4,248,724. Other exports in 1911 and 1912 respectively, in thousands of dollars: Leaf tobacco, 1421 and

670; coffee, 319 and 566; beeswax, 165 and 149; cattle hides, 104 and 122; bananas, 195 and 112; cotton, 47 and 102; goatskins, 80 and 97; honey, 59 and 77; lignum vitae, 61 and 63. The trade by countries has been as follows, in thousands of dollars:

	Imports		Exports	
	1911	1912	1911	1912
United States.....	4,120	5,100	5,751	7,275
Germany	1,266	1,628	2,947	1,774
United Kingdom.....	776	720	764	1,243
France	213	225	1,081	938
Spain	152	150
Italy	139	131	9	27
Porto Rico.....	85	42	52	48
Cuba	8	7	21	15
Other	189	215	371	1,070
Total	6,950	8,218	10,996	12,385

Vessels entered at the ports in the foreign trade in 1912, 599, of 641,548 tons (323 steam, of 379,539 tons), and cleared 477, of 379,147 tons (263 steam, of 356,124 tons). Merchant marine, 11 sail, of 1541 tons.

COMMUNICATIONS. A railway extends from Puerto Plata, on the north coast, to Santiago and thence to Moca. Another line extends from the eastern port Sánchez, on the Bay of Samaná, west to La Vega. A branch of the latter line runs north from Jina to San Francisco de Macoris, and another branch north from Cabullas to Salcedo. Salcedo is only a few kilometers east of Moca, so that construction of the short line of railway necessary to connect these town will effect rail communication between Puerto Plata and Sánchez. Length of railways, 282 kilometers (175 miles). In addition, there are private lines for the larger sugar plantations reported at 362 kilometers (225 miles). A line is projected to connect Manzanillo and La Vega; in the autumn of 1913 it was reported that a contract had been signed for the construction of a line from San Pedro de Macoris to San Lorenzo Bay. In 1913 the government undertook the improvement and extension of wagon roads. There are over 100 post offices.

FINANCE. The budget for 1912 balanced at \$4,208,400. In 1910 revenue and expenditure were \$4,705,738 and \$4,645,287 respectively. Of the receipts in 1910, customs provided \$3,121,642; imports and taxes, \$475,058; railways, \$284,422; and port dues, \$60,366. The larger departmental disbursements were:

Finance and commerce, \$1,939,106; interior, \$670,453; war and marine, \$521,360; public instruction and justice, \$391,867; *fomento* and communications, \$238,929. A treaty between the Dominican Republic and the United States authorized a loan of \$20,000,000 for the conversion of the debt and established an American receivership of customs, from April 1, 1905. Obligations are met promptly.

GOVERNMENT. The legislative power is vested in a congress consisting of the Senate (12 members, elected for six years) and the Chamber of Deputies (24 members, elected for four years). According to the constitution, the president is elected by indirect vote for six years. Gen. Ramón Cáceres, who was installed as president in 1906 to complete his predecessor's term and was inaugurated for a full term July 1, 1908, was shot and killed by an assassin November 19, 1911. On the 2d of the month

following Eladio Victoria, a senator, was elected provisional president by the Congress, and president February 2, 1912. He was inaugurated February 28; influenced by revolutionary outbreaks, he resigned in November, 1912, and on December 2, Archbishop Adolfo Alejandro Nouel was elected provisional president. Nouel resigned early in 1913, and Gen. José Bordas Valdés was elected provisional president, assuming office April 14, with the following cabinet: Gen. Julian Zorilla, minister of the interior; Ramón O. Lovaton, foreign affairs; Mario A. Savifon, treasury and commerce; Apolinar Tejera, justice and education; Gen. Tadeo Alvarez, war; Ricardo Limardo, fomento and communications; Enrique Montes de Oca, agriculture.

HISTORY. One of the first measures taken up by the new cabinet of 1913 was the elaborate plan of Sr. Limardo for the construction of roads, bridges, and drains throughout the republic. A project for a railway to run from Manzanillo bay to Concepcion de la Vega was approved by the Senate, and promised materially to increase the meagre railway facilities of the country. The minister of war, Gen. Alvarez, also came forward with proposals. He wished to modify the army law so that the period of service would be four years for illiterates and two for literates. The decimal system of weights and measures was put into effect on August 1; new census was begun on June 22; and a pure food law was enacted.

The government lacked support, however, and during the summer months it became evident that trouble was brewing in the north. Finally actual revolt broke out and during September the rebel General Horacio Vasquez entrenched himself in Puerto Plata, on the northern coast, and gained control of the neighboring portion of the railway, which by the way, had much to do with the trouble.

The government could not quell the rebellion, although the bombardment of Puerto Plata was begun; and it became necessary for British and American ships to protect the interests of foreigners in Puerto Plata. On September 9, Mr. James M. Sullivan, newly appointed U. S. minister to Santo Domingo, left Washington to confer with the rebel leaders. He succeeded in convincing Gen. Vasquez and Gen. J. Cespedes that the United States would be unfavorable to a successful revolution and would refuse the payment of customs collections to a revolutionary government. This threat, together with a guarantee against reprisals and a promise of free elections, induced the rebels to capitulate on October 21, a new revolutionary plot was detected and frustrated in November, when a large consignment of ammunition destined for the rebels was discovered and confiscated in New York.

On December 15 elections were held for a constituent assembly, which should revise the constitution. It had been the intention of Mr. Sullivan, in accordance with his assurances to the rebels, to send Americans to "watch" at the polls in the interest of fairness; this intention he expressed in a note of December 3. The Dominican government, however, replied that "President Bordas could not, without violating the fundamental covenant which governs us, admit officially interference of a foreign element into our body politic in matters of

internal concern pertaining to the exercise of national sovereignty." The watchers were, therefore, not recognized officially, nor admitted to the polls, but treated simply as "tourists." The constituent assembly was to meet in January, and a session of Congress was called for January 4, to discuss the validity of the elections in cases where the opposition candidates withdrew from the contest.

DORR, JULIA CAROLINE RIPLEY. An American poet, died January 18, 1913. She was born in Charleston, S. C., in 1825. Her mother died when she was still an infant and she was taken by her father to Vermont in 1830. In 1847 she married Seneca R. Dorr. From 1848 she was a prolific writer for periodicals; fifteen volumes of her prose and verse have been published. She gained a reputation as a poet, but was almost as famous because of her friendship for the famous men and women of the middle of the nineteenth century. She belonged to the famous Cambridge group, which included Emerson, Holmes, Longfellow, Lowell, Julia Ward Howe, and many others. These persons were frequent visitors at her home in Vermont. Among her published works were: *Farmingdale; Landmere; Sibyl Huntington; Bride and Bridegroom; Friar Anselmo* (1879); *Afternoon Songs* (1885); *Poems Complete* (1892); *The Flower of England's Face; Afterglow* (1900); and *Beyond the Sunset* (1909).

DOUGLAS, SIR ARCHIBALD. An English admiral, died March 5, 1913. He was born at Quebec, Canada, in 1842, and entered the navy in 1856. From 1873-5 he was director of the Imperial Japanese Naval College in Yedo. He was afterwards appointed a member of the ordnance committee, until he was given command of the *Edinburgh* in the Mediterranean in the autumn of 1890. In 1898 he was made commander-in-chief in the East Indies, but a year later resigned this command to become second sea lord in the admiralty. He was appointed commander-in-chief in the North America and West Indian station in 1902, having in the meantime been promoted to be vice-admiral. After his return from the North American command he was made commander-in-chief at Portsmouth, a post to which no officer of his rank had been appointed for forty years. In 1905 he was promoted to be admiral, and in 1907 retired from active service.

DOUMERGUE GASTON. See *Doumergue Ministry*, under FRANCE, *History*.

DOWINE. See VETERINARY SCIENCE.

DOWDEN, EDWARD. An English scholar, literary critic, and educator, died April 4, 1913. He was born in Cork, Ireland, in 1843, and was educated at Trinity College, Dublin. His career at the university was brilliant. He won the vice-chancellor's prizes for English verse and English prose and was president of the Philosophical Society. Four years after his graduation, when only twenty-four years of age, he was appointed professor of English literature in Dublin University, a chair which he held until the time of his death.

His great interest was in Shakespeare, and he conceived the idea of a book in which the study of Shakespeare's works should be connected with a quest for the personality of the author, and which should include, as far as possible, observation of the growth of his intellect and character from youth to maturity. This re-

sulted, in 1875, in the publication of *Shakespeare: His Mind and Art*. It was followed, in 1877, by a *Shakespeare Primer*. In 1889, he gave his first series of Taylorian lectures at the University of Oxford. From 1893-6 he served as Clark lecturer at Trinity College, Cambridge. In the latter year he also delivered a course of lectures on the French Revolution and English literature at Princeton University. He received a degree of LL. D. from this university, following the delivery of the lectures.

In the meantime he had written other books, among them a notable *Life of Shelley*, published in 1886. He continued to write books dealing with English and other literatures. Notable among his works, in addition to those already mentioned, are: *Poems* (1876); *Studies in Literature* (1878); *Transcript and Studies* (1888); *Introduction to Shakespeare* (1893); *New Studies in Literature* (1895); *A History of French Literature* (1897); *Robert Browning* (1904); *Michel de Montaigne* (1905); *Essays: Modern and Elizabethan* (1910). He also edited *Shakespeare's Sonnets*; *Southey's Correspondence with Caroline Boules*, and the *Correspondence of Henry Taylor*, the poetical works of Shelley, Wordsworth, and Southey, and edited some of the most important plays of Shakespeare.

DRAESEKE, FELIX. A German composer, died February, 1913. He was born in Coburg, in 1835, and studied music at the conservatory in Leipzig, afterwards going to Weimar, where he became one of the enthusiastic admirers of Liszt. He also became friendly with Von Bülow and went to Dresden, where from 1864-74 he was head of the Lausanne Conservatory. In 1874 he succeeded Wüellner at the Dresden Conservatory. Here he remained for several years and received many honors from the royal family. He wrote several operas which enjoyed popularity, and some religious music.

DRAINAGE. UNITED STATES. An indication of the growing interest in reclamation of wet and overflowed lands was the number of drainage laws and amendments passed in the various States. Massachusetts made an initial appropriation of \$15,000 for reclaiming wet lands; Michigan was to submit to the people a constitutional amendment authorizing counties to issue bonds for drainage and other agricultural enterprises; Vermont authorized municipalities to issue bonds for long-time loans to farmers for drainage works. Idaho provided for the organization of drainage districts, but the act was declared invalid. The drainage laws of Missouri and Washington were revised, and changes were made in the laws of Illinois, Indiana, Iowa, Kansas, Nebraska, South Dakota, Oregon, and Utah. Nevada authorized its counties to drain swamp lands dangerous to health.

In North Carolina there are some scores of districts for draining swamp lands in the Coastal Plain and overflowed areas in the Piedmont section. In South Carolina, districts were organized in Hampton and Jasper counties and in Horry County; Charleston County was being divided into drainage units. Plans were prepared for a district in Ware County and a survey was made near Baxley, in Georgia. The State of Florida had dredges excavating large canals in the Everglades, but eminent engineers have reported the drainage plans inadequate.

The State Geological Survey published plans for reclaiming large areas of overflowed lands along the Kaskaskia and Embarrass Rivers, in Illinois. Contract was let for digging one of the big diversion ditches for Cypress Creek, in Desha County, Arkansas. In 1913 there were at least 42 projects under way for draining low coastal lands in Louisiana, aggregating 248,700 acres: there were mostly private corporations, rather than districts organized under the drainage laws. Plans were made dividing Jefferson County, Tex., into 33 drainage districts, some of which would require pumping plants. Construction was begun in one district. Tile drainage was rapidly being introduced into the southern and eastern States. In the upper Mississippi valley, large tile was being much used instead of open ditches.

The greater part of the western irrigated lands must be artificially drained to prevent water-logging and the concentration of injurious salts. The United States Reclamation Service was planning drainage systems for many of its irrigation projects, to correct or to prevent injury. In the Yakima Valley, Wash., districts were constructing open ditch and large tile drains; in places the work is very costly, owing to the almost fluid condition of the saturated soil. In the San Luis Valley, Col., where high cost has deterred many districts from undertaking drainage work, the progress of the Carmel drainage district gave indication of highly satisfactory results. The endeavor was being made to have this whole valley cooperate to secure a large outlet drain. The four drainage districts in the Pecos Valley, N. M., were waiting for a court decision as to the validity of the statute. Construction was begun for draining injured lands near Safford, Ariz., in the Gila Valley. The drainage of individual farms in western States was becoming increasingly common. The California experiment station undertook a thorough study of the needs and methods of drainage, in cooperation with the United States Department of Agriculture.

FOREIGN COUNTRIES. A project is under way for reclaiming 26,000 acres on the Columbia River, south from Golden, British Columbia, partly by the use of dikes, and a similar reclamation on that river near Ivermere, B. C., was being considered. Work on the Roque Canal in Matanzas Province, Cuba, 31 miles long, was about 20 per cent. completed. More than a thousand acres are already reclaimed and planted to cane, and the completed project will drain 27,000 acres, including the Majoguila and Guayabeque swamps. The ministry of agriculture of Argentina has established an office for the study of the problems and methods of irrigation, drainage, and related agricultural improvements. It was estimated that \$3,600,000 would be required to complete the surface drainage works in Buenos Aires Province, Argentina. The drainage of Navarro Laguna is also being considered. In Hawaii, contracts were let for filling the low lands of Kewalo, Honolulu.

The reclamation of marsh lands in Holland continues at the rate of 20,000 to 25,000 acres per year; yet it is stated authoritatively that there are 250,000 acres of the best soil under waste waters—not including the areas of rivers, canals, or the Zuyder Zee. A recent plan for draining the Zuyder Zee—a scheme 50 years old—proposed an embankment, 182 miles long,

to enclose 523,000 acres of drained lands and a lake of 358,000 acres to store the flow from rivers when high tides prevent flow into the sea. The total cost was estimated at \$75,000,000, exclusive of interest, the time of completion 33 years, and the first land to be fit for cultivation in 17 years. The Russian government was reported to have appropriated \$14,800 for investigating the prevention of overflow in the delta of the Terek River, in the North Caucasus. In Roumania, the reclamation of 40,000 acres of swampy land along the Puth, by diking, is being considered.

Work progressed on the project for draining a million acres in northern Egypt. The parliament of South Australia passed a loan bill, including items for irrigation and drainage, \$1,240,000, and for drainage in the southeastern district, \$250,000. Dredging, in progress in Kashmir, India, has lowered the surface of Woolar Lake 6 feet. It was to be lowered 8 feet more, reclaiming 90,000 acres in all, estimated worth, \$7,200,000 for agriculture, at a cost of \$3,100,000. Progress was made in draining Bapatla swamps, on the Appapuram scheme in the Kistna delta, and on the Yenemadurn drain of the Godivari system, in south India. In the Korning district of Kwangtung Province, south China, an American firm installed five pumps, each of 5000 gallons per minute discharge, for draining rice fields, and three irrigation pumps. Although the season was unusually wet, an early rice crop was harvested, and this success has led to other similar contracts with the same firm.

DRAKE, JAMES MADISON. American soldier and journalist, died November 29, 1913. He was born in Somerset County, N. J., in 1837. In 1853 he became editor of a newspaper in Trenton, N. J. In 1857 he started *The Evening News* in Trenton, and in 1860 the *Wide Awake*. He enlisted in the Union army, and served until 1865. Taken prisoner at Drury's Bluff, Va., in 1864, he escaped from prison in Charleston, S. C., and after a tramp of 1000 miles reached the Union lines at Knoxville, Tenn. He was awarded a congressional medal of honor for distinguished gallantry, and was brevetted brigadier-general by special act of the legislature of New Jersey. From 1868 to 1881 he was publisher of the *Daily Monitor* at Elizabeth, and from 1882 to 1887 published the *Elizabeth Sunday Leader*. He was publisher of the *Elizabeth Daily Leader* from 1887 to 1900. He was author of: *Fast and Loose in Dixie*; *Across the Continent in Red Breeches*; *Historical Sketches of the Revolutionary and Civil Wars*, and *New Jersey in the War for the Union*.

DRAMA, AMERICAN AND ENGLISH. The theatre season of 1913, in both America and England, was comparatively barren of artistic achievement, and, from the box-office standpoint, the worst for a decade. As a matter of history, the most interesting phenomenon of the theatrical year was an unprecedented movement, instituted in America, toward the frank discussion of subjects which had formerly been forbidden in the theatre. This movement was unintentionally started, in the month of March, by Richard Bennett, when he organized a company for the presentation of *Damaged Goods*, an English version of *Les Avariés*, by Eugène Brieux. This work, by the greatest living dramatist

of France, is a study of the disease of syphilis in its bearing on marriage. The piece was first presented in New York at two private matinées, conducted under the auspices of the Sociological Fund of the *Medical Review of Reviews*; but it was soon presented publicly as the regular bill of the Fulton Theatre. It ran for three months to crowded houses; and, throughout the remainder of the year, it was acted, with undiminished success, in nearly all the leading cities of the country.

But less disinterested managers soon strove to turn to their own profit the awakening of public interest in the social evil; and, in the autumn season, the theatre was flooded with plays purporting to reveal the hitherto hidden secrets of the seamy side of life. The first of these plays, *The Lure*, was produced in August. It was a scarcely skillful melodrama, written by a new author, George Scarborough, who had been engaged for some years, as a Federal agent, in combatting the so-called "white slave traffic." *The Lure* was written with evident sincerity; and if, in certain passages, it seemed untrue to life, it was only because of the author's lack of practice as a playwright. Bayard Veiller, the author of *Within the Law*—a melodrama which ran uninterruptedly in New York throughout the entire year—wrote into his new play, called *The Fight*, a second act which was set in a brothel. In response to the protests of a certain section of the public, the police threatened to prevent further performances of both *The Fight* and *The Lure*. As a result of the public scandal, the brothel scene was removed from *The Fight*, and *The Lure* was rewritten in such a way as to eliminate the features that had been objected to. It is doubtful whether any good was effected by the acrimonious discussion that was stimulated by these plays; and the situation, as a whole, must finally be regarded as unfortunate for the American theatre.

Closely related to these plays was a melodrama called *To-day*, by George Broadhurst and Abraham S. Schomer, in which a husband finds out that his wife has been earning money by illicit intercourse with other men, and kills her in the house of assignation where he has discovered her perfidy. A less objectionable drama of this general type was *The Family Cupboard*, by Owen Davis. A husband and wife of mature years have drifted out of sympathy, and the husband has formed an alliance with a chorus-girl. The discovery of this intrigue breaks up the family, and the discarded chorus-girl resolves to be revenged upon her former protector by making his son fall in love with her. She succeeds in her purpose; and the crisis comes when the inexperienced youth discovers that the girl he loves has been formerly the mistress of his father. Somewhat allied to these plays in subject-matter, but not at all in spirit and in tone, was *Ourselves*, by Rachel Crothers. This piece sets forth the unsuccessful efforts of a philanthropic woman to reform a girl of the streets by taking her into her own home.

The impulse toward the production of children's plays, which was inaugurated during the fall of 1912, continued through the early months of 1913, and ultimately bore fruit in the finest theatrical achievement of the year. This was *The Poor Little Rich Girl*, a play of fact and fancy, by Eleanor Gates, a writer previously

DRAMATISTS AND PLAYERS PROMINENT IN 1913

known as a novelist, but unknown in the theatre. This play presented the unfortunate situation of a little girl withheld from real enjoyment of the life of childhood by the luxury with which she was surrounded. It exhibited an extraordinary knowledge of the psychology of childhood, and was an imaginative achievement of a high order. There was a successful production of this play in London, in December. Late in the year, the same author produced a second play, entitled *We Are Seven*, a whimsical farce, on the whole, disappointing. Inferior to *The Poor Little Rich Girl* was another play for children entitled *A Good Little Devil*. This piece was adapted from the French of Rosemonde Gérard and Maurice Rostand, the wife and the son of the famous author of *Cyrano de Bergerac*. The original text was written brilliantly in verse, and much of its wit and charm were sacrificed in an English prose translation. The piece, however, was beautifully produced by David Belasco.

The vogue of "crook" plays, which was started by the phenomenal success of *Within the Law*, continued, almost unabated, throughout the year. The most interesting of these melodramas of the underworld was *The Master Mind*, by Daniel D. Carter, which exhibited the machinations of a clever criminal who employed many minor "crooks" to do his bidding. *At Bay* was not a plausible, but still an entertaining, melodrama, written by George Scarborough, the author of *The Lure*. The heroine, caught in the toils of a blackmailing lawyer, stabs him with a paper-file; and she is assisted to escape the consequences of this assault by a genial Irishman, who plays fast and loose with the detectives of the United States secret service. The final "crook" play of the year was written by Roland Burnham Molineux. It was entitled *The Man Inside*; and it advanced a specious argument that society ought to assume toward the criminal classes an attitude not punitive, but reformatory.

Among the leading British dramatists, Sir Arthur Pinero remained silent throughout the year. Henry Arthur Jones made no production in America; but he published a serious play entitled *The Divine Gift*, and successfully produced in London a light comedy called *Mary Goes First*. This witty piece, which deals with the ambition for social precedence, was delightfully acted by Marie Tempest. George Bernard Shaw produced two failures in London—one of which, *Androcles and the Lion*, is likely to be remembered among his works. His *Cæsar and Cleopatra* was revived in America by Sir Johnston Forbes-Robertson; and late in December, his early comedy, entitled *The Philanderer*, was imported to New York with a company rehearsed by Granville Barker. The performance was not notable; and the play itself, in comparison with Shaw's later compositions, seemed monotonous and dull. James Matthew Barrie was made a baronet in the spring. His new play, *The Adored One*, mystified the public and the critics of London, and failed to achieve his usual measure of success. Barrie's chief contribution of the year consisted of two one-act plays, entitled, *Half an Hour* and *The Will*. Both of these compositions revealed an acrid disenchantment which seemed all the more discomforting as coming from the author of *Peter Pan*. Stanley Houghton, the gifted author of

Hindle Wakes, contributed a new comedy, entitled *The Younger Generation*, the theme of which was the familiar axiom that "crabbed age and youth cannot live together." This piece was somewhat thin in substance, but it exhibited an extraordinary technical accomplishment. This talented young writer—the leader of the new realists in England—died at Manchester in the month of December; and the loss of his admirable mind must be recorded as the greatest set-back which the English theatre suffered during the course of 1913. *Prunella*, a Pierrot-play in prose and rhyme, by Lawrence Housman and Granville Barker, which had previously been exhibited in London, was produced at the Little Theatre in New York. In sheer beauty of visual projection, this production was the most poetic achievement of the year. The most successful play of the London season was *The Great Adventure*, a dramatic version by Arnold Bennett of his own novel, entitled *Buried Alive*. This play was novelistic in structure, but it held the interest from the outset to the end. It was deeply true in characterization, and humorously human in dialogue. In New York, it was less successful when it was imported by Winthrop Ames to open his new theatre, called the Booth. An attempt had been made by David Belasco to forestall the appeal of the piece by the previous production of a play with a somewhat similar theme. This play, entitled *The Temperamental Journey*, was adapted by Leo Ditrachstein, from the French of André Rivoire and Yves Mirande. The second most successful play of the London season was also presented less successfully in America. This was *General John Regan*, written by Canon Hannay, of St. Patrick's, Dublin, a writer new to the theatre who had previously published several novels signed with the pen-name of "George A. Birmingham." The piece is nothing more than an amplified anecdote, wherein the technical method employed by Lady Gregory in her one-act plays has been extended to cover a three-act comedy; but it is developed with extraordinary richness of characterization and written in a dialogue that is unusually humorous. Among minor works by established British playwrights must be mentioned *The Land of Promise*, in which W. Somerset Maugham made a scarcely successful blending of the themes of *The Great Divide* and *The Taming of the Shrew*, and *Tante*, a dramatization by C. Haddon Chambers of a novel of the same name by Anne Douglas Sedgwick, in which Ethel Barrymore was afforded an opportunity for a notable performance of a woman suffering from the egotistical perversity of disposition which is popularly termed the "artistic temperament."

Among continental plays produced in English during the course of the year, the most important was *La Flambee*, by the Belgian playwright, Henry Kistemaekers, which was acted in London under the title of *The Turning Point*, and in New York under the title of *The Spy*. The piece, however, was badly acted in New York, and failed to achieve the success that was warranted by its technical dexterity. Late in the year, Henry Bernstein's *The Secret*, which had been acted in Paris by Mme. Simone, was reproduced in America by David Belasco. It was a work of astonishing technical accomplishment, but, like most of Bernstein's plays, it was lacking in the element of human sympathy.

The Five Frankforters, which had been favorably received in Germany, was acted in both England and America. This domestic comedy by Carl Rossler, purported to narrate an episode in the early history of the Rothschild family. *Where Ignorance is Bliss*, a comedy translated from the Hungarian of Ferenc Molnar, failed flatly in New York. It was technically clever; but it was too mechanical in its theatricalism to interest the American public.

Next to *The Poor Little Rich Girl*, the best American play of the year was *Romance*, by Edward Sheldon. In this work, the talented author shifted from the realistic to the romantic method and surpassed all his previous productions. The play detailed a love-affair between a prima donna of somewhat wide amatory experience and a young minister of the gospel who had had no previous experience with women. *Peg O' My Heart*, by J. Hartley Manners, was the most successful American production of the season. It ran throughout the entire year, without even an intermission in the summer. It was, however, merely a common-place comedy in which the crude manners and true heart of an uncultivated Irish girl were contrasted with the finished manners and shallow hearts of her wealthy English relatives. Augustus Thomas scored another failure with *Indian Summer*, a skilfully planned and ably written play which discussed too many themes that were apparently unrelated to each other, and therefore made a scattering impression. *Fine Feathers*, by Eugene Walter, was an effective fabric, but it seemed more artificial and less human than this author's earlier plays. A new pair of collaborators, Charles Goddard and Paul Dickey, came forward with two plays, *The Ghost-Breaker* and *The Misleading Lady*. Both pieces exhibited considerable ingenuity in theatrical invention; and the latter, the better of the two, discussed a serious theme. In *The Strange Woman*, which was beautifully played by Elsie Ferguson, William J. Harlbut set forth a sharp contrast of character between an accomplished woman of the world and the provincial and narrow minded inhabitants of a little town. *The Marriage Game*, in which Anne Crawford Flexner argued that married women should continually exert themselves to retain the affections of their husbands, was mildly entertaining; and in *The Things That Count*, a new writer, Lawrence Eyre, furnished a pleasant little sentimental comedy for the Christmas season.

Among the lighter plays of American authorship, the most ingenious was a melodramatic farce, entitled *Seven Keys to Baldpate*, which was dramatized by George M. Cohan from a novel by Earl Derr Biggers. A flippant and entertaining farce, entitled *Believe Me, Xantippe*, was produced by a new writer, Frederick Ballard, the latest graduate of the Harvard school of playwrights. The highly successful stories by Montague Glass, which set forth the personal problems of *Potash and Perlmutter* were successfully compounded into a play by an unannounced collaborator. The last spectacle that was presented at the Century Theatre before that institution was turned over to the production of opera in English was a Biblical play by Louis N. Parker, entitled *Joseph and His Brethren*. This panoramic narrative was subsequently reproduced in London by Sir Herbert Tree.

A new small and successful theatre, the Princess, was opened in New York for the express purpose of producing one-act plays. The policy of the house was patterned after that of the Grand Guignol in Paris. The dozen diminutive dramas which were produced during the course of the year all fell into two classes,—those designed to produce a shock of horror and those designed to induce a titillating sense of the imminence of impropriety.

Sarah Bernhardt made a record-breaking tour of America, appearing twice a day in a chain of vaudeville theatres. At each performance she gave a single act selected from one of the best-known pieces in her repertory. At the age of sixty-nine she still showed herself a master of the theatre and delighted a loyal public with her art. Another great performer, Sir Johnston Forbes-Robertson, was knighted in the spring, and embarked upon a farewell tour of the English-speaking countries. He made his final appearance in England at the Theatre Royal, Drury Lane, in the part of Hamlet, of which he is the greatest living exponent. Subsequently he played a farewell season in New York, adding the parts of Shylock and Othello to his classic repertory and appearing also in five modern plays. After a supplementary tour of the leading cities of the United States and Canada this great actor will withdraw permanently from the stage. Still another admirable actor, Cyril Maude, was welcomed to America in a repertory of notable impersonations.

DRAMA IN EUROPE. See FRENCH, GERMAN, ITALIAN, RUSSIAN, and SCANDINAVIAN LITERATURE.

DRAMA SOCIETY. An organization formed with the general purpose of interesting its members in the best plays and in obtaining their support for them. It includes a method of distributing tickets, and, also, reports of the plays made by a committee composed of experts in the drama, representative men and women in business, social activities, and the arts allied to drama. This committee attends "first nights," and reaches its decisions by a majority vote. When a play is placed on the society's list, a bulletin reporting the fact is sent out to members. Members pay a subscription price for which they receive a certain number of tickets. The society resulted from a movement begun about ten years ago in the People's Institute, New York City. Charles Sprague Smith, then president of the institute, organized a drama committee and made arrangements with the managers by which plays which it recommended should be open to workmen, school children, and school teachers, at half price. In this movement they were very successful. The society has been well supported, and the results achieved have been on the whole most satisfactory. The president is Mrs. E. R. Hewitt; secretary, John Corbin; treasurer, Thomas W. Lamont.

DRAPER, ANDREW SLOAN. An American educator and public official, died April 27, 1913. He was born in Westford, N. Y., in 1848. When he was seven years of age, his parents removed to Albany, where he was educated in the public schools, at the Albany Boys' Academy, and the Albany Law School. From the latter institution he graduated with the degree of LL.B. in 1871. For five years he practiced law as a member of the firm of Draper & Chester in

Albany. In 1881 he served a term in the House of the Assembly. He was elected State superintendent of public instruction at Cleveland, O. In that city he remained for two years, reorganizing the school system. This position in turn he resigned in 1894 to become president of the University of Illinois. During his administration the institution erected a dozen buildings and advanced from 750 to 3900 students. When the two State educational departments in New York were united in 1904, a special provision was inserted in the law to make Dr. Draper eligible, and he was made commissioner of education. His term expired on March 31, 1910, and he was reappointed by the regents of the university for an indefinite term. Dr. Draper's achievements during his term of office include the inception and completion of the State educational building at Albany, costing \$4,000,000; the enactment of rural schools supervision law; the reorganization of the normal schools; the organization of the State examination board; the advancement of professional education through a stricter administration of the law; and the enactment of a State scholarship law. From 1902 he was a member of the United States Indian commissioners, and was for several years its chairman. He edited several volumes of reference works, and in 1900 was awarded a silver medal at the Paris exposition for a monograph on the organization and administration of the American school system. He was also awarded medals at the St. Louis exposition. He was the author of *The Rescue of Cuba*, and *American Education*. He also published numerous addresses.

DUHRING, LOUIS ADOLPHUS. An American dermatologist, died May 8, 1913. He was born in Philadelphia in 1845, and graduated from the medical department of the University of Pennsylvania in 1867. After serving for a time as resident physician in the Philadelphia Hospital, he studied dermatology in the hospitals of Paris, London, and Vienna, and in 1870 he opened a dispensary for skin diseases in Philadelphia, of which, until 1880, he was physician. From 1871-76 he was clinical lecturer at the University of Pennsylvania, and from 1876 until his death was professor of diseases of the skin at that university. Among his writings are: *Atlas of Skin Diseases* (1876), *Practical Treatise of the Skin* (1877), *Cutaneous Medicine* (1898), and numerous other works on dermatology.

DUNKERS. See **BRETHREN, CHURCH OF THE**.

DUTCH EAST INDIES. Certain colonial possessions of the Netherlands lying between Australia and the Asiatic continent, and consisting of Java (16 residencies), Madoera (1 residency), and the outposts (17 provinces). Capital, Batavia.

AREA AND POPULATION. The area and popu-

lation (end of 1905) of Java, Madoera, and the outpost provinces (approximate) appear in the following table:

	Sq. m.	Pop.
Java	48,686	28,604,719
Madoera	2,090	1,493,289
Outposts		
Island of Sumatra:		
Sumatra, West Coast.....	31,788
Padang Highlands.....	403,431
Padang Lowlands.....	905,040
Tapanoell	413,301
Benkoelen	9,437	204,269
Lampung Districts.....	11,338	156,618
Palembang	53,718	796,352
Sumatra, East Coast.....	35,481	568,417
Atjeh	20,650	582,175
Riouw *	16,379	112,216
Banka	4,473	115,189
Billiton	1,869	36,858
Borneo, West District.....	56,061	450,929
Borneo, South & East Dists.....	157,587	782,726
Island of Celebes:†		
Celebes	49,600	415,499
Menado	22,177	436,406
Amboina †	19,870	299,004
Ternate †	176,698	370,902
Timor	17,782	308,600
Ball and Lombok.....	4,063	523,635
Total.....	739,559	37,979,377

* Consists of Indragiri in Sumatra and the Riouw and Lingga archipelagoes. † Included in Ternate are a part of eastern Celebes Island, Dutch New Guinea, and a part of the Moluccas; the rest of the Moluccas are in Amboina. Dutch New Guinea extends to 141° E., with estimated area, 152,428 square miles, and estimated population, 262,000.

Exclusive of New Guinea the native population numbered 37,020,460, of whom 29,715,908 were in Java and Madoera; Europeans, 80,910; Chinese, 563,449; Arabs, 29,588; other Orientals, 22,970. Batavia, the capital, had 138,551 inhabitants; Sourabaya, 150,198; Sourakarta, 118,378; Semarang, 96,600; Pehalongan, 41,719; Djokjakarta, 79,567; Padang, 91,440; Bandjermassin, 16,708; Macassar, 26,145.

PRODUCTION. Official returns of areas under main crops in 1910 give 3,274,264 bahoes under rice (1 baho=1¼ acres), with 84,286,647 piculs production; 213,856 under sugar-cane, 20,459,495 piculs sugar; tobacco, 213,532 ba.; indigo, 17,940; under other crops, 3,213,941. In Java the government coffee plantations covered 72,192 bahoes, producing 32,067 piculs; production from emphyteutic plantations, 172,336 piculs, and from private estates, 13,818; total native culture (Dutch East Indies), 79,014. The tobacco produced on government lands was 830,568 kilos; on emphyteutic plantations, 8,064,555; on private estates, 436,400. From Java came 15,055,083 kilos of tea, 289,527 of indigo (1906), 1,180,849 of cacao (1910).

The government mines at Banka yielded (1910-11), 270,170 piculs of tin; private mines at Billiton and Riouw, 73,110 piculs. The output of coal in 1910 was 542,947 metric tons; of petroleum, 1,491,382 tons. Other mining products are gold, silver, diamonds, copper, and manganese.

COMMERCE AND COMMUNICATIONS. In the following table will be found trade figures for merchandise, specie, and total imports and exports, government and private trade, values in thousands of florins:

	Imports			Exports		
	Mdse.	Sp.	Total	Mdse.	Sp.	Total
J. & M.	219,493	14,250	233,743	259,010	433	259,453
Outposts	95,839	3,058	98,897	163,075	609	163,684
Total private.	315,332	17,308	332,640	422,085	1,052	423,137
Total gov't.	10,014	2,640	12,654	29,461	29,461
Total.	325,346	19,948	345,294	451,546	1,052	452,598

Export of sugar (thousands of florins), 142,682; copra, 42,217; tobacco, 37,893; tin, 32,437; petroleum, 21,692; gums, 14,685; coffee, 11,845; tea, 11,503; rubber, 10,032; pepper, 9697; rice, 8490; rattans, 6934; quinine, 5087; nutmegs, 2580. There entered at the ports in the 1910 trade 6486 steamers, of 11,763,000 cubic meters capacity, and 1972 sailing, of 381,000. The merchant marine included 12,669 vessels, of 628,292 cubic meters capacity. Railways (1910): 2230 kilometers in Java, 337 in Sumatra; local lines in Java, 2025 kms., and in Sumatra, 602. There were 1703 post offices and 598 telegraph stations. Telegraph lines (state), 15,176 kms., wires, 22,479.

ARMY. The colonial force, having an effective strength of 36,821 officers and men, of which 12,841 were Europeans, is maintained by voluntary recruiting. The various feudatory chiefs are under obligations to supply auxiliary troops, and a territorial militia of little value is also maintained.

FINANCE AND GOVERNMENT. The revenue in 1909 amounted to 197,237,032 florins, and the expenditure to 201,278,893; 1910 estimate, 220,834,112 and 226,894,203; 1912, 234,075,845 and 267,504,873. Revenue (1912) from tin sales, 26,422,704 florins; opium, 27,957,200; coffee, 1,187,226; quinine, 406,000; customs, 31,793,000; land tax, 22,329,000; salt tax, 14,309,500; railways, 27,033,000; posts and telegraphs, 5,766,400; various, 76,871,815. A governor-general (1913, A. W. F. Idenburg) administers the colony and exercises a limited legislative function. He has a council, partly legislative, partly advisory, of five members, nominated by the queen.

DUTCH GUIANA, or SURINAM. A Netherlands colony on the north coast of South America. Area, between 46,000 and 49,000 square miles; population, exclusive of negroes of the interior, 86,233. Sugar is the main article of production and export; other products are molasses, rum, cacao, coffee, corn, rice, bananas, and gold. The total imports in 1910 were valued at 7,424,698 guilders; exports, 8,345,447. Tonnage entered, 210,998. Estimated revenue (1911), 6,489,000 guilders; expenditure, 7,308,000. The colony is administered by a governor: W. D. H. (Baron) von Asbeck.

DUTCH WEST INDIES. See CUBAÇAO and DUTCH GUIANA.

DYNAMO-ELECTRIC MACHINERY. Inventive genius had practically ceased to produce new types of dynamo-electric machinery, and manufacturers were concentrating their endeavors on the attachment of larger sizes and the minute refinement of the standard types. This was especially true in generating machines. In 1913 the maximum capacity of steam-turbine alternators was advanced from 25,000 kilowatts to 35,000 kilowatts, or 45,000 horse power. The latter machine was built for the Philadelphia Electric Company. This machine is of the hori-

zontal type and operates at 1200 r.p.m. The over-all length is 65 feet and the combined weight of steam and electric elements is 600 tons. The 30,000 kilowatt turbo-units installed by the Interborough Rapid Transit Company in New York involve radical departures from previous types. Each unit consists of two separate 15,000 kilowatt elements, one operated by high pressure steam at 1500 r.p.m., and the other by low pressure steam at 750 r.p.m. The two generators are electrically coupled as a single unit. In the field of direct-current generators sizes have been attained which were recently considered impossible. A notable installation made by the Southern Aluminum Company comprises eleven units of 5200 kilowatts each, which develop 10,000 amperes at 520 volts for electrolytic purposes. Several types of alternating-current motors which have been known for several years have emerged into the field of practical utility. Among these are the polyphase series motor and the adjustable speed polyphase induction motor. The series motors have proven exceptionally well fitted for crane and hoisting work, a field in which alternating current motors have previously been at a serious disadvantage. Developments in transformer construction include the successful introduction of large units operated at 150,000 volts and units of 100,000 volts for outdoor operation.

DYSENTERY. See EMETINE HYDROCHLORATE.

EARTHQUAKES. The record for 1913 showed very few violent shocks, thus marking a continuance of the relatively quiescent conditions which were noted for the preceding two or three years. An interval of seismic repose more or less prolonged would naturally be in order after the series of world-shaking disturbances which occurred in the period from 1906 to 1910. According to the generally accepted view such earthquakes are the result of tectonic strains that accumulate gradually in the strata of the outer crustal zone or lithosphere and that find relief by intermittent movements when the strains are able to overcome the frictional resistance and inertia of the rock masses. The year, however, was not entirely devoid of incident. A rather heavy shock was felt on November 7 in the district around Abancay, Peru, 250 miles southeast of Lima. It was reported in the press as having destroyed several villages and involved the loss of 250 lives. A series of minor tremors were felt during the latter part of the year in Panama; the strongest was on October 1, and caused some damage at Los Santos, about 100 miles distant from the canal. It was followed by others on succeeding days, and again on November 17 further shocks were reported. Though of minor importance in themselves, they were the source of some apprehension in this country on account of their proximity to the canal, and brought up the question of whether heavier quakes might not take place which would inflict serious if not irreparable damage to the great dam and lock structures. There is no doubt that a shock of the first magnitude centred in the vicinity of the canal, that is, within a distance say of 100 miles, would entail serious effects upon the masonry, as has been demonstrated by the results wrought by the San Francisco, Messina, and other recent examples upon massive stonework. The solid inflexible structures of stone and cement are the

ones that suffer most; steel and wood possess a certain accommodating flexibility to the wave-like movements that usually saves them from ruin. The possible danger to the canal from earthquakes was discussed by D. F. MacDonald, who as geologist to the Isthmian Canal commission has been in a position to acquire an intimate acquaintance with the matter. As a result of his studies he concludes that the waterway itself lies without the zone of violent earthquakes such as might cause serious damage to the locks or delicate mechanism of the canal. The geological structure of the Isthmus is devoid of features like recent mountain uplifts and fault-movements that mark lines of crustal adjustment on a large scale. Furthermore, the seismographic station at Ancon, established some time since, has registered no heavy disturbance of local origin, and the historical records for the last three centuries contain mention of only two such shocks in that time. An earthquake in 1831 destroyed many buildings in Panama. Another in 1882 damaged buildings and bridges and in places threw the railroad track out of alignment. Neither is considered to have been sufficiently forceful to work any considerable damage upon the canal structures.

EAST, SIR ALFRED. An American artist, died September 28, 1913. He was born in Kettering, England, in 1849. After his education at the Government School of Art at Glasgow and at the École des Beaux Arts in Paris, he became one of the best-known of English artists, and his works are to be found in many galleries all over the world. Among the most notable paintings are "Returning from Church," in the Carnegie art gallery; "A Passing Storm," in the Luxembourg, Paris; "A Haunt of Ancient Peace," in the National Gallery of Hungary; "London at Night," in the Milan National Gallery; "The Morning Moon," in the Art Institute at Chicago; and "The White Carnival," in the Brussels National Gallery. There are also numerous works in various municipal galleries in England. In 1906 Sir Alfred published a book on *The Art of Landscape Painting in Oil Color*. He made many visits to the United States, the last of which was in 1912, when he came for the purpose of attending the commencement of Yale University. He was an associate of the Royal Academy and was president of the Royal Society of British Artists. He was created a baronet in 1910.

EAST AFRICA PROTECTORATE. A British dependency between the Umba and the Juba rivers, extending from German East Africa to Italian Somaliland and Abyssinia, and inland to Uganda. It includes seven provinces and a semi-organized northwestern tract, with certain coastal territories leased from the sultan of Zanzibar, and covers an area estimated at 200,000 square miles, with an estimated population of 4,000,000 (administrative districts only, in 1910, 2,295,336). Largest town and chief port, Mombasa (about 30,000 inhabitants); capital, Nairobi (14,000). Kilindini has a fine harbor and is a trade centre. The coastal tribes are largely Mohammedan converts; the inland Bantus, Somalis, Gallas, etc., are pagans. The agricultural area was distributed in 1911 as follows: 4941 acres freehold, 603,811 lease. Of the total (608,752 acres), 601,382 acres were devoted to grazing. This

is a notable departure from conditions obtaining in 1910, when 369,746 acres were grazed (cattle, sheep, and ostriches), and 19,852 were under crops. Imports in 1911-12, £1,330,437 (£1,000,346, including £66,382 for railway supplies, in 1910-11); exports, £1,016,898 (£962,911 in 1910-11); customs, £101,088 (£78,123); tonnage entered, 1,563,650 (1,364,740). Cotton was imported to the value of £394,715; grain, £100,903; provisions £76,878; railway, road, etc., materials, £66,382; sugar, £42,571. Grain export, £108,568; hides and skins, £73,250; copra, £28,055; rubber, £16,498; ivory, £15,649. Principal countries of origin and destination follow:

	Imps.	Exps.		Imps.	Exps.
U. K.	£549,470	£409,810	Neth'ds	£83,817	£10,169*
Br. cols.	272,740	104,740	Aus.-Hun.	29,270	14,237
U. S.	131,718	91,521	France	17,296	145,416
Germ'y	127,722	148,467	Other	118,409	92,538

* To Belgium.

The protectorate operates the Uganda (Mombasa-Victoria) Railway, whose length is 586 miles; cost of construction to March 31, 1912, £5,734,335. The Magada branch of the so-called Uganda Railway was under construction during 1913 and also the link from Port Bell to Kampala, in Uganda. Revenue, 1911-12, £729,078 (£609,585 in 1910-11); expenditure, £772,354 (£682,041); grant in aid, £115,000 (£130,000). A loan of £250,000 was advanced by the treasury for railway and harbor construction, etc.; in 1912 a further sum of £375,000 was loaned, and the grant-in-aid was suspended. Governor in 1913 (appointed in 1912), H. C. Belfield.

EATON, JOSEPH GILES. An admiral of the United States navy, retired, died March 8, 1913. He was born in Greenville, Ala., in 1847, and graduated from the United States Naval Academy in 1867, although he was appointed midshipman in 1863 and ensign in 1869. He served throughout the Civil War and at its close entered the naval academy, from which he graduated as noted above, in 1867. He served on various vessels, rising to the rank of lieutenant in 1871, lieutenant-commander in 1888, commander in 1896, and captain in 1901. During the Spanish-American War he commanded the hospital ship *Solace* and the U. S. S. *Resolute*. He had charge of the landing expedition at Hicacal Point in Guantanamo Bay on June 24, 1898. For gallantry under fire on this occasion he received a medal for bravery. He also took part in the bombardment of Manzanillo, on August 11, 1898. At the close of the Spanish-American War he was assigned to the Charlestown Navy Yard. He was retired with the rank of rear-admiral in 1905. The circumstances surrounding Admiral Eaton's death resulted in the arrest of his wife on the charge of having poisoned him.

ECONOMICS, SOCIAL. See **SOCIAL ECONOMICS.**

ECUADOR. An equatorial republic of South America, on the Pacific coast. The capital is Quito.

AREA AND POPULATION. The eastern limits of

the country, bounded by Colombia and Peru, are not definitely settled, but the generally-accepted area is about 299,600 square kilometers (115,676 square miles); including the Galápagos Islands, 307,243 square kilometers (118,627 square miles). The population is estimated at 1,500,000, though probably this figure is somewhat too large. The proportion of white inhabitants is small, the majority of the people being Indians and the mixed bloods numbering perhaps 400,000. Estimated population of the larger towns: Guayaquil, 80,000; Quito, 70,000; Cuenca, 40,000; Riobamba, 18,000.

EDUCATION. Illiteracy is common. The presidential message of August 10, 1913, stated the number of public primary schools at 1266, with an enrollment of 65,531. On these schools in 1912 the government expended 1,223,090 sucres. The government also supports 12 institutes for secondary education; they had in 1912 a total average attendance of only 1228. According to the presidential message of August 10, 1912, the total number of public, municipal, and private schools was 1590, with 2326 teachers and an enrollment of 98,413. Some opportunity for higher education is afforded by universities at Quito, Guayaquil, and Quena and a law school at Loja. These institutions have over 600 students. The state religion is Roman Catholicism.

INDUSTRIES AND COMMERCE. Ecuador possesses valuable mineral resources, but they have not been exploited to any great extent. Aside from the Panama hat, manufactures have little commercial importance. Agriculture is the chief source of wealth, and cacao the leading crop. For this commodity Ecuador supplies a large part of the world's demand, though the proportion is smaller than formerly; the average Ecuadorean supply has not declined, but the output of other countries, notably Brazil, has in recent years greatly increased. Other products are coffee, rice, sugar-cane, tobacco, vegetable ivory, and rubber.

Imports and exports have been valued as follows, in thousands of sucres:

	1907	1908	1909	1910	1911	1912
Imports..	19,670	20,555	18,704	16,048	16,477	23,240
Exports..	22,907	26,559	24,879	27,323	28,062	26,116

The leading imports are cotton textiles, food-stuffs, hardware, and machinery. Principal exports in 1911, in thousands of sucres: Cacao, 21,057; vegetable ivory, 4768; Panama hats, 2584; rubber, 2066; coffee, 1536; gold, 1210; hides, 528. Trade by principal countries, in thousands of sucres:

	Imports		Exports	
	1911	1912	1911	1912
United States.....	4,629	5,325	8,399	6,555
United Kingdom....	5,124	5,853	2,343	2,048
Germany	3,232	4,900	4,616	4,396
France	1,081	1,470	9,844	7,321
Belgium	1,100	366
Italy	1,032	309
British colonies....	1,641
Other	2,412	1,939	2,900	5,121
Total.....	16,477	23,240	28,062	26,116

COMMUNICATIONS. Transportation facilities, both railways and wagon roads, are very inadequate. In 1912 about 370 miles of railway

were reported in operation; of this mileage, 297 miles are comprised in the Guayaquil-Quito line. In July, 1909, construction was begun on a line from Bahía de Caraquez to Quito; about 50 miles were in operation in 1913, opening up an important cacao district. In July, 1910, a line from Manta to Santa Ana was begun; this was formally opened to traffic as far as Portoviejo, the capital of Manabí province, May 4, 1913. This line facilitates the exploitation of valuable timbers, gold-bearing fluvial sands, and groves of vegetable ivory. At the end of 1912 there were 5340 kilometers of telegraph lines, with 188 offices. Post offices at the same date, 151; the postal money-order system was introduced in the principal post offices in 1912, and the parcel-post service was greatly augmented.

ARMY. During 1912 there was little to be recorded about the army, which is organized on the basis of the law of January 15, 1902, demanding personal and compulsory service between the ages of 18 and 60 years, of which three years are spent with the colors and eleven years in reserve of the active army, twelve years with the national guard, and sixteen in the territorial army. The peace effective strength is stated at 3546 officers, of which 16 are generals, and about 18,000 enlisted men. The war strength is estimated at 100,000 men. The infantry consists of 13 battalions; cavalry, one regiment of seven squadrons; and artillery, three regiments of four batteries. The engineers form one battalion. The reserve battalions are maintained and organized for all branches of the service.

FINANCE. The standard of value is gold. The monetary unit is the sucre, par value 48.665 cents (one-tenth of a British sovereign). Revenue and expenditure in 1912 balanced at 19,972,800 sucres. The larger sources of revenue were import duties, 8,155,620 sucres, and export duties, 4,598,408. The larger disbursements: Public debt, 6,927,348 sucres; war and marine, 3,411,810; instruction, 1,844,696; interior and police, 1,561,325; finances, 1,080,069; public works, 1,003,255. Estimated revenue and expenditure for 1914 balance at 20,386,583 sucres. Public debt, 43,300,000 sucres.

NAVY. The navy includes one destroyer, one torpedo boat, three launches, one transport, and an auxiliary vessel.

GOVERNMENT. According to the constitution the president is elected by direct vote for four years. He is assisted by a cabinet of five ministers. The congress consists of the Senate (32 members, elected for four years) and the Chamber of Deputies (48 members, elected for two years). For the term beginning August 31, 1911, Emilio Estrada was inaugurated president in succession to Gen. Eloy Alfaro. Estrada died December 21, 1911, and, in accordance with the constitution, was succeeded by the president of the Senate, Carlos Freile Zaldumbide, as acting president. There quickly followed a revolutionary outbreak, headed apparently by friends of General Alfaro (who was killed) and marked by acts of infamous barbarity. The president of the Chamber of Deputies, Francisco Andrade Marín, succeeded to the position of acting president. On March 31, 1912, Gen. Leonidas Plaza, who was commander of the government forces and who had served as president in 1901-5, was elected president and on the 31st of the following August was inaugurated for a four-year

term. The provinces are administered by governors appointed by the president.

HISTORY. Congress convened in regular session at Quito on August 10, and elected Sr. Alfredo Baquerizo Moreno president of the Senate, and Sr. Manuel Escudero speaker of the House. President Plaza's message to Congress commented on the generally satisfactory state of foreign relations. So far as the proposals to submit the disputes with Peru to arbitration were concerned, President Plaza declared that arbitration would be prejudicial to the national honor of his country; nevertheless he offered with somewhat questionable magnanimity to treat directly with the Peruvian government, and expressed the hope that "Peru would not reject the occasion which is now offered to bring to a solution this irritating question." The refusal of arbitration was probably motivated by a confident expectation of support from Chile in annoying Peru.

As in Costa Rica and in Colombia, the Pearson interests were negotiating in Ecuador for permission to exploit the petroleum resources. The concession which it was proposed to grant would have required the *concessionaires* to spend only \$500,000 within the next ten years in return for very extensive privileges. The project was adversely criticised by *El Guante*, an influential journal of Guayaquil, and failed to receive the sanction of Congress. Contracts were authorized, however, for the sanitation of Guayaquil, "the sore spot" of the coast, and for railways from Quito to the province of Esmeraldas, from Huigra to Cuenca, and from Guayaquil to the coast. There was also a bill before Congress for the appropriation of \$150,000 to construct a wireless system. An executive decree increased by 50 per cent. the excise taxes on foreign and domestic liquors.

A recrudescence of the revolutionary disorders of last year was threatened in the autumn when Col. Carlos Concha, irritated by the liberal tendencies of President Plaza, and anxious for power himself, set up the standard of revolt near the Esmeraldas River. The rebels were defeated in November, however, by government troops under Col. Valesco, and the rebel stronghold at Riobamba was captured. On December 15 Col. Concha and his associate, Gen. Jorge Martinez, captured the city of Esmeraldas, and subsequently Gen. Juan Navarro, minister of war, took command of an expedition to recapture that town from the rebels. In December the Ecuadorian government entertained at Quito a congress of students of Greater Colombia, attended by delegates from the three republics of Colombia, Venezuela, and Ecuador, which prior to 1830 had formed the single state of Greater Colombia.

EDUCATION. See section so entitled under various foreign countries.

EDUCATION IN GREAT BRITAIN. ELEMENTARY EDUCATION. The year 1913 marks a new era in English education; never has so much interest been shown in educational progress which has not been marred by bickerings on the religious question. This interest has been stimulated in the main by the speeches of Lord Haldane and Mr. Joseph Pease, the president of the board of education, both of whom profess to speak on behalf of the cabinet. It may be said that the question is at last being considered from the standpoint of the highest statesman-

ship. A feeling has at last been engendered that a great world-power can no longer continue in the world-competition with a system of education which is piecemeal and uncoördinated. As early as January 10, 1913, Lord Haldane opened the educational campaign with a speech in Manchester, which he has amplified and developed in numerous other speeches throughout the year. A number of speeches have also been made on different occasions by Mr. Pease, who deliberately defined the policy of the present government in his speech in Parliament on July 22, when introducing a bill to make additional grants to local educational authorities. In his Manchester speech Lord Haldane stated that his colleague in the cabinet recognized that "education was the next and most urgent of the great social problems," and in a speech delivered in March at the annual meeting of the National Union of Teachers at Weston-super-Mare he said, "A national system . . . must take cognizance of all the means by which education is provided in a country like this—the highest means, and lowest means, the university, the secondary school, the elementary school; and they must all be fitted into their place in one system." In the same spirit Mr. Pease in the House of Commons stated that the English national system of education is neither national nor a system, "but that measures were being prepared and a bill was promised to be introduced in 1914 for national and comprehensive reform." Briefly outlined the lines of future progress contemplated by the government are as follows: The local education authorities, which have responded magnificently to the educational demands laid upon them by the act of 1902 and succeeding measures such as the provision of meals and medical treatment, have almost reached the limits of their financial capacity. The point has been reached when the state must shoulder a larger share of the expenditure on education. Increased grants must be made, but the basis of appropriation will be changed with a view to equalizing educational opportunities everywhere, aiding poor districts, and rewarding meritorious effort. All branches of education must be placed under the purview of the national authority. The present range of school age must be extended at both ends. "Healthy motherhood, healthy infancy, and a healthy school life are progressive and indispensable steps to healthy citizenship in later years." Hence the physical side and medical inspection will receive increased attention; mothers will be trained; nursery schools will be provided. The compulsory age for elementary education will be raised universally to 14, and continuation schools, perhaps of a compulsory character, will be provided. The old Cockerton decision will be rescinded and elementary schools be permitted to give more advanced instruction in the last two years of school life. Above all, however, the opportunities for higher education must be increased, more secondary schools must be provided, easily accessible to all children of ability by means of a more extended scholarship scheme. Intermediate education, i.e., that between elementary school and university, must accordingly be made a vital part of the system, so that the educational career becomes a "broad highway" for ability. Further, the national system will require that the central authority take notice of the thousands of private schools and in some

way impose certain educational standards. Lord Haldane also suggested an increased number of municipal or local universities. The scheme does not contemplate, however, a centralized, bureaucratic system, but through increased grants it will encourage local authorities to greater effort and will impose a national minimum. The religious question, it is hoped, will settle itself or, as Lord Haldane expressed it, the religious difficulty "we will take in our stride." In the meantime the bill introduced by Mr. Pease on the occasion of his speech for a grant in aid of loan charges and increased appropriation for medical inspection failed to become law.

EVENING SCHOOLS. There has been a complete reorganization of evening school systems of the London County Council. After a survey of the existing system published in a *Report of Eight Years of Technical Education and Continuation Schools*, it was felt that some remedy was required to improve the attendance, to link up the evening schools with higher institutions, and make the continuation schools more attractive to boys and girls leaving the elementary schools. The new evening schools, to be known as "institutes," will be more specialized and more coördinated, and will pay more attention to the humanities and the development of social life and activities. Advisory committees of employers will be appointed for each school. Only full or half time teachers will be appointed. The schools contemplated at present (250 in number) are: Junior and advanced commercial institutes to lead up to the London School of Economics and the City of London College; junior technical institutes leading up to the polytechnics, technical schools, and school of art; women's institutes providing domestic science and general courses; general institutes; non-vocational institutes for students over 18; institutes for the deaf; and special institutes for foreigners, policemen, railway and civil service employees. There will be standing conferences of heads of departments and responsible teachers or principals in junior and advanced institutes, there will be interchange of advice and consultation syllabuses. The new scheme thus includes the following considerations: (1) occupation of students; (2) existing institutions; (3) courses of instruction; (4) age of students; and (5) non-vocational subjects. Fees will be charged from which pupils who join immediately on leaving school will be exempted.

STATISTICS OF ELEMENTARY AND SECONDARY SCHOOLS. In 1911-12 there were in England and Wales 20,900 elementary schools with accommodations for 6,862,876 pupils, with 5,582,238 pupils on the school registers, and an average attendance of 4,962,797. There were employed 163,683 teachers (41,307 men, and 122,376 women). The total expenditure on public elementary schools by the Board of Education out of the parliamentary vote was £11,775,390 (\$58,876,950). The number of secondary schools on the Board of Education's grant list was 995 with a total of 165,617 pupils (89,004 boys, 77,613 girls), and employing 10,080 teachers (5106 men, 4974 women); on the efficient list there were in addition 102 schools with 18,975 pupils (10,924 boys and 8051 girls); the number of teachers employed in these schools is not given. There are in addition numerous second-

dary schools which do not come under the control of the Board and for which there are no reliable statistics. The total expenditure on secondary schools by the Board of Education was £758,525 (\$3,792,625).

TEACHERS' REGISTER. The teachers' register is at least likely to become a *fait accompli*. In accordance with the provisions of the order in council of February 29, 1912, and of the education (administrative provisions) act, 1907, the Teachers' Registration Council, an independent and not a state body, has issued the conditions for admission to the register. The names of all teachers in every type of school will be put on the register in alphabetical order and their attainments, training, and experience will be given. To qualify for admission teachers must be 25 years of age, must pay a fee of one guinea, give evidence of having taken a course of training of at least one year in principles and methods and practice teaching under supervision; other additional qualifications are a university degree, the board of education certificate for elementary school teachers, a diploma of a university or technical institution, the certificate of an examining body, or other evidence of attainments in certain subjects for which a degree is not given. Until 1918 teachers with five years' teaching experience will be accepted. Registration is, of course, not compulsory, but in all probability employing authorities will ultimately regard it as a qualification for appointment. For the teaching profession the register means unity, solidarity, and absence of distinction or classification, a feature welcomed in particular by the elementary section.

EDUCATION IN THE UNITED STATES.

ATTENDANCE IN ELEMENTARY SCHOOLS. The report of the commissioner of education states that 18,521,022 pupils attended the elementary schools during the school year 1910-11. Of these 1,470,581 were in private schools. It is estimated that these children are distributed among the eight grades as follows:

Grades	Per cent.	Grades	Per cent.
First	24.9	Fifth	11.9
Second	14.9	Sixth	8.2
Third	14.5	Seventh	6.3
Fourth	14.0	Eighth	5.3

ATTENDANCE IN HIGH SCHOOLS. During the school year 1911-12 there were 1,105,360 students in public and 141,467 students in private high schools. These were distributed among the four years of the high school as follows:

Year	Percentage	
	Public schools	Private schools
First	41.73	34.85
Second	27.08	26.84
Third	18.21	20.90
Fourth	12.98	17.41

COST OF STATE COMMON SCHOOLS. The total cost of public elementary and high schools for the school year 1910-11 was \$446,726,929. This was an amount equal to \$4.76 for each inhabitant of the country. Nearly sixty per cent. of the expenditures is for teachers' salaries. This amount represents an average annual salary of \$446.40 per teacher. There were permanent school funds amounting to \$252,172,335 that yielded 3.3 per cent. of the

school revenue, while 74 per cent. was raised by local and 15.3 per cent. by State taxes. The estimated value of the property used for school purposes was \$1,221,695,730.

EDUCATIONAL INVESTIGATION AND INQUIRIES. Among the more noteworthy educational investigations of 1913 were the following:

a. New York City. The School Inquiry Conducted by the Board of Estimate and Apportionment. Although this inquiry was begun in 1911 with Prof. Paul H. Hanus of Harvard University as director and continued through 1912, the findings were not made public until they appeared in a dozen or more interim and supplementary reports during the early months of 1913. The importance of the city and the high professional standing of those who were employed to conduct the investigation served to make this the most thoroughly discussed recent event in education. The most concise summary of the conclusions reached is found in the following paragraph taken from Professor Hanus's "Conclusions of the report as a whole":

"It is clear that in spite of the progress the public-school system of New York City has made since the consolidation, it is seriously defective. It needs thorough reorganization in respect to its administration by the board of education and the supervisory staff; and in respect to its general system of supervision. The board of education needs a clear conception of its functions, and should come to close quarters with its work. The board of superintendents fulfills no useful function and should be abolished. In the general system of supervision, helpful coöperation under leadership should replace bureaucratic control. The board of examiners is decidedly efficient, but needs reorganization to improve and maintain its efficiency. The courses of study for elementary schools and for high schools needs thorough-going revision, and flexibility should replace rigidity in their administration. The quality of the teaching in the elementary schools, at least, is in general not good, though sometimes good to excellent. The provisions for the discovery, segregation, and appropriate treatment of the mentally defective children are quite inadequate, and need immediate attention. The compulsory attendance service is inefficient; it emphasizes police functions rather than preventive measures, and the staff needs reorganization on a functional basis. The recognized advantages of intermediate schools in relieving congestion have not led to the further establishment of such schools, and no attempt has been made to realize the exceptional educational opportunities these schools afford; promotions and non-promotions are not studied so as to yield a real basis for a maximum rate of promotion; part time should be abolished; the estimated need of teachers for elementary schools and for high schools is not based on indisputable and well-organized data. The provision for industrial education is so meagre as to be almost negligible; neither industrial nor commercial education is so maintained as to secure the necessary effective coöperation of industry and commerce, and coöperative and continuation schools are wholly absent. Habitual self-scrutiny and an appeal to well-conducted investigations and experiments to secure the necessary data to confirm or refute educational

opinion and furnish the regulative for all the activities of the school system and for its adequate financial support are lacking."

b. Ohio School Inquiry. The 1913 General Assembly of Ohio provided for a commission of three persons to make an inquiry into school conditions in Ohio as found in the rural schools, the normal schools, and the town and city schools. Ten thousand dollars was appropriated to pay the expenses of the investigation. Dr. Horace L. Brittain of the New York Bureau of Municipal Research was made the director of the investigation. The attempt has been made to have this a coöperative effort by having a large part of the field work done by those in the State whose interest led them to volunteer to visit schools. Three hundred and forty-one one-room schools were thus inspected.

Not all of the recommendations of this commission have been published, but such as have emphasize the need of a more adequate system of keeping school records and reporting to the State superintendent. They provide for the reduction of the types of teacher's certificates from fifty-eight to thirty-two, and the actual testing of the candidate's teaching ability as a part of every examination for a certificate. They urge supervision for all the schools of the State. They provide for a deputy State superintendent of public instruction and for a bureau of efficiency in the office of the State superintendent.

c. Portland, Ore. Survey of the Public School System of District No. 1, Multnomah County, Ore. At a taxpayers' meeting held in Portland on December 27, 1912, the following resolutions were adopted:

"Whereas, the average daily attendance at the public schools of this district has increased from 10,387 in 1902, to 23,712 in 1912, and the annual disbursements have increased during the same period from \$420,879.61 to \$2,490,477.28; and

"Whereas, it is of the utmost importance that the public schools should be kept at the highest point of efficiency, it is hereby declared to be the sense of this meeting that a full and complete survey be made of the public school system of this district, comprising:

1. The location, type, character, and condition of existing school houses, and the estimated cost and type of future buildings;
2. Of the organization and methods of administration;
3. Of the form and manner of instruction;
4. The courses of study and the quality of the text-books;
5. The extent and need of playgrounds and gymnasiums;
6. The development of domestic science, manual training, trade, agricultural and horticultural schools.
7. The salaries of teachers and other employes.
8. The method and system of accounting.
9. The form of organization, and the examination of the school laws of the State, as applied to this district.
10. Of the average cost per pupil in comparison with other cities and
11. Of the scientific method of raising the required revenue, either by direct taxation or the issuance of bonds, or both."

A committee of five was appointed with authority "to make a full and complete survey of

every phase of the public school system of this district, said committee to serve without pay, but they are authorized and empowered to employ such expert investigators as may in their judgment seem necessary." Seven thousand five hundred dollars was appropriated for the expense of the survey. Dr. Ellwood P. Cubberly, professor of education, Leland Stanford Jr. University, was secured as director of the survey, and he employed several assistants.

The report, which was submitted to the commission November 1, 1913, while praising some features of the school system, criticises many others, and suggests the remedies. In particular it states that many of the school buildings are located on noisy, dusty streets, that some of them are too high, and others not fireproof. It estimates that the city requires annually sixty new class rooms to accommodate the increasing number of pupils, and that the cost of these rooms in fireproof construction will be \$420,000. It criticises the board of directors on the ground that it "tries to manage too much and too many details." The instruction in the first three grades is pronounced good, while elsewhere it is good in some rooms. Much of the poor teaching in the elementary school is traced to the curriculum, which is characterized as "vivisected into fifty-four dead parts." The need of additional playgrounds, gymnasiums, open-air schools, medical inspection, and other health provisions is urged. In addition to increasing the offering in manual training and domestic science, the report recommends that an agricultural high school be organized and located on a site of not less than fifty acres; that intermediate schools be provided; that ungraded classes be established in connection with each elementary school; and that there be four or five special or truant schools, two special art schools, two or more neighborhood schools and a school for the instruction of school janitors. It also recommends that the vacation and night school systems to be enlarged, extended, and changed somewhat in type, and that the school day be lengthened and Saturday forenoon included for vocational work in the grammar grades and above. The salaries of the Portland teachers compare favorably with those paid elsewhere in the West, but they are not based on merit or efficiency. "The costs of elementary education in Portland are about what other Western cities average, while the costs of secondary education are lower."

d. Vermont Educational Inquiry. An educational commission was constituted by an act of the Vermont legislature, approved November 19, 1912. The following quotation from the act defines the duties of the commission:

"Whereas, a doubt has arisen in the minds of many of those most intimately related to the secondary and elementary schools of the State as to the efficiency of our common school system, and

"Whereas, a similar doubt prevails among many friends of higher education regarding the adequacy of the return which the State is getting from its appropriations in aid thereof, and

"Whereas, his excellency, the governor, has recommended in a recent message the appointment of a commission to investigate and report on these matters:

"Therefore, it is hereby

"Resolved by the Senate and the House of

Representatives, that a commission of nine persons, at least two of whom shall be experts in or engaged in educational work, shall be appointed by the governor to inquire into the entire educational system and condition of the State. This commission shall report at the earliest possible date on the several rights, duties, and obligations of the University of Vermont and the State Agricultural College, Middlebury College, and Norwich University, with such recommendations as will prevent unnecessary duplication and consequent financial waste.

"Resolved, That as soon as practicable after reporting on the institutions of higher learning hereinbefore referred to, the said commission shall recommend, by bill or otherwise, such reorganization of our public elementary and secondary schools, in adjustment to the entire educational system of the State, as will promote the ends of unity, harmony, economy, and efficiency."

The members of the commission were to serve without pay except for their necessary expenses. On February 24, 1913, the commission invited the Carnegie Foundation for the Advancement of Teaching to undertake the necessary investigation and they accepted.

The commission has reported the following recommendations:

"1. The recognition by the State of the reorganization of elementary and secondary education, including vocational training, as its immediate and supreme duty.

"2. The organization of the office of a commissioner of education upon a basis competent to furnish expert supervision for the public school system. This involves a small lay board serving without salary, and salaries for educational experts of a character to secure the ablest men and women.

"3. The problem of the revision of the course of study, the establishment of agencies for training teachers, and other administrative details to be worked out by this board and its experts.

"4. The State Agricultural College to receive a larger proportion of the generous annual appropriation of the State from the Federal government and to be developed along lines calculated to make fruitful connection between the Agricultural College and the industries of farming, dairying, gardening, stock- and poultry-raising, and fruit culture.

"5. That subsidies to higher education cease, the colleges being given a reasonable time in which to rearrange their budgets."

MEASUREMENT OF RESULTS IN EDUCATION. Among the results that have come from the severe criticisms that the public education has received is a fuller appreciation of the need of definite standards for the measurement of the efficiency of the schools. Until recently there was almost unanimous belief that education was concerned with such subtle processes that it was impossible to measure the results. The criticisms have implied the possibility of measuring the quality of achievement, while the necessity of changing school procedure is forcing school officers to search for definite standards.

The National Council of Education at its meeting in Philadelphia in February, 1913, devoted a large proportion of the time to the consideration of standards. Its committee pre-

sented a report on "Standards and Tests for Measuring the Efficiency of Schools and Systems of Schools." The report which has been published as *Bulletin, 1913, No. 13*, by the United States Bureau of Education summarizes the work that has been done in the way of standardizing school subjects and features of organization, and ends with a recommendation that a committee be appointed with the following functions:

"1. It should offer encouragement, expert advice, and opportunity for publication to those engaged in scientific work in the direction of the derivation of scales of measurement, in the application of scales or units to actual school situations, or in the establishment in any other manner of standards in relation to public education.

"2. It should offer expert advice with respect to the nature and scope of surveys, investigations, or inquiries to be undertaken in any part of the United States.

"3. It should offer to members of our profession engaged in administrative work the opportunity to secure a scientific investigation of their systems of schools under the direction of professional experts. As the situation is at present, we have the anomaly which permits a politician, an interested book-publishing firm, or a personal enemy of the chief administrative officer of a school system to attempt to secure the removal of such an officer without any adequate measure of the efficiency of the school system or the accomplishment of the man whose work is called in question. The establishment of a body of professional experts would in time render such action impossible."

The recommendations of the committee were accepted by the council and a committee of fifteen members was appointed.

MONTESSORI METHOD. The Montessori method of teaching exerted increased influence during 1913. A group of prominent educators and others formed the Montessori Educational Association with headquarters in Washington. Mrs. Alexander Graham Bell is its president and Miss Anne E. George its educational director. During the spring months Dr. Montessori conducted a teachers' institute in Rome. Among her students were sixty Americans. In December she made a brief visit to this country and delivered lectures in a few of the larger cities, being everywhere received with great enthusiasm.

PUBLIC SCHOOL ADMINISTRATION. The increasing importance of State education departments has been emphasized during the year. The most significant single event was the election of Dr. John H. Finley, president of the College of the City of New York, to the position of commissioner of education for the State of New York, a position that up to the time of his death, April 27, 1913, Dr. Andrew S. Draper had held. It is noteworthy that in each instance the regents have been able to secure as commissioner the president of an important institution of higher learning, for Dr. Draper resigned the presidency of the University of Illinois to become the commissioner when the position was created in 1904.

Maine and Iowa each increased the salaries of the State superintendent to \$4000. Several States, notably Idaho and North Dakota, have enlarged the authority of the departments of

education, while the Vermont educational commission recommends a large increase in the responsibilities and salary of the State superintendent.

In the field of city school administration, events in the two largest cities in the country have focused attention upon the question of the proper relationship between the superintendent and the board of education. Early in the year the legislature of New York passed amendments to the charter of New York City that gave to the board of education authority and initiative that had belonged to the board of superintendents. One amendment authorized the board of education "to change the grades of all schools" and to "adopt and modify courses of study for all schools." The second amendment gave them authority to appoint three additional district superintendents without receiving recommendations from the board of superintendents. The third amendment provided that "the president of the board shall have power to designate any member of the supervising or teaching staff to inspect and report upon any subject of which the board has cognizance or over which it has legal control." When the amendments came before the governor, they were so bitterly opposed by many educational authorities that he vetoed all but the first, and this also received the approval of the mayor of New York.

The superintendent of the Chicago schools, Mrs. Ella Flagg Young, resigned "for the purpose of maintaining harmony in the administration of the Chicago schools." Various statements of the conditions that led to this act make it evident that the superintendent considered that some members of the board of education were dealing with matters that were outside their proper sphere. The board by a vote of 14 to 1 declined to accept her resignation and Mrs. Young withdrew it and resumed her duties. In December Mrs. Young was a candidate for reelection, but she was defeated and her successor was elected. This action created such a storm of protests, particularly on the part of the women of the city, that the mayor removed several members of the board and the new body reinstated Mrs. Young.

The question of what constitutes the proper functions of the superintendents and of the city boards of education is still in controversy. The opposing views are very clearly stated in the following quotations, the first of which is taken from the report of the survey of the public school system of Portland, Ore.:

"At the head of the school department is the superintendent of schools. His chief function will be the supervision of instruction, but with final jurisdiction, subject only to the board of school directors, in the case of other matters than instruction. He should be made the real head and leader of the school system in fact, as well as in name, and full responsibility for the successful conduct of all departments of the educational service should be placed squarely on his shoulders. . . .

"To the superintendent of schools should be given final control of the course of study in the schools; the selection of text-books and supplementary books to carry out the course of study; the selection, promotion, and dismissal of teachers; the assignment of teachers and principals to their duties; the making of rules and regulations relating to the conduct of the

schools; and the general control of the educational work of the school system. . . .

"As long as the board has confidence in the judgment and ability of the superintendent he should be supported in his acts; when they cease to have such, they should call for his resignation. They should not assume authority in educational matters themselves, nor permit him to evade his proper responsibility by putting it off onto them."

A very different view is indicated in the following extract from a report to the New York board of education by its president, July 9, 1913:

"When you began your work of the present year there was existent in this building a time-honored tradition that a board of education should not presume to deal first-hand with education itself, but should be confined to matters of finance, equipment, and perfunctory voting upon measures to be perfected by those whom it was a usage to designate as educational experts. Some years of adherence to this theory had built up a system so unsatisfactory as to result in a compulsory investigation of the schools and in published declaration of their formalism, rigidity, and obsolescence. In a review of the investigators' findings, the head of the commission concluded the service of education in this city to be seriously defective and the board of education at not sufficiently close quarters with its work. But several months before the publication of these criticisms, you, from your own experience and from your own desire of progress, had anticipated them by coöperative action in taking up, considering, and passing upon vital questions directly concerned not only with sites, buildings, and supplies, but with the actual training of children.

"In accordance with this policy you have provided for a special committee to represent you in the preliminary steps leading to the nomination of district superintendents. Your high-school committee has performed a similar service affecting the nomination of high-school principals. In both of these changes you have realized that your responsibility to the city is not fulfilled by a perfunctory vote, but that, as you are held ultimately responsible, your judgment should find the freest exercise in important matters of this kind and early enough in the proceedings to escape embarrassment through desire to avoid personal disparagement of candidates nominated without consulting you."

SCHOOL HYGIENE. The most important outcome of the efforts to trace the causes of educational inefficiency is the increased attention that is now given to hygiene. Various investigations have proved that a large proportion of school children do not remain in school any longer than the compulsory attendance laws require, and that even a larger number are retarded by having to repeat work. Not all of the causes of this waste have been determined, but more than four hundred important cities now regard health as such a large factor that they support well-organized departments for the supervision of the children's health. The fourth International Congress of School Hygiene, which was held in Buffalo, August 25-30, 1913, gave an added impetus to the movement in this country. The following brief descriptions of the departments included in school

hygiene serve to convey some notion of the scope of the work undertaken:

a. Medical Inspection. An examination of 121,832 school children of Boston showed that 69,333 had physical defects. This proportion is not different from that found in other places where examinations have been made. The more important duties of the department of medical inspection are: (1) Detection and correction of physical defects; (2) prevention, detection, and exclusion of communicable diseases; (3) sanitary inspection of school buildings.

b. School Nurses. Medical inspection without visiting nurses has not proven effective, because "the best of medical inspection succeeds only in sending the child home." The school nurse, however, is able to follow up the child and see that he receives the proper treatment. She becomes not only an ideal sanitary inspector, but also an advisory influence in the homes. One school nurse is able to look after more than a thousand school children.

c. Oral Hygiene. Examinations have shown that from 70 to 90 per cent. of all children in the public schools have faulty teeth. The regular medical inspectors often examine the children's teeth. A number of the larger cities, however, have dental inspectors, and support free or partially free dental clinics.

d. Open Air Classes. It is estimated that more than one hundred open air classes are now operated in this country. Such classes were first used for tubercular children, but all the tests that have been made seem to indicate that they also benefit healthy children.

e. School Feeding. The claim is made that 10 per cent. of city children suffer from malnutrition. The purpose of school feeding is to relieve chronic underfeeding rather than acute hunger. The American Home Economics Association found that school feeding began in Germany in 1790; France, 1849; Great Britain, 1866; and in the United States in 1895. At least seventy American cities now furnish free or partially free lunches in their regular elementary schools. Lunches are served in all the open air classes.

f. Psychological Clinics. There are no reliable data regarding the proportion of school children who are so exceptional as to require special treatment. Medical inspectors generally deal with this matter, but since 1896 forty psychological clinics for the diagnoses and treatment of the mentally deficient have been established.

g. Sex Hygiene. The most recent subject to be classed with school hygiene is sex education or sex hygiene. This movement has not progressed beyond the stage of propaganda. The plan for teaching the subject proposed by the American Federation for Sex Hygiene is stated briefly as follows: The mothers of children under six years are instructed in the proper care of the child's body, and how to best answer his questions regarding the origin of human life. Between the ages of six and twelve children should receive instruction to protect them from forming injurious sexual habits, and receive truthful and delicate answers to their questions as to the origin of the individual human life. A carefully-planned series of lessons on reproduction in plants and in animals below the mammals forms a part of the course in na-

ture study. Between the ages of twelve and sixteen children are led to the generalization that animal life comes from *the ovum*. Fertilization in mammals is taught in a way that leads up to reproduction in man. The simplest facts in regard to heredity are presented, and there is specific instruction regarding sexual morality. There is also systematic instruction in practical ethics. Those between the ages of sixteen and maturity are given more thorough instruction in heredity, and in the bearing of sexual morality and immorality on future generations, and specific instruction as to the character and the dangers of venereal diseases. In all cases it is proposed to make the lessons form a natural part of the courses in nature study, biology, hygiene, and ethics.

VOCATIONAL EDUCATION. The tendency in vocational education is toward increased conservatism. Many of the State legislatures considered the question of vocational training and two of them—New Jersey and Indiana—authorized complete systems. Several other States, notably North Carolina, Washington, and Nebraska provided for some phases of industrial training.

The means for establishing industrial or trade schools have in several instances come before the school authorities knew how to use them. Some of these officials have traveled from one end of the country to the other in search of suggestions that they might adopt. Others while not failing to inspect what has been accomplished elsewhere, have set about making a very careful investigation of the industrial and social conditions of their cities. The latter has been the policy in New Orleans. This city has at its disposal a very large sum to be used in establishing a trade school. The school officials have delayed the establishment of the school until the newly-formed department of educational research can make a comprehensive survey of the industrial and social needs of the city.

See also section EDUCATION under various States of the United States.

EDUCATION, VOCATIONAL. See EDUCATION IN THE UNITED STATES.

EFFICIENCY, MUNICIPAL. See MUNICIPAL GOVERNMENT.

EGYPT. A semi-independent tributary state of the Ottoman Empire, occupied by British troops and virtually under British control, Capital, Cairo. The area is given as 363,181 sq. miles, exclusive of the Sudan; of this area only 12,013 sq. miles are settled and under cultivation. Total population (1907), 11,189,978; this is exclusive of nomad Bedouins, estimated to number over 97,000. Of this total, 10,366,046 were Egyptians; 735,012 settled Bedouins; 65,162 Nubians; and 221,139 foreigners (Turks, Greeks, Italians, British, etc.). Population of Cairo, 654,476; Alexandria, 332,246; Tintah, 54,437; Port Said, 49,884; Mehalla el Kubra, 47,955; Mansura, 40,279; Damanhur, 38,752; Zagazig, 34,999. In upper Egypt are Assiut, with 39,442 inhabitants, and Medinet el Fayum, 37,320.

EDUCATION. In furtherance of the policy of coöperation between the ministry of education and the provincial councils which has been in process of development during the three years last past, the provincial councils are taking over all elementary and primary schools and

primary normal schools, and turning over to the ministry of education all secondary institutions. The ministry retains the right of inspection of all schools. In 1912 there were under direct control of the ministry of education 208 establishments, with 29,047 pupils, of whom 5921 were girls; under inspection by the ministry, 3996, with 227,588 pupils, of whom 21,555 were girls. Agricultural schools have increased from 28 with 4065 students in 1911 to 32 with 4591 in 1912. Plans are perfecting for further extension. Technical schools (1912), 23 (21 in 1911), with 3177 students (2953). There are commercial, teachers' training, medical, and art schools.

AGRICULTURE. To quote from Lord Kitchen-er's report, dated Cairo, March 22, 1913, "Egypt, as an agricultural country with no industries of importance, depends on the export of one staple product, cotton, for her imports, of manufactures, of fuel, and of a portion of her food-stuffs, as well as for the service of her foreign debt. . . . Equable climatic conditions, a perennial water supply, and the extraordinary fertility of the soil combine to insure regular and abundant crops. . . . It will therefore be readily realized to how great an extent the economic fortunes of the country depend on the price of cotton. It is, in fact, this partial dependence of the purchasing power of Egypt, as represented by her exports, on the fluctuations in price of a single commodity that renders her peculiarly liable to alternations of expansion and depression. We must bear in mind, therefore, that the level of prosperity which the country now has reached reposes, in a very considerable measure, on the maintenance of the price of cotton which has prevailed during the past few years. . . . Owing to the low Nile in 1912, the supply of water during the year was, with very careful distribution, only just sufficient for the summer crops. In some places the cotton may have suffered slightly from want of water, but generally the crop was a good one and the amount, estimated at 7,500,000 kantars, is a satisfactory yield, only equaled by the crop of 1910. . . . Cotton-worm appeared freely in the early part of the season, but the activity of the government . . . and the energetic conduct of the campaign against the pest prevented it from causing any great damage to the crop."

Areas in 1912 (in feddans) under main crops and estimated yield are shown below (L. E., Lower Egypt; U. E., Upper Egypt; S. G., Suez governate):

	L. E.	U. E.	S. G.	Total A.	Yield
Cotton	1,346,236	375,561	18	1,721,815	7,500,000
Wheat	672,008	610,702	225	1,282,935	5,606,426
Barley	162,768	201,216	67	364,051	2,056,888
Rice	211,083	14,928	..	226,011	1,110,571
Corn, etc.	1,170,344	662,403	321	1,833,068	13,361,345
Sugar	2,380	47,622	27	50,029	21,250,000

* Yield in kantars. † Yield in ardebs; the ardeb varies, that of wheat being 150 kilograms, barley 120, unhusked rice 291, corn 140.

The area under cotton shows an increase over 1911 of 10,574 feddans, all in Upper Egypt. The establishment of halakas (cotton markets) throughout the cotton-growing districts has dealt a blow to fraudulent practices on the part of merchants in their traffic with the fellahen. The five-feddian law enacted in 1912 is de-

signed to protect the small cultivator against usury and the loss of his farm and utensils for debt. The cantonal justice law, by establishing local justices in rural communities to settle local disagreements, register acts and deeds, decide claims, rectify boundaries, etc., will protect the poor and ignorant against fraud and forgery.

For several years the number of cattle and buffalo has shown an annual decrease, and Egypt is obliged to import animals for consumption and labor; this importation without proper inspection has led to numerous outbreaks of cattle plague.

IRRIGATION. The last stone of the heightened Assuan dam was laid December 23, 1912, and the reservoir was subsequently filled. On this subject Lord Kitchener says: "The summer demand for water is met in three ways: (1) By the water flowing down the river itself; (2) by the Assuan reservoir; and (3) by the relatively small volume of water stored by the temporary earthen dams annually constructed on the two branches of the Nile near the sea." Total irrigated land under cultivation in 1910, 2,160,000 feddans, of which 246,000 feddans were under rice. "Rice takes double the quantity of water required by cotton per feddan. With the new reservoir, combined with a normal river, the larger quantities of water available will provide for an increase of 14 per cent. of the present cultivated area, equivalent to 335,000 feddans under summer crops. . . . The first two of the delta drainage schemes contemplated by the government . . . are now in hand, and will . . . permit of regular cultivation on 300,000 feddans of waste and partially waste land. . . . We have also to consider the very important question of protecting Egypt from the disastrous effect of abnormally high floods. . . . Any extensive inundation would cause . . . [great] damage and loss of life. To prevent such a catastrophe and to provide at the same time the necessary water for extended areas of cultivation in years of low Nile it is proposed to erect a dam on the White Nile about 40 miles above Khartoum, so that in case of dangerously high floods the White Nile supply may be temporarily cut off and stored for use in Egypt in the following summer."

COMMERCE. The value of imports declined from £E27,227,118 in 1911 to £E25,907,759 in 1912 (£E23,553,000 in 1910). The value of exports increased from £E28,598,991 in 1911 to £E34,574,321 in 1912 (£E28,944,000 in 1910). Imports of flour from Italy and the Balkan States were influenced by the wars in Tripoli and the Balkans, with the result that increased quantities came from India. The United States received large orders for coal as a result of the English coal strike. A decline in textiles and apparel points to diminished purchasing power on the part of the fellaheen. Specie import, 1912, £E11,546,439; export, £E7,476,282.

The high prices prevailing for cotton in 1912 resulted in a larger export of the new crop than in 1911—£E27,529,277 (£E22,988,200 in 1911); the United Kingdom taking £E12,572,150 (£E11,016,250 in 1911). The increased export of raw cotton to Japan amounted to 60 per cent. Export of cotton seed, £E4,086,950 (£E3,039,000 in 1911). The onion export was valued at

£E384,800 (£E313,900 in 1911). In 1912 150,404,000 eggs (£E180,500) were exported—96,765,000 (£E116,250) in 1911; of crude petroleum, 14,400 tons; of phosphates, 52,100 tons.

The United Kingdom contributed imports valued at £E7,990,658 (£E8,557,296 in 1911) and received exports valued at £E16,022,318 (£E13,958,058 in 1911); Turkey, £E2,753,723 imports; France, £E2,411,425 and £E2,707,000; Austria-Hungary, £E1,679,831 and £E1,431,150; Germany, £E1,421,180 and £E3,885,900; British Far Eastern possessions, £E1,314,316 and £E122,704; Italy, £E1,242,729 and £E948,890; Belgium, £E1,102,711 imports; United States, £E403,528 and £E4,120,900; Russia, £E2,056,302 exports; Switzerland, £E1,008,900 exports.

Tobacco. In 1911 the import of leaf tobacco was 7,957,550 kilograms; in 1912, 8,205,659—an increase of 3.1 per cent. The import of Greek tobacco rose from 2,600,000 kilos in 1911 to 3,008,000 in 1912, constituting Greece instead of Turkey the main country of import. The import from Bosnia and the Herzegovina suffered a 50 per cent. decline. From Russia came 1,511,000 kilos (1,027,000 in 1911). Stocks of tobacco in bond, 184,000 bales.

COMMUNICATIONS. The total length of Egyptian state railways January 1, 1913, was 1512 miles. Capital expenditure in 1912, about £E452,000. The year saw the completion of the new bridges at Mansura and Port Said and the opening of a new station at Shellal. The bridge at Assiut and the two under the Zifta-Zagazig line progressed satisfactorily, as did the Alexandria station. The rails of the Zifta-Zagazig line were to be laid by June, 1913; plans for the Menuf-Kafr-el-Zayat line are completed and materials ordered. Passengers carried (1912), 28,776,280; freight, 6,863,147 tons; gross receipts, £E3,913,700; gross expenditure, £E2,276,000. In addition to government lines there are 788 miles of light railways exploited by public companies. The principal railway construction work in Egypt during the year was the line from Bielah to Baltin in the Delta. There were in 1912, 1715 post offices and stations; December 31, 1912, there were 4233 miles of telegraph lines, with 13,620 miles of wire.

At Alexandria, the principal port, 1927 vessels, of 3,479,146 tons, entered in 1912. The traffic through Port Said amounted to about half that through Alexandria, the remainder going *via* Suez.

ARMY. The Egyptian army is formed from selected recruits, as all male inhabitants are liable under the law for service, six years in the army, five years in the police, and four years reserve. The chief command is vested in the sirdar and governor-general of the Sudan, in 1913, as in the previous year, Lieut.-Gen. Sir Reginald Wingate. There were attached to the native army 188 British officers and a strength of about 18,000 was maintained divided as follows: Cavalry, 800; camel corps, 600; artillery, 1250; infantry, 10,000. The bulk of this force was used for garrison duty in the Sudan, and it was proposed to raise an equatorial battalion for service in the extreme southern provinces. In addition, a British army maintained in Egypt a force toward whose support the Egyptian government contributed. This force in 1913 included soldiers of all arms and, with the:

detachments in Cyprus, amounted to 6466 officers and men.

FINANCE. The revenue for 1912 amounted to £E17,515,000 (estimate, £E15,900,000); the expenditure to £E15,470,000 (estimate, £E15,400,000). According to Sir Paul Harvey, the financial outlook is favorable: "The revenue returns of 1912 show an aggregate expansion of £E722,000 over the preceding year, about £E100,000 of which, however, does not represent real increase in revenue, being counterbalanced by expenditure on the other side of the account. . . . The surplus on the ordinary budget of 1912 is £E2,045,000, and the reserve fund shows, on balance, an increase of £E277,000. . . . It has been found possible for 1913 entirely to do away with the subvention for civil expenditure in the Sudan. . . . On the other hand, the Egyptian customs will no longer take the duties on goods imported through Egypt into the Sudan." The military subvention, which properly belongs under the head of Egyptian military expenditure, will in future be so classed.

The 1913 budget estimates the revenue at £E16,130,000 and the expenditure at £E15,630,000. Estimated receipts from direct taxes, £E5,609,000; railways, £E3,957,000; customs, £E2,119,000; judicial fees, £E1,745,000; tobacco, £E1,714,000. Estimated expenditure for the various ministries, provincial administration, etc., £E5,630,847; railways, posts, and telegraphs, £E2,690,746; service of the debt, £E3,933,411; public security, £E1,048,664; tribute, £E865,041; pensions, £E560,000; khedival civil list, £E280,996; etc.

The total outstanding capital of the debt December 31, 1911, was £94,621,660; charge on account of interest and sinking fund, £E3,557,000; paid off during the year, £271,980; resulting in a total capital, December 31, 1912, of £94,349,680 and an annual charge of £E3,552,000.

Depositors in the savings bank increased by 147,352, the total number at the close of 1912 being 265,003 (including 127,927 rural depositors), of whom 234,904 were Egyptians. Post office savings banks have been extended all over the country.

GOVERNMENT, ETC. Abbas (II.) Hilmi was in 1913 the reigning khedive. The real ruler of Egypt is Field Marshal Viscount Kitchener of Khartoum, British agent, consul-general, and minister plenipotentiary. Financial adviser, Sir Paul Harvey.

Plague decreased from 1656 cases in 1911 to 884 in 1912; pneumonic cases 178 in 1911 and 114 in 1912; deaths, 1041 and 441; mortality rate per cent., 62.9 and 49.9. The percentage of infant mortality continues extremely high. Mr. Alexander Coote made suggestions resulting in the establishment of international societies for suppression of the white slave traffic, which increases rather than decreases.

The mixed court of appeals loses by resignation two eminent counselors, Antoine de Korizmics (1886), succeeded by Bela de Zoltan, and Casimir Prunieres (1886), succeeded by Francis Laloë. In addition to the cantonal law, the government has inaugurated other legislative intervention for the protection of the fellahs, such as that raising the rate of interest on savings bank deposits and providing increased facilities for making deposits; the insertion in

the penal code of provisions for the punishment of usury; the grant of small holdings (not over five feddans) of reclaimed lands on easy terms to small cultivators; the institution of local commissions for ascertaining the amount of indebtedness and means of relief without recourse to usurers, one of the modern and most mischievous of the plagues of Egypt.

HISTORY

THE NEW LEGISLATIVE ASSEMBLY. A constitutional reorganization in the direction of more representative government made the year 1913 a memorable one in Egyptian history. Under the system inaugurated in 1883 a general assembly and legislative council were nominally the organs of popular sentiment; but the General Assembly was summoned only at intervals, often only once in two years, and then only to authorize the imposition of some new direct, personal, or land tax or to approve a public loan. The Legislative Council, of whose 30 members only 16 were elected, met regularly every winter, but possessed only advisory powers, and was frequently criticised for its indifference to public business. The government, under these circumstances, was really carried on by British officials in the name of the khedive. The present British agent, Lord Kitchener, who has already earned the right to be called "the friend of the fellahin," desiring to bring about a more equitable political representation of the agricultural population, and possibly wishing to forestall democratic agitation, favored a scheme for consolidating the General Assembly and the Legislative Council into one body with real legislative functions. The consent of the khedive was obtained, and on July 20 a khedival decree was published abolishing the Legislative Council and the General Assembly and constituting a new Legislative Assembly and conferring upon it the important right to initiate legislation. The ministry may still disregard the will of the advisory body, but only after the measure in question has been thrice discussed by the assembly. This provision, it was felt, would make arbitrary action on the part of the ministry both unpleasant and unusual. The membership of the Legislative Assembly is partly elective, partly appointive. It contains 66 elected members out of a total membership of 89, i.e. 74 per cent., whereas the Legislative Council had only 16, or 53 per cent. of its 30 members elective. The manner of election was also reformed. The elected councilors are chosen by elected electoral colleges as before, but in place of the old system, whereby each town or village, regardless of size, designated one elector, a scheme was introduced dividing the country into 66 equal electoral districts and within those districts apportioning the electors on a basis of population. One-third of the 66 councilors are to be renewed every two years. The biennial elections consist of two stages: the choice of elector-delegates by popular vote and the designation of the councilors by the elector-delegates; in addition, there might be second elections, in case an absolute majority was lacking. The other 23 members of the Legislative Assembly included the ministers and other persons appointed by the government in such a manner that in the Assembly there

would always be four representatives of the Copts, three Bedouins, two merchants, one engineer, one pedagogue, and one municipal representative.

October 26 was fixed as the date on which the first stage of the election should take place. The balloting was quiet, although in some constituencies the competition was very keen—so keen, in fact, that second elections had to be held. On December 13 electors met to choose the councilors. Of the 66 councilors elected, about 20 were known to hold views which would lead them to oppose the government. Saad Pasha Zagloul, a Nationalist of Cairo, was named as the probable leader of this group. The opening of the Legislative Assembly by the khedive will take place January 20, 1914.

LORD KITCHENER'S REFORMS. Lord Kitchener's report, published in May, gave a sweeping review of the plans for promoting prosperity in Egypt. The reclamation of land by irrigation, the extension of education, the possible development of rural credit, and the development of mineral and industrial resources were among the topics mentioned. The protection of the fellahin (peasantry), planned in 1912, was now an accomplished fact under the five feddans law (promulgated December 4, 1912 and subsequently extended and amended), a measure somewhat akin to the United States homestead laws and the Punjab land alienation act. "It gives protection to the small cultivator of five feddans against expropriation of his land, house, and farming utensils for debt The protection of the poorer fellah in this manner was rendered necessary by the action of the small foreign usurers, who scattered throughout the country in the villages, and financed by various banks, were able, with the support of the capitulations, to lend money on mortgage to fellaheen at exorbitant rates of interest, 30 to 40 per cent., and even higher, being not unusual charges." While safeguarding the small proprietor's tenure, the law makes it more difficult to borrow money, and it is quite possible that the next step will be a rural credit scheme. Another much-discussed reform, the protection of minors against the greed or dishonesty of guardians, was not yet embodied in the law. The Legislative Council had approved the measure, to be sure, but joined with the protection of minors bill was a succession dues bill, and to the latter the councilors were decidedly opposed. The succession dues bill imposed duties on inheritances, ranging from $\frac{1}{2}$ per cent. on the net value of estates between £1000 and £2000 to 3 per cent. on estates over £25,000; and even higher taxes were imposed on inheritances of distant relatives. Estates under £1000 in value were exempted. Many other plans were foreshadowed; among them a more extensive education in domestic science for girls, the prevention of flagrant abuse in the prison system, and the establishment of a food-inspectorate at Cairo. Moreover, a commission appointed by the minister of finance recommended that the present system of sharp discrimination between the ordinary and extraordinary budgets, as provided by the Anglo-French agreement of 1904, be done away with and that all expenditure be included in one general budget.

NEW MINISTRIES. On November 20 decrees

were signed which created two new portfolios in the cabinet, the portfolios of *Wakfs* and of agriculture. The reorganized ministry was as follows: Premier and minister of the interior, Mohammed Said Pasha; finance, Said Zulficar Pasha; public works and war, Ismail Sirri Pasha; justice, Hussein Rushdi Pasha; education, Ahmed Hilmy Pasha; foreign affairs, Yusef Wahba Pasha; *Wakfs*, Ahmed Heshmet Pasha; agriculture, Mohammed Moheb Pasha.

EICHLER, KARL N. An American musician, died August 9, 1913. He was born in Germany in 1826, and began the study of music at Leipzig, at the age of eight, under Hermann. At an early age, he removed to the United States and settled in Boston. He was the founder of the (German) Germania Orchestra, which later was the nucleus of the Boston Symphony Orchestra. For nearly 40 years he was director of music at Harvard commencements. During the last years of his life he devoted most of his time to violin teaching. At the time of his death he was the oldest living member of the Boston Symphony Orchestra.

ELECTION OF SENATORS, DIRECT. See ELECTORAL REFORM.

ELECTORAL REFORM. The more important measures passed by the State legislatures in 1913 relating to electoral reform are noted below.

INITIATIVE AND REFERENDUM. Constitutional amendments providing for initiative and referendum were adopted at the election in November, 1912, by Idaho, Nebraska, and Wyoming, and the legislatures of 1913 in these States passed measures putting these amendments into effect. Constitutional amendments providing for initiative and referendum were submitted by the legislatures in 1913 in Iowa, Minnesota, North Dakota, and Texas by the people. The legislature of Arizona enacted laws for carrying into effect the existing initiative and referendum provisions of the constitution of the State. In the election in November, 1912, proposed constitutional amendments providing for the initiative and referendum were rejected by the voters in Wyoming and Mississippi. The amendments failed for lack of sufficiently large vote, although the vote on the subject in the two States named was respectively five to one and two to one in favor of the amendments. The legislature of Arkansas in 1913 extended the reform municipalities. The legislature of Massachusetts passed a law to provide for submitting to the voters, on official ballots, questions of public policy. An act to provide for the submitting to the people the article of amendment to the constitution authorizing the referendum, was also agreed to by the legislature. A number of States during the year enacted laws regulating the circulation of the initiative, referendum, and recall petitions, and otherwise dealing with the administration of existing laws on the subject.

THE RECALL. Constitutional amendments providing for the article were adopted at the election of November, 1912, by Arizona, Colorado, Idaho, Nevada, and Washington. In Colorado the constitutional amendment adopted included the article of certain judicial decisions. Laws putting these amendments into effect were passed by the legislatures of these States

in 1913. Proposed constitutional amendments providing for the recall were submitted to the voters by the 1913 legislatures of Kansas and Minnesota.

PRIMARY ELECTION LAWS. Primary election laws in one form or another were enacted in California, Florida, Hawaii, Idaho, Iowa, Kansas, Minnesota, Montana, Missouri, New Hampshire, Ohio, Pennsylvania, and Texas. There were also some amendments of existing primary election laws in other States. In Illinois the primary election laws were amended in many respects, including provision for presidential preference primaries, and for the selection of members of controlling committees of political parties and delegates to political conventions. In Vermont the legislature submitted to the vote of the people, the question of whether they prefer a presidential primary system, whereby voters may instruct delegates to political conventions, or a direct primary, whereby electors vote directly for candidates for State, congressional, and county officers.

DIRECT ELECTION OF SENATORS. The Seventeenth Amendment to the Constitution, providing for the direct election of Senators, having been ratified by a sufficient number of States, went into effect in 1913. The first election held under this amendment was in Georgia, where Senator Bacon was reelected on July 15. The senatorial vacancy caused by the death of Senator Johnston of Alabama, revealed a weakness in the amendment, in that it did not provide for a temporary appointment of senators when the State legislatures were not in session. Measures were introduced in Congress to provide for this, but had not been acted upon at the end of the year.

CORRUPT PRACTICES. Corrupt practice acts were adopted by the legislatures of Arkansas, Montana, Nevada, and Ohio. The Oregon legislature amended the laws on the subject.

LOBBYING. The Ohio legislature passed a stringent law regulating lobbying, under which a person engaged in lobbying must file a statement with the Secretary of State, and obtain a certificate, and an itemized statement of disbursements must be filed.

SHORT BALLOT. The movement for a short ballot showed progress in the legislative sessions of 1913. In their messages to the legislature several governors embodied recommendations for the principle, and bills introducing it into effect were introduced in the Senate, and the legislatures of Michigan, Ohio, and New York, among others. Bills for applying the principle to county governments were introduced in the legislatures of Wisconsin, Kansas, Iowa, and Washington. The governors who specifically recommended or asked for consideration of the short ballot in their messages were Governors Cox of Ohio, Clark of Iowa, Ammon of Colorado, Ferris of Michigan, and Lister of Washington. Several other governors who were not officially committed to the principle personally expressed views favorable to its adoption. The statement of Governor Cox is valuable in defining the principle of the short ballot, and it is given herewith. After quoting the Ohio Democratic State platform, which promises "a short ballot in the selection of administrative officers as a means of insuring greater scrutiny in the selection of public officials and for fixing and centralizing responsibility," he added:

"In keeping with the intent of the short

ballot provision the legislature should abolish as elective the offices of dairy and food commissioner, and clerk of the Supreme Court, both of which are of legislative origin, making the former position appointive by the governor and the latter by members of the Supreme Court. An amendment to the constitution should be initiated, making the positions of secretary of State, attorney-general, treasurer, and auditor executive departments to be filled through appointment by the governor. This would leave only the governor, lieutenant-governor, and judges of the Supreme Court to be elected. The result would insure harmony of action in the State department, and centre responsibility in the executive. The several executive department heads could then act in an advisory capacity with the governor as his cabinet. This is identical with the Federal plan which is conceded to be efficient."

As will be noted from these recommendations of Governor Cox, the term "short ballot" does not refer simply to physical size. It proposes not a mere reform of the machinery of election, but an actual change in the structure of State government.

ELECTRICAL ENGINEERING. See AUTOMOBILES; ELECTRIC POWER, TRANSMISSION OF; RAILWAYS; WIRELESS TELEGRAPHY AND TELEPHONY; ETC.

ELECTRICAL INDUSTRIES. The early months of 1913 were marked by great activity among the electrical manufacturing interests, but the pace slackened greatly in the late months of the year, due to the uncertainties incidental to changes in political control. The several public utilities in the electrical field failed to sustain their extraordinary rates of growth, notably the central station industry, whose rate of gain had formerly been about 20 per cent. annually. A leading authority on the growth of electrical industries contributes the following estimates of the gross income of electrical industries in 1912 and 1913:

	1912	1913
Electrical manufactures.....	\$ 350,000,000	\$ 375,000,000
Electric railways.....	625,000,000	650,000,000
Central stations.....	450,000,000	450,000,000
Telephone service.....	350,000,000	350,000,000
Telegraph service.....	85,000,000	85,000,000
Isolated plant service.....	125,000,000	125,000,000
Miscellaneous	125,000,000	125,000,000
Total	\$2,110,000,000	\$2,160,000,000

ELECTRIC BATTERIES. The storage battery enjoys a steady increase in service in connection with the propulsion of motor vehicles, industrial trucks, baggage and freight trucks, mine locomotives, street cars, and submarine craft. The electric vehicle gains slowly in popularity because of its high first cost. An alliance between Mr. Edison and a leading manufacturer of low-priced gasoline cars was reported, late in 1913, the object being the production on a very large scale of a battery-propelled vehicle at a cost of \$750. The success of this venture would bring the electric vehicle, whose operating economies were widely recognized, into widespread use. The great vogue of electrically operated appliances for signaling, starting, lighting, and ignition in gasoline automobiles created an enormous market for portable battery sets. A reliable authority estimated that 500,000 cells had been produced for these purposes. Im-

provements in storage cells tended toward weight reduction and increased in ruggedness. A new type of cell had a semi-dry electrolyte, whose advantages were claimed to be freedom from spilling and evaporation. In another new type only a part of the available active material was initially formed, the remainder being gradually made active during the life of the cell. This prolongs the life of the cell and sustains its initial storage capacity.

ELECTRIC LIGHT AND POWER. See MUNICIPAL OWNERSHIP.

ELECTRIC LIGHTING. The most important new illuminant produced in 1913 was the nitrogen-filled tungsten lamp. Many years ago experiments were conducted by Edison and others with nitrogen-filled carbon lamps in the hope of increasing the life which could be secured at a high temperature of incandescence. The failure of the early experiments is in marked contrast to the success of this arrangement with tungsten filaments of large diameter. The reduction of evaporative tendency of the incandescent metal due to the gas pressure permits a very high temperature to be sustained for a long period of life. The increased heat losses by conduction and convection are more than offset by the higher luminous efficiency of the filament if its diameter is relatively large. Filaments for gas filled lamps are prepared by coiling tungsten wire about a mandrel of small diameter into a close helix, which forms a very compact luminous element of excellent mechanical strength. As the tungsten softens appreciably when in operation the short length of the helical filament greatly simplifies the supporting problem. Nitrogen-filled lamps are provided with relatively long bulbs, affording ample gas-cooling space above the filament. Blackening occurs only in the upper portion of the bulb and causes no reduction of the downward light. The efficiency which can be obtained by this arrangement improves with the size of the lamp up to 1000 candle power. For this and larger sizes a performance of one-half watt per candle power was obtained with a life of from 1000 to 2000 hours. The first field to be entered by the new lamp was that of series street lighting on alternating-current systems. The lamps are arranged to operate at 20 amperes and relatively low voltage through series transformers. The housing and enclosing globe closely resemble those of arc lamps. The light is a satisfactory approach to white, is extremely steady, and is unaffected by winds. The maintenance and operating costs of a 1000 candle-power unit are less than those associated with an arc lamp of similar illuminating power. Nitrogen-filled lamps have little advantage over vacuum tungsten lamps in efficiency below a candle power of 500.

The standard form of tungsten lamps made very rapid progress in displacing carbon lamps of all types. In 1912 the tungsten lamps constituted for the first time a majority of those produced and used. Many central station companies provided free renewals of tungsten lamps in sizes exceeding 100 candle power. The modern lamps showed marked improvement in strength, in uniformity of rating and life, in the absence of bulb-blackening, and a gain of from 5 per cent. to 15 per cent. in efficiency over the lamps of 1912. The coiled-filament type of lamp was extensively used in headlights, projectors, and signal lamps, where a closely

concentrated source of light was imperative. Series tungsten lamps were used in very large numbers to displace incandescent gas mantles in street lighting.

Among the arc lamps the performance of the enclosed flame type showed the most marked advance. Series alternating-current arcs of this class were perfected and had a very wide adoption for street lighting. With the advent of improved white light electrodes which gave efficiencies equal to those formerly attained only with yellow electrodes the latter decreased in use. As a result the flame arc increased greatly in favor as a street illuminant and was installed in very large numbers. Yellow flame arcs giving performances of 0.2 watt per mean hemispherical candle were widely used in Europe. The inverted magnetite arc supported by an iron standard of pleasing design gained an important place in decorative street lighting.

American interest in the neon vacuum tube lamp was greatly stimulated by the demonstrations made by the inventor, M. Claude, in American cities. These tubes are operated in lengths of about 65 feet and produce an intensity of 60 candle power per foot, or much higher than that of the Moore tube. The spectrum shows a pronounced excess of red, but the effect of combining the neon tube with the greenish mercury arc is a very satisfactory approach of white.

In the field of general illumination 1913 was noteworthy for the great gain in favor of the semi-indirect method, for the general advance of the standards of street illumination in cities of moderate size, and for the greatly increased response on the part of the general public to the campaign conducted in recent years by the professional lighting societies for improved artistic and hygienic standards of lighting.

ELECTRIC POWER, TRANSMISSION OF. The electric power transmission developments of 1913 fully sustained the trend toward higher working voltages manifested during the five preceding years. The new record of 150,000 volts set by the opening to service of the 240-mile transmission line from Big Creek, Cal., to Los Angeles was doubtless but one step in the progress. There appeared to be no serious obstacle to the use of higher voltages as the economic situation warranted. The number of systems operating at 100,000 volts was very greatly increased in the year. Transmission at this voltage had made a beginning in Asia. A line was placed in service at this voltage between the Tata plant in the Ghats and Bombay. The power developed, approximately 66,000 kilowatts, was largely used by cotton mills. In America the year's most conspicuous event in hydro-electric circles was the successful inauguration of service from the completed half of the great Keokuk plant on the Mississippi. The capacity of 150,000 horse power was being doubled and much of the output was transmitted at 110,000 volts to St. Louis. When completed this will be the largest power plant of any type in the world.

Permits were granted by the Federal authorities for the immediate development of five great projects on the public domain in the Pacific district. The Pacific Light and Power Corporation was building a series of four plants totaling 150,000 horse power, of which the

Big Creek plant was already in service. The Great Western Power Company was developing plants on the Feather River with a total capacity of 350,000 horse power. An important feature of this system was to be a great water reservoir covering 43 square miles. The Southern California Edison Company was building a system of four large plants on the Kern River. The Pacific Gas and Electric Company was engaged in the development of the South Yuba River and built in that connection the highest masonry dams in existence. All the above were high head developments in connection with transmission systems to the main industrial centres of California. The fifth permit was taken out by a Spokane company for a great development on the Pend d'Oreille River, where 350,000 horse power was available. The permit required the development of 50,000 within three years. The Federal authorities also granted to the holders of concessions on the American side of the Niagara River the right to add 25 per cent. to the present developments.

The year 1913 was important in the development in the southern Appalachians. The Hale's Bar station on the Tennessee River with 45,000 kilowatts of capacity introduced some unique features. (See DAMS.) The head at this plant is exceedingly variable. In order to insure to each generator the power necessary to develop its full capacity each shaft carried three turbine wheels and the number in use was varied according to the head. The Tallulah Falls plant had a maximum capacity of 70,000 kilowatts and used the highest head reaction wheels yet installed, viz., 600 feet. Power was transmitted from this plant to the Atlanta district at 100,000 volts. This system was unique for the extensive use made of outdoor substations and switching equipment.

The largest single development undertaken in Canada was the Cedar Rapids plant on the St. Lawrence, nearing completion at the end of the year. The initial capacity was to be 100,000 horse power and extensions were planned to obtain an ultimate capacity of 160,000 horse power. Of this output a single customer, the Aluminum Company of America, had contracted for 80,000 horse power. The remainder was to be transmitted to Montreal. Another important Canadian item was the extension of the 100,000 volt transmission system of the hydro-electric commission of Ontario from St. Thomas to Windsor, a distance of 130 miles.

The most interesting of the new plants installed in Europe was one of 15,000 horse power at Martigny, Switzerland. This plant employs the largest head in the world, 5400 feet. But 30 cubic feet of water per second are required to develop the full 15,000 horse power. The Thury system of transmission making use of a constant direct current gained much in prominence through the project developed to transmit 20,000 kilowatts from the hydro-electric plant at Trollhättan, Sweden, to Copenhagen. A careful analysis of the problem showed a marked advantage in investment and operating economy in favor of the Thury system operating at 90,000 volts, with earth return over the three-phase system at 100,000 volts. The latter was handicapped by the impracticability of crossing the Strait of Oresund with a submarine cable at voltage higher than 20,000, necessitating the use of voltage changing substations. A 90,000-volt single conductor cable for direct

current was regarded as entirely practicable. The direct current system has other incidental advantages, principally the simplicity of the problem of line construction and insulation.

An important development in the transmission of power developed in steam plants at mining centres was shown by the system of the Central Illinois Service Company, which serves by a 33,000-volt network 125 communities in 40 counties of Illinois, besides a great number of rural customers. Power was generated in three large stations at central points. The transmission system is 700 miles in length. Great advantages accrue to the smaller communities through moderate rates, all-day service and the attractive conditions afforded for industrial development. This system also opens an immense field for the application of electric power to agriculture.

ELECTRIC RAILWAYS. Conspicuous among the electric railway developments of 1913 were the large number of electrification projects for which plans were announced. The high-voltage direct-current systems of motive power operating at trolley voltages of 1200 and 2400 were selected in a very large majority of these cases. The most ambitious projects of this type were located in the mountainous districts of the Northwest. The Chicago, Milwaukee, and St. Paul Railway was proceeding with the electrification of a division 113 miles in length in the State of Montana and was soon to extend the electrified section over a length of 450 miles. Power was to be obtained from hydro-electric companies operating in the district. An equally important development was the electrification of 450 miles of the Great Northern system between New Rockford, S. D., and Lewiston, Mont. The Canadian Pacific Railway was at work on the electrification of its Rossland division. All these projects were being developed on the 2400-volt system, following the successful operating experience obtained with this system on the Butte, Anaconda, and Pacific line during 1913. A 2400-volt system between Kalamazoo and Grand Rapids was also approaching completion. The Canadian Northern system was engaged in the electrification of its Montreal tunnel (see TUNNELS) and terminal facilities, also using the 2400-volt system.

Important interurban systems using 1200-volt direct-current equipment which were put in operation during 1912 included the Nashville-Gallatin line; the Oregon Electric Railway, a line 122 miles in length on which sleeping cars and observation trains were operated; the Kansas City, Clay County, and St. Joseph Railway; and an extensive network in the suburban district about San Francisco. The above cases pointed to a growing preference among American engineers for the high-voltage, direct-current systems, which was in marked contrast to the firm allegiance of Europeans to the single-phase alternating-current system. Very severe criticisms were made of the recent American practice by prominent European engineers, but experience was not sufficient to afford final evidence in the case. Recent European practice tended to the use of very high trolley voltages in single-phase systems and to a more extended application of three-phase induction motors. The latter type was given an extensive test in connection with the development work for the Berlin, Magdeburg, and Leipzig electrification, which was 100 miles in length. The

successful results point to the use of the three-phase system.

A distinct innovation in electric traction was planned in connection with the electrification of a coal road between Bluefield and Vivian, West Virginia. The line crosses the ridge of the Alleghenies and has very heavy grades. The locomotives are designed for the operation of coal trains of 3500 tons and are to be equipped with the single-phase induction motors operating at 11,000 volts and 25 cycles. This marks the first appearance of single-phase induction motors in the traction field and it is noteworthy that the service planned is exceptionally severe.

Several important developments in city transportation systems may be found both in America and Europe. Paris and Berlin were actively engaged in the electrification of large suburban systems. In Berlin a new double-tracked cross-city line was being constructed. The length was to be six miles, mainly in tunnel. Subway construction work went actively forward in Boston and New York. (See RAPID TRANSIT.) The municipal authorities in Chicago brought forward a comprehensive scheme of subway development. The several elevated lines in Chicago were brought under unified control with universal transfers and through routing of trains as immediate results. The Pennsylvania Railroad began an extensive electrification of terminal facilities and suburban lines in Philadelphia. The first link in the construction was that between Broad Street Terminal and Paoli, a distance of 20 miles. This work was part of a comprehensive plan to electrify the entire main line between New York and Washington. Contrary to its practice in New York, where the company maintains extensive power stations, the power for the Philadelphia section was to be purchased from the local central station company. The policy of railway companies of all classes to contract with central station companies for power supply was gaining rapid headway. The chief advantages were found in the relief of the railway company from the maintenance of a heavy item of investment and the low rate which can be granted for wholesale power supplies when the peak load does not coincide with the peak of power supplied for public use.

New records for power and tractive capacity were set by the new locomotives of the New York Central system. The new 100-ton type will develop 1460 hp. continuously, 2000 hp. for one hour, and 5000 hp. for brief periods. The new 110-ton type will develop 2000 hp. continuously and 2600 hp. for one hour. The latter type will operate a 1200-ton train continuously on straight level track at a speed of 57 miles per hour. An interesting new type of locomotive was that provided for the St. Paul, Rochester, and Dubuque line. Motive power is provided for the motors by a gasoline-electric generator. The equipment is similar to that previously used in gasoline-electric cars but on a much heavier scale. This locomotive will haul a 5-car train at a speed of 45 miles per hour and affords a great saving in labor and fuel as compared with the ordinary steam type.

A unique type of electric tractor for the switching of freight cars in city streets was placed in service by the Pennsylvania Railroad. It is essentially a storage-battery locomotive with rubber blocked tires like those

of heavy motor trucks. The battery consists of 80 Edison cells. The great adhesion permits a very great tractive effort to be developed. The gross weight is 14 tons, the normal draw-bar pull is 8000 lbs. and the maximum draw-bar pull 21,500 lbs. In test the tractor successfully bucked a large steam freight locomotive with its throttle wide open, in addition to a dead load of three cars.

ELECTRO-CULTURE. See AGRICULTURE.

ELECTRO-METALLURGY. See METALLURGY.

ELECTRO-THERAPEUTIC TREATMENT. See CANCER.

ELLIOTT, HOWARD. An American railway official, appointed in 1913 president of the New York, New Haven, and Hartford system to succeed Charles S. Mellen (q.v.). He was born in New York City in 1860, and graduated from the Lawrence Scientific School at Harvard University in 1881. He served in various connections with a number of railways until 1887, when he was appointed general freight and passenger agent of the St. Louis, Keokuk, and Northwestern Railroad Company. From 1891-6 he was general freight agent for four roads included in the Burlington system, and from 1896 to 1902 was general manager of these roads. He was second vice-president of the Chicago, Burlington, and Quincy Railroad in 1902-3, and in the latter year was appointed president of the Northern Pacific Railway Company. His administration of this road was so successful that he became known as one of the ablest railway presidents in the United States. In 1913 he was chosen to succeed Charles S. Mellen as president of the New Haven system. (See RAILWAYS.) He was an overseer of Harvard University and a member of several scientific and historical societies. A volume of his articles on subjects connected with the railways was published in 1913 with the title, *Truth About the Railroads*.

ELLIS, ROBINSON. An English scholar and educator, died October 9, 1913. He was born at Barming, Kent, in 1834, and was educated at Rugby and at Balliol College, Oxford. In 1858 he was appointed fellow of Trinity College, Oxford. He became professor of Latin at the University College, London in 1870, and from 1883-93 was Latin reader at Oxford. In the latter year he received the appointment of Corpus professor of Latin literature at Oxford University. He was a voluminous writer on classical subjects. Among his published writings were *Specimens of Latin Palæography from Manuscripts in the Bodleian Library* (1903); *Catullus in the XIV Century* (1905); and *The Annalist Licinianus* (1908). He also edited the works of many Greek and Latin writers, and contributed numerous articles to English and foreign philological journals. His last work was an edition of *The Amores of Ovid* in 1912.

EMETINE HYDROCHLORIDE. The hydrochloride, $C_{10}H_{14}N_2O \cdot 2HCl \cdot 2H_2O$, of an alkaloid found in *Cephaelis ipecacuanha*. It occurs as a white crystalline powder, soluble in water and alcohol. Emetine acts similarly to ipecac, but is relatively more nauseant and less emetic, and causes less renal irritation, but more cardiac depression. In the form of injections the drug has been reported to have special value in amebic dysentery. It is also used in small doses as an expectorant.

ELECTRIC LOCOMOTIVES

1. WESTINGHOUSE SINGLE-PHASE ALTERNATING CURRENT HIGH SPEED PASSENGER LOCOMOTIVE, NEW YORK, NEW HAVEN AND HARTFORD RAILROAD.
2. GENERAL ELECTRIC COMPANY 600-VOLT DIRECT CURRENT ARTICULATED LOCOMOTIVE FOR NEW YORK CENTRAL AND HUDSON RIVER RAILROAD.
3. GENERAL ELECTRIC COMPANY 2400-VOLT DIRECT CURRENT ELECTRIC LOCOMOTIVE, BUTTE, ANACONDA AND PACIFIC RAILWAY.

EMIGRATION. See AUSTRIA-HUNGARY under *Emigration Scandal*, and IMMIGRATION AND EMIGRATION.

EMPLOYERS' LIABILITY. See WORKMEN'S COMPENSATION.

ENGINEERING. Engineering progress in 1913 was marked by the completion of some important projects and the initiation of others. In civil engineering reference should be made to BRIDGES for an account of some notable structures, to PANAMA CANAL and CANALS for a discussion of various undertakings in the construction of large waterways, to the articles AQUEDUCTS, WATER SUPPLY, WATER PURIFICATION, and WATER WORKS for a consideration of the great aqueducts for the city of New York and Los Angeles, as well as for the general problems involved in the supply of pure water. The articles DAMS, CONCRETE, FOUNDATIONS, and TUNNELS also discuss important construction of the year, while DOCKS AND HARBORS show that the ports of the world were undergoing improvement to provide for ships of ever-increasing size. To the article RAILWAYS reference should be made for a discussion of the economic and operating problems which concerned the railways of the United States rather more than construction; but the record of RAILWAY ACCIDENTS throughout the world has its bearing on engineering problems. RAPID TRANSIT with its subways and TUNNELS for great municipalities involved questions of design and construction; while the various problems, often involving engineering, concerned with MUNICIPAL GOVERNMENT, are discussed under that head. Such titles as GARBAGE AND REFUSE DISPOSAL, and SEWAGE should also be consulted. In electrical engineering the TRANSMISSION OF POWER BY ELECTRICITY, involving the construction of great hydro-electric plants, was a feature of the year, while under ELECTRIC RAILWAYS developments, especially in high tension direct current systems, were prominent and are there discussed. WIRELESS TELEGRAPHY AND TELEPHONY shows that radio-communication did not stand still in 1913, while the large units described under DYNAMO-ELECTRIC MACHINERY indicate progress in this field. ELECTRIC LIGHTING also showed progress.

In mechanical engineering, see INTERNAL COMBUSTION MOTOR, with what is said of its widening range of application. PUMPING MACHINERY and AUTOMOBILES receive treatment under those heads, and fire apparatus is discussed under FIRE PROTECTION. The STEAM ENGINE and the STEAM TURBINE consider the problems involved in shipbuilding. Attention is directed also to TALL BUILDINGS.

AERONAUTICS is now a recognized branch of mechanical engineering, and its record is fully considered. Sanitary engineering problems are considered under SMOKE PREVENTION, BATH HOUSES, and WATER PURIFICATION, as well as under SEWAGE.

Marine engineering, also, or more properly naval science, in certain aspects, finds treatment under BATTLESHIPS and SAFETY AT SEA.

ENGLAND. See GREAT BRITAIN.

ENTOMOLOGY. In the United States, much important work was done both by the Federal government and by the individual States in economic entomology. Generally speaking this was along two lines, one in research on insects in relation to plants, the

other, their relation to the transmission of disease. In 1912 it seemed to have been clearly demonstrated that infantile paralysis is transmitted through the bite of the stable fly, *Stomoxys calcitrans*, but Sawyer and Herms were unable to confirm this demonstration, though they advise screening against it as a desirable precaution. Brues, however, held to his original belief concerning the relation between the insect and this disease, and reported on the distribution of the fly. Apparently it was of palearctic origin, but has been distributed by man throughout the world, being relatively more numerous in temperate than in tropic climates. The claim was made that the small black fly, *Simulium*, transmits the germ of pellagra, but Forbes, after a careful study of the development and distribution of this insect in Illinois, was unable to trace any relation between the distribution of the fly and observed cases of the disease. The house fly continued to attract attention, and in this connection it is interesting to learn how far they may travel from their breeding places. Hodge found house, stable, and blue bottle flies on the crib connected with the intake of the Cleveland city water supply at a distance of at least six miles from shore, and where there were no possible breeding places. This would indicate that they may be carried at least that far by winds. Skinner found, in the vicinity of Philadelphia, that the earliest flies which appeared in the spring had evidently just emerged from the pupal cases. This is contrary to the usual notion that they always pass the winter in the imagal condition.

Strickland, working on the larvæ of the black fly in eastern Massachusetts, found that there they are attacked by a parasitic fungus which is fatal to them and is probably responsible for the relative scarcity of these flies in that section of the country. He suggested that it may be possible to artificially cultivate this fungus, and by spreading it in the regions where the flies are numerous to infect them, and in that way control the pest. The brown-tail and gypsy moths were reported as slowly working their way westward and will soon reach the limits of New York State. A small colony of gypsy moths was found in 1912 at Geneva, N. Y., but was reported in 1913 as having been entirely killed off. In Massachusetts a consolidation of the Federal and State work was effected in 1913, and A. F. Burgess was put in charge. Fiske reported that in the immediate vicinity of Boston there seemed to be a decrease in the numbers of the gypsy moths, but that outside the metropolitan district they were as numerous as ever. About 50 per cent. of the decrease near Boston is due to imported parasites. The moths live, by preference, on oaks, apples, gray birch, and willows, but will not thrive on white pine. Accordingly, owners of forests where direct control of the pest would be impossible because of the expense, are advised to cut their trees and reforest with white pine.

In the vicinity of New York City, the hickory bark borer, *Scolytus quadrispinosus*, was reported as doing much damage. The eggs are laid during August, in holes cut through the bark into the sapwood, the larvæ hatching in September. Local injections of gasoline into the holes were recommended as a practicable way of killing the insects.

As a result of several years of planning, an imperial bureau of entomology was founded in England early in 1913, having for its function a general survey of the noxious insects of the world, and the collection and coördination of all available information concerning them. The practical results hoped for are that any British country may secure information as to what insects it is in danger of importing from other countries and the best measures to be employed against them. It also attempts to identify any insects of economic importance which may be submitted to it, and is to publish a monthly *Review of Applied Entomology* relating especially to investigations on the control of noxious insects. Guy A. K. Marshall was director of the bureau, and editor of the journal.

EPILEPSY. A possible connection between epilepsy and the pituitary body (a small gland at the base of the brain) is shown by the X-ray. While the gland itself cannot be photographed, Johnston noticed decided departures from the normal in the bony hollow in which the gland rests. These changes consisted in an overgrowth of the anterior and posterior clinoidal processes, which are four bony spines growing from the corners of the sella turcica (the bed in which pituitary gland lies). In some cases the clinoidal process increased to such an extent that they covered the gland almost entirely. The changes just noted were particularly confined to epileptics who developed the disease between the ages of 15 and 35 years, the attacks beginning as mild evidences of *petit mal* and gradually increasing in severity and frequency. In line with these observations were those of Gelma, who treated cases of typical epilepsy with thyroid extract. It was known that the pituitary gland and the thyroid have a reciprocal influence on nutrition and growth, and it was possible that the administration of glandular extracts would prove of service in the treatment of certain cases of this disease. Gelma's patients were cured.

Many cases of epilepsy are undoubtedly due to minute or gross traumatism of the nervous system, as is frequently shown in operations on the brain. Pierret found by animal experimentation that epilepsy can be produced by various sorts of traumatism of the nervous system. He believed that in many cases of idiopathic epilepsy the patients had had some infectious disease localized in the nervous system, which had damaged the nerve cells and left behind it cicatricial areas. Later some intoxication takes place and toxic products, acting on these sclerotic foci, cause convulsions, which may be motor, sensory, or psychic. The rational treatment, therefore, is to protect the patient from all possible causes of intoxication from within or without. Some support for this view was found in the 18th annual report of the Craig Colony for Epileptics, Sonyea, N. Y. (1912). Notable among the pathologist's findings were that a considerable percentage of epileptics have various congenital deformities or development defects, too diverse to classify; that various forms of encephalitis bearing a relation, possibly, to the infectious disease, are also found; that constipation or intestinal stasis resulting in intestinal toxemia is constantly present. Nephritic changes are present in a large number of cases, due, it is believed, to high blood-pressure and congestion during

attacks, it being found that albuminuria accompanies these attacks. In case of death during or immediately following a convulsion intense congestion of the kidneys is always found. The brain atrophies of various regions as well as internal hydrocephalus are frequently present, and also meningeal adhesions and thickenings, but neither these nor the tumors found could be shown to bear any constant relation to the epilepsy.

ERDMAN ACT. See **ARBITRATION AND CONCILIATION, INDUSTRIAL.**

ERITREA. An Italian colony on the Red Sea, covering an area estimated at 45,800 sq. miles and having a population of about 279,000. Capital, Asmara. The important product is salt, sent to southern Abyssinia, where it is the monetary currency. The 1910 imports were valued at 16,372,830 lire; exports, 7,277,865; transit, 3,857,351. Tonnage entered, 183,532. The Massaua-Asmara railway will be extended to Keren. Revenue (estimated) for 1910-11, 8,977,750 lire (subvention, 6,350,000); expenditure, 7,223,700. A governor administers the colony.

ESPERANTO. See **INTERNATIONAL LANGUAGE.**

ESTRUP, JACOB BRONNUM SCAVENTUS. A Danish statesman, died December 24, 1913. He was born in 1825; early entered public life; and from 1875 to 1894 was premier and minister of finance. In 1900 he was made a member of the upper house. He was for many years the ally of the king in defying the parliament when it insisted on representatives of the people being appointed to cabinet offices.

ETHNOLOGY. See **ANTHROPOLOGY.**

EUGENICS. That science can do much for the improvement of the race is the growing conviction of trained scientific intelligence the world over. This conviction found organized expression in America, when, in 1910, with the financial assistance of Mrs. E. H. Harriman, John D. Rockefeller, and others, the Eugenics Record Office at Cold Spring Harbor, Long Island, N. Y., was founded, and began its work under the directorship of Charles B. Davenport—a work which thus far has been distinguished by its conservative scientific methods and guarded generalizations and recommendations. This institution aims to be a repository and clearing house of eugenical knowledge, and a centre from which diverge a series of widespread investigations regarding the hereditary consequences of matings, differential fecundity, and the laws governing the inheritance of specific human traits. The ridicule and the objections turned against eugenics are generally directed at extravagant claims in which responsible eugenics do not in fact indulge. The point of view of the eugenists was exemplified in the words of Major Leonard Darwin, president of the International Eugenics Congress of 1912—at which, be it said, no less than 500 delegates were present. "At present," declared Major Darwin, "the most urgent need is for more knowledge."

The year 1913 was marked in a general way by the diffusion of a right understanding of the methods and aims of the new science. Specifi-

cally, a number of facts related to the subject should be chronicled. In the United States, five States passed sterilization laws. These were North Dakota, Michigan, Kansas, Oregon, and Wisconsin. The successful practical operation of such laws was indicated by the strengthening of existing sterilization legislation in Iowa and California. In England and in New Zealand laws designed to prevent procreation in the case of certain classes of criminals and defectives were passed. Spain was notably active in eugenic provisions for the care of pregnant women and infants. The decision to hold the 1915 International Eugenics Congress in New York was reached in 1913. John D. Rockefeller provided salaries for six investigators for as many institutions caring for defective or socially inadequate persons. Through the efforts of the Eugenics Record Office investigations proper to it were, at the end of 1913, being carried on in twenty-nine State institutions. Lectures on eugenics by some competent authority—thanks to the generosity of Mrs. Huntington Wilson—will be given at universities and social settlements. Notable studies, under the imprint of the Eugenics Record Office, have appeared: C. B. Davenport, *The Family History Book*, and *State Laws Limiting Marriage in the Light of Eugenics*; Harry H. Laughlin, *The Eugenics Record Office at the End of Twenty-Seven Months' Work*, and *The Legal . . . Aspects of Sterilization*. A valuable recent book bearing on eugenics in general is Havelock Ellis, *The Task of Social Hygiene* (New York and London, 1912).

See also CARNEGIE INSTITUTION OF WASHINGTON, *passim*; COMMISSION ON UNIFORM STATE LAWS, AND MARRIAGE AND DIVORCE.

EVANGELICAL ASSOCIATION. A religious denomination which has its chief strength among the German-born citizens of the United States. Its doctrine is that of American Methodism, but it is modified in the direction of greater democracy. Communicants are found in nearly all parts of the northern section of the United States and Canada, but there is also considerable strength in the West and South. Missionary work is carried on chiefly among the Italian immigrants. There were, in 1913, 2,110,134 communicants, 1659 churches, and 1003 ministers. For administrative purposes, there are twenty-four districts. The Sunday schools of the denomination teach about 175,000 pupils. The Young People's Alliance, connected with the church, numbers 50,000 members. A publishing house is maintained in Cleveland, O., and there are several philanthropic institutions and hospitals in Chicago, Philadelphia, and in cities throughout the Middle West. The principal educational institution is Northwestern College, at Naperville, Ill.

EXPERIMENTAL PSYCHOLOGISTS, ASSOCIATION OF. See PSYCHOLOGY.

EXPLORATION. (For Arctic and Antarctic exploration, see POLAR EXPLORATION.) **NORTH AMERICA.** The studies along the lines of the Canadian Northern and the Grand Trunk Pacific railroads, which are adding two trans-continental lines to the Dominion, have greatly increased knowledge of the resources and potentialities of wide zones extending through the western part of Canada. Many settlers are now beginning to engage in agricultural and graz-

ing industries in large areas whose economic possibilities were not known five years ago. Studies, also, that have been and are being made in Alaska, such, for example, as those that were summarized in the report of the Alaskan railroad commission in 1913, are giving the public new facilities for the study of Alaskan geography, of the distribution of natural resources and the possibility of utilizing them.

Considerable areas surrounding the headwaters of the Mackenzie River have thus far appeared blank on the official maps of British Columbia. This unexplored region was penetrated by Frederick K. Vreeland of New York, in 1912, who has just published (1914) some description of Laurier and Trident peaks and of other discoveries or explorations in the main range of the Rocky Mountains. From the top of Laurier Peak (7000 feet) he obtained a fine view of the mountains to the north and west, of which he took bearings and assigned them to their approximate position on his map. The mountains are divided into two ranges by a valley about 25 miles wide containing a main stream, flowing south, and its tributaries. The eastern range is chiefly composed of limestone and shale and its summits are more rounded and lower than those of the west. The western range is a rugged chain of serrated peaks extending beyond the range of vision, with several conspicuous snow peaks at the north.

SOUTH AMERICA. Dr. Hamilton Rice returned to New York late in 1913 from his journeys in 1912-13 in the Amazon basin. His detailed account has not as yet been published, but he is said to have done pioneer work among some of the right tributaries of the Amazon, chiefly in the republic of Colombia. His survey work embraced parts or all of the courses of the rivers Ariari, Guaviare, Calamar, Macaya, Inirida, Pafunaua, and Isana. The explorer says that, coupled with his earlier work, his new observations have enabled him pretty well to clear up the geography of the northwest Amazon basin between the Guaviare, Caquetá, and Rio Negro rivers.

Professor Isaiah Bowman of Yale University completed in the Central Andes, last summer, certain lines of investigation upon which he has been engaged since 1907. His field work related chiefly to the anthropogeography of the Puna of Atacama and the adjacent desert of Atacama—the influence that topography, drainage, and climate have had upon the distribution and customs of the people. He completed the season's work by investigating the relations between the now vanished Lake Minchin and Lake Titicaca.

The well-known ethnologist, Dr. Koch-Grünberg, to whom general attention was first called by his exploration of the headwaters of the Rio Negro, and his careful study of the Indian tribes there, has completed his two years' work in the eastern part of the Rio Negro basin and as far north as Mt. Roraima. He made a survey of his whole route, parts of which, as, for instance, the whole course of the Ventuari River, had never been surveyed before. His other work included: Continuous observations of temperature and atmospheric pressure; 1000 photographs and many cinematograph pictures; many phonographic records of native songs and music; ethnographical, botanical, and geological collections; detailed studies

of 21 Indian languages, some hitherto unknown; transcriptions of numerous texts, myths, and legends, and detailed notes on the customs and beliefs of various tribes.

AFRICA. Captain Jacobs, of the German naval service, has been making researches at the large Lake Tanganyika and from his soundings it appears probable, as far as our present knowledge extends, that this is the second deepest fresh water lake in the world. The greatest depth he found was 4189 feet. Up to the time of his work the greatest depth discovered among the great lakes of Central Africa was 2825 feet. As the surface of Tanganyika stands 2559 feet above sea-level, the lake must be regarded as occupying one of the greatest crypto-depressions, for its floor sinks to 1539 feet below sea-level. The deepest fresh water lake is supposed to be Lake Baikal, in Siberia, with a recorded sounding of 4997 feet.

The French government is reported to have sent out parties in the winter of 1912-13 to study suggested routes for railroads across the Sahara to connect Algeria with Central Africa. The reports of these parties seem to show that they regard the scheme as practicable, and involving no serious difficulties. One party traveled southeast from Colomb-Bechar, the southwestern terminus of the Algerian railroad system to Insala, Agades, and Lake Chad. Another party branching off at Insala, went due south to about the latitude of Timbuktu, then turned east and rejoined the first route at Agades. A third, starting from Gao, on the Niger, traveled northward to Silet. All the information will be carefully studied with a view to evolving, if possible, a definite plan for a railroad across the desert.

Mr. L. Gentil, the well-known geologist and explorer of Morocco, has been commissioned by the French government to make economic investigations with a view to developing that country's natural resources. Geographical and other scientific work will also be carried on as far as possible. Our geographical knowledge of Morocco is rapidly advancing under the French régime.

ASIA. Captain F. M. Bailey and Captain Morshead of the India service were reported, at the end of the year, to have just returned to India after successfully exploring the Sangpo River. This river runs for hundreds of miles eastward through the southern part of Tibet. It has long been practically certain, though never proven, that the river was the upper part of the famous Brahmaputra of India. The journey of these explorers was arduous, but they conclusively proved that these two rivers are one and the same. It is said that they found the reported falls, which have been the subject of much speculation, to be non-existent. Details of their journey have not yet been received.

Dr. F. de Filippi and his scientific staff went to India in July to begin their researches in the western Himalaya and the Karakoram. The sum of \$50,000 had been raised to equip the party, which expects to be in the field over a year. Many problems concerning topography, geology, gravity, magnetism, meteorology, the various forms of radiation, etc., will be studied. The investigations will be carried on from Kashmir, over the Himalaya ranges, and through Baltistan and Ladakh into Chinese Turkestan. Among the specialists who are taking part in

the work are Professors Marinelli, geography; Dainelli, geology; Amerio, atmospheric electricity; Marquis Venturigimori, meteorology; Commander Alessio, geodesy; and G. Adetti, astronomy.

OCEANOGRAPHY. Soundings taken by Captain Davis, of Dr. Mawson's Antarctic ship *Aurora*, while on his way to and from Wilkes Land in November and December, 1912, show that a great submarine bank exists to the south of Tasmania. For 100 miles south of that island the ocean bed descends steadily to 2082 fathoms, and then rises till it forms the crest of a ridge at least 150 miles long. As far as is now known, the shallowest waters over the ridge have a depth of 545 fathoms, but as the ocean in adjacent areas east and west sinks to depths of 2450 to 2700 fathoms, the ridge rises at least 11,000 feet above the ocean floor. It is thought that it may be a fragment of a lost continent that at one time connected Tasmania and Antarctica.

EXPLOSIVES. See **CHEMISTRY, INDUSTRIAL EXPOSITIONS.** The two great events of the year were the celebration at Lake Erie in the United States and the exposition in Ghent, Belgium. Of these brief accounts are given below.

PUT-IN-BAY. This celebration had its official inception in 1908, when five commissioners were appointed by the governor of Ohio to prepare and carry out plans for the celebration of the one hundredth anniversary of the battle of Lake Erie, of General Harrison's campaign, and the ensuing century of peace between Great Britain and the United States. Subsequently commissioners were appointed by Pennsylvania, Michigan, Illinois, Wisconsin, New York, Rhode Island, Kentucky, Minnesota, and Louisiana. These, together with five commissioners from the United States, organized on September 10, 1910. Their plans included the Perry Memorial which was raised on a reservation of fourteen acres on a narrow neck of land on Put-in-Bay Island, opposite Gibraltar Island, and extending northward toward Middle Bass Island. It looks out over Lake Erie toward West Sister Island, whence Perry sent his famous message to Harrison. A design by J. H. Freedlander and A. D. Seymour, Jr., was chosen after an architectural competition held in Washington under the auspices of the National Commission of Fine Arts. It consists of a plaza rising in gradual ascent from the water's edge to the level height of twelve feet, and 758 feet long by 461 feet wide. There is a Doric column in the centre 335 feet high from the base to the light in the tripod surmounting the top, which is 300 feet high with a spectator's gallery reached by electric elevators from the crypt at the base. The column is forty-five feet in diameter and thirty-five feet at the top, and is built of granite. A building to the left is for a historical museum and contains a floor space of 3000 square feet, while the building to the right is a memorial emblematic of the centenary of peace between Great Britain and the United States.

The celebration as planned extended from July 6 to September 22, and consisted essentially of a triumphant voyage of Perry's flagship *Niagara*, the hull of which was raised from the mud at Erie and refitted so that the ship presented the same appearance as it did a century ago. After the exercises at Erie the *Niagara*, convoyed by a fleet of representative naval mili-

tia ships of the Great Lakes and the United States revenue cutters, pursued a long itinerary, ending at Put-in-Bay, September 10-11. The culminating event was at Put-in-Bay, where, on the anniversary of the battle, the memorial was dedicated with elaborate ceremonies presided over by Governor James M. Cox, and including an address by former President Taft. A great banquet was held at which there were 1000 guests. Finally, with solemn religious services, participated in by representatives of the United States and the British Empire, the remains of the American and British officers killed in the battle of Lake Erie were disinterred from the burial plot on the shore of Put-in-Bay Island, where they have reposed for a century, and reinterred in the crypt of the Perry Memorial.

SAN FRANCISCO. Since the completion of the plans for the great Panama-Pacific International Exposition (see *YEAR BOOK*, 1912, p. 216) there had come the construction of the main group of exposition buildings, all of which were to be completed before July 1, 1914. The Division of Exhibits is grouped into eleven departments, as follows: A, Fine Arts; B, Education; C, Social Economy; D, Liberal Arts; E, Manufactures and Varied Industries; F, Machinery; G, Transportation; H, Agriculture; I, Livestock; K, Horticulture; and L, Mines and Metallurgy. Among the governments that accepted invitations to make official exhibits are Argentina, Bolivia, Brazil, Canada, Chile, China, Costa Rica, Cuba, Denmark, Dominican Republic, Ecuador, France, Guatemala, Haiti, Honduras, Italy, Japan, Liberia, Mexico, Netherlands, Nicaragua, Norway, Panama, Persia, Peru, Portugal, Salvador, Spain, Sweden, Venezuela, and Uruguay. Also thirty-five States took legislative action looking toward participation and twenty-five chose sites for their State buildings. During the year a government commission was appointed to take charge of the preparation and installation of exhibits to be shown by the various departments and bureaus of the national government. The matter of congresses, associations, societies, and conventions was being cared for by a bureau of conventions and societies, and already a large programme was arranged for. On January 1, 1913, the U. S. Post Office Department placed on sale a commemorative series of Panama-Pacific postage stamps in four denominations.

SAN DIEGO. (See *YEAR BOOKS*, 1911, p. 247, and 1912, p. 216.) The Panama-California Exposition will be held in San Diego, California, from January 1 to December 31, 1915. The plan for the exposition embraced about 400 acres. All the buildings were ordered completed by January 1, 1914. All architecture and ensembles of architecture were in the Spanish colonial or mission style. The horticultural features consisted of over 130 acres of trees, shrubs, and vines contained in hot houses, lath houses, and specially constructed gardens. The horticultural exhibit itself was to be contained in the largest conservatory ever built, in which efforts were to be made to show a specimen of every plant known. The scope of the exposition was to cover the world, but with particular reference to Mexico and Central and South America. Of special interest was to be the greatest and most complete Indian congress and ethnological exhibit ever arranged, representing every tribe of North and South America.

NASHVILLE. The first National Conservation Exposition was held in Knoxville, Tennessee, from September 1 to November 1, 1913. It had for its purpose the promotion of the highest development and best use of the natural resources of the country. There were eleven large exposition buildings and a number of smaller structures. The exhibits were divided into six general classes, namely: land, forests, water, wild animal life, minerals, and man. The exposition was formally opened by a wireless message from President Wilson, and other ceremonies.

NEW ORLEANS. A Southern States Exposition was in course of development to be opened in New Orleans, Louisiana, in the autumn of 1914. It was to be a permanent exposition of southern products, not only from the Southern States, but from all Latin-American countries, including Mexico and the Central and Southern American republics, and announced as its chief object to bind the countries of the western hemisphere in a closer commercial and social union. In 1913 plans and models were made, a site selected, and work begun on the grounds.

UNITED STATES. For the celebration of the one hundredth anniversary of peace among English-speaking peoples, a national committee was organized in the United States with Theodore Roosevelt as chairman and John A. Stewart as secretary, and a British committee with Earl Grey as president and H. S. Perris as secretary, together with local committees in all of the larger cities of the Union. The celebrations were to begin on December 24, 1914, the anniversary of the signing of the Treaty of Ghent, and continue during 1915, culminating in a series of international congresses opening in New York and ending at the Panama Exposition in San Francisco in 1915. These congresses were to have for their purpose the concentration of the peace sentiments of the world upon the specific accomplishments derived through the Third Hague Peace Conference, and with general reference to the peace, prosperity, and welfare of the peoples of the world. The special features of the platform proposed for perpetuation of peace included the following items: (1) International monuments, possibly of identical design. (2) Educational features to include the endowment of chairs of British-American history; prizes for essays in schools, colleges, and universities; a history of the Century of Peace from which text books and school books may be prepared; and an annual peace day celebration. (3) Universal commemorative tablets. (4) Universal religious services of thanksgiving, to be held on a day to be selected. (5) Permanent monuments. (6) The early appointment of a preparatory committee as recommended by The Hague Conference. (7) Celebration in Ghent, after consultation with the municipality. (8) An international commemorative medal. (9) An international committee to be appointed with power to deal with such matters as may be referred to them of the several countries concerned. (10) An appeal for cooperation.

PLATTSBURG. In connection with the celebration of the Century of Peace to be held during 1914-15, a State commission was appointed in New York to arrange for the celebration of the one hundredth anniversary of the battle of Plattsburg, where Commodore McDonough commanded the naval forces on Lake Champlain

that defeated the British fleet. Francis Lynde Stetson was chairman of the commission.

MANILA. The third annual carnival with an exposition of the agricultural, industrial, and commercial exhibits from the various provinces was held as usual in Manila during the first week in February (3-10), 1913. A similar exposition will be held in 1914.

GHEENT. A universal and international exhibition under the patronage of the king of the Belgians was held in Ghent, Belgium, from April until October, 1913. The grounds covered an area of about 250 acres and included the Citadel Park. The main buildings, which were large and imposing, comprised a palace of horticulture and of festivities, occupying a central site on the grounds, while the exhibits of the various industries were in a large palace, facing a wide avenue containing artistic fountains and flower-beds. The palace of fine arts was devoted to an international exhibit of paintings and sculptures and the important Congo exhibits were shown in the colonial section. Exhibits of Flemish agriculture were found in the "Village Moderne," where were also the more recent inventions in agricultural labor-saving machinery. "Old Flanders" was an artistic reproduction of the architecture and other picturesque characteristics of French, Belgian, and Dutch Flanders. The flower show, which was one of the most attractive features of the exhibition, was examined by a jury of 300 of the leading horticultural experts of the world. No fewer than sixty congresses were held in connection with the exhibition, and notably one of the Federated Societies of History and Archaeology, during the meeting of which a monument to Hubert Van Eyck was unveiled. Among the foreign nations that sent exhibits were Great Britain, including New Zealand and India, Germany, France, China, Japan, Argentina, Brazil, Chile, Cuba, and Peru. There was no official representation by the United States, although Congress made an appropriation of \$25,000 to encourage American exhibitors whose products were shown at Ghent. In comparison with the recent exhibitions in Liège in 1905 and in Brussels in 1910, that at Ghent was larger.

Among the foreign expositions announced to take place were:

LONDON. An Anglo-American exposition was to be held beginning October, 1914, in Shepard's Bush, London, under the direction of Imre Károlyi, to celebrate the century of peace, and the progress of the arts, sciences, and industries of the United States and the British Empire. The Duke of Connaught was to be patron and the Duke of Teck was to be president. Among the vice-presidents for America were Nicholas M. Butler, Joseph H. Choate, and Abbott L. Lowell. The general committee was to include 19 senators, 170 representatives, 38 governors, 45 mayors, 65 representatives of commercial bodies, and others. At the close of the exposition it was proposed to send the British exhibits *en masse* to the Panama-Pacific Exposition to be held in San Francisco during 1915.

PANAMA. The four hundredth anniversary of the discovery of the Pacific Ocean by Balboa was to be celebrated in Panama City by an exposition to be held from January 21 to May 31, 1914.

MISCELLANEOUS. Other important gatherings during the year were: Leipzig Building and

Trades Exposition held in Leipzig, Germany; First International Cinematograph Exhibition held in London; All-Russia Exhibition of Artisans and Industrial Concerns held in Moscow; Exposition of the National Wealth of Uruguay held in Montevideo in February; International Exhibition held in Elizabethville, Katanga, Belgian Congo, from April 8 to 30; International Congress of Agriculture held in Ghent from June 8 to 13; International Congress of Agricultural Women held in Ghent from June 13 to 15; International Congress of Home Training held in Ghent from June 15 to 17; Seventeenth International Congress of Medicine held in London from August 5 to 12; National and International Agricultural Exhibition held in The Hague from September 3 to 15; International Exhibition of Industrial Motors held in Parma, Italy, from June to October; and Exposition of International Hygiene held in Lima, Peru, from November 2 to December 31.

EXPRESS COMPANIES. See **PARCEL POST.**

FABIAN SOCIETY. See **SOCIALISM, Great Britain.**

FACTORY INVESTIGATING COMMISSION OF NEW YORK. This commission was created by the State legislature of 1911 and continued by that of 1912. Its chairman was Senator Robert F. Wagner; and its members included members of the State Assembly, Samuel Gompers, president of the American Federation of Labor; Mary E. Drier, president of the Women's Trade Union League of New York, and Abram I. Elkus, who acted as chief counsel. The work of this commission was very extensive and many of its findings little short of startling. This was especially true of its investigations into the fire hazards of factories throughout the State, the employment of children in up-State canneries, and in city tenements, and the night-work of women. It concluded its labors by recommending thirty-two bills to the legislature.

The most important of these bills provided for the reorganization of the State Department of Labor and for the creation of an industrial board. The commission held that labor legislation is of little value unless adequate governmental machinery is provided to enforce it; that the State Department of Labor, charged with protecting the health and safety of 1,500,000 workers in 45,000 establishments, had failed completely in its most important function of promoting an improvement of conditions; that ineffectiveness of administration has been due largely to the detailed and rigid character of laws depriving the department of all discretion. It advocated the European plan of broad and general statutes to be applied by administrative boards with power to make rules and regulations. Its bill therefore provided for an industrial board of five persons, including the commissioner of labor as chairman, with authority to formulate an industrial code, and rules and regulations supplementary to the statutes. These moreover could be different for different industries. The definite location of official responsibility was to be achieved by making the commissioner, with salary of \$8000, alone responsible for the enforcement of all laws and rules. The first deputy commissioner, with salary of \$5000, was to have charge of the bureau of inspection with its four divisions—factory,

home work, mercantile, and industrial hygiene. The State was to be divided into two districts, each under a chief, with salary of \$4000; and not fewer than 125 inspectors were to be provided, their salaries to range from \$1200 to \$3500, according to grade. There were to be seven grades, including factory inspectors *per se* of three grades, investigators, supervising inspectors speaking five foreign languages, medical inspectors, and finally the experts constituting the division of industrial hygiene. Special attention was required of inspectors as to the physical examination and medical supervision of children. Moreover, by other bills medical inspection of all persons engaged in dangerous trades was authorized. The newest feature of the bureau of inspection was the division of industrial hygiene. This was to be composed of expert advisers and investigators under the direction of a physician as chief medical inspector at a salary of \$4000; it must include also, at salaries of \$3500, a chemical engineer, a mechanical engineer with expert knowledge of ventilation and accident prevention, and a civil engineer expert in building construction and fire prevention. The division of home-work inspection was also newly created and was deemed one of the most important on account of the great extent and the special difficulties impeding effective control of work in city tenements.

In addition to the bureau of inspection the commission would retain in the Labor Department the bureau of mediation and arbitration, and the bureau of industries and immigration; and it would expand the bureau of statistics into the bureau of statistics and information. This latter bureau would have divisions of industrial directory, industrial accidents and diseases, investigations, and printing and publications.

One of the most important subjects dealt with by the commission was home-work in city tenements. Its findings were fairly astonishing even to well-informed persons. They showed that home work is a serious blot on our industrial system; that all ordinary rules of health and sanitation are repeatedly violated; that the spread of contagious disease by home-work products is an ever-present menace; and that child labor and compulsory education laws are nullified by the employment of children in hundreds of scattered home work-shops. The commission was not optimistic as to the possibility of regulating home work by inspection and supervision, and pointed definitely to the possibility of more radical action in the future. It said that if proposed measures failed, "then all manufacturing in tenement houses should be prohibited in the interest of the home workers, of the dwellers in tenement houses, and of the public at large." In its bills the commission provided for the immediate prohibition of the manufacture of food products, children's and infants' wearing apparel, and of dolls and dolls' clothing. These prohibitions were based on grounds of public health, especially the liability of children to contagion, the object being to avoid the objection of unconstitutionality.

Five of the bills dealt with fire prevention. The commission's own inquiries had confirmed the judgment of other expert investigators that there were scores of thousands of employees in

the State in serious danger of such catastrophes as the Asch building fire of 1911, and the Binghamton fire of 1913. The commission laid down two principles: (1) Every effort should be made to make fire impossible; (2) every employee should have adequate opportunity to escape in case of fire. Its bills therefore required numerous preventive measures, as the prohibition of smoking, fireproof storage for inflammable materials, guarding of gas-jets, fireproof enclosures for vertical openings between floors, and the installation of automatic sprinklers in buildings over seven stories in height. At the same time it was provided that the number of employees on any floor must be limited to the number that can safely escape therefrom; that stairways be straight and not less than 44 inches wide; that exits be specially safeguarded, and that fire alarm drills be instituted in all factories. Although these five bills covered a multitude of points, the industrial board was given power to amend and amplify as expert knowledge warranted.

Four bills related to the canneries, in which very deplorable conditions had been found. One of these bills was designed to prevent the further employment of children in sheds where fruits and vegetables are prepared for canning, such employment having been made possible by a ruling of a former attorney-general that such sheds did not come under the factory laws. The second limited the hours of women in canneries to 60 per week, but with the provision that the industrial board may permit any factory maintaining high-grade working conditions to employ women more than 60 hours per week. The third bill made it a crime to falsify factory time books. The fourth gave the Labor Department power to require factory labor camps to be so maintained as to provide adequate family privacy, and healthful sanitation.

The commission inquired also into the subject of industrial accidents. It found that in one year 51,000 accidents were reported to the Department of Labor from factories alone, and that 167 of these had been fatal. Its findings included many cases of indifference on the part of employers and carelessness on the part of workers. So also with reference to occupational poisonings and diseases. In some factories making paris green, carbonate of lead, lead batteries, and similar products, little or no precautions were found to protect the workers and the latter were found working with bare hands and without respirators. As a result, the commission discovered many cases of acute and chronic lead poisoning. In foundries and chemical factories workers were found exposed now to almost intolerable heat and now to sudden drafts, thus being predisposed to consumption. The commission would remedy such conditions not only by the rulings of the industrial board, but by a systematic campaign of education by means of lectures and bulletins. See also CHILD LABOR and SWEATING.

FAILURES, BUSINESS. See FINANCIAL REVIEW.

FALKLAND ISLANDS. A group of south Atlantic islands. A British colony. East Falkland has an area of 3000 square miles; West Falkland, 2300; there are besides about 100 smaller islands totaling 1200 square miles. Population in 1911, including the dependency of South Georgia, 3275. The entire acreage

is devoted to sheep grazing. At the end of 1911 there were 711,367 sheep, 7800 cattle, 3500 horses, 60 swine. The whaling industry in the dependencies was productive in 1911 of about 238,490 barrels of oil. Imports 1911, £93,913 (£94,294 in 1910); exports, £471,156 (£308,930). Shipping entered and cleared, 315,278 tons. Revenue 1911, £35,349 (£26,773 in 1910); expenditure, £22,460 (£17,405). Stanley (905 inhabitants) is the only town. South Georgia, the South Shetlands, Graham's Land, the South Orkneys, and the Sandwich group are dependencies. The colony is self-supporting, and has no debt. Governor, 1913, W. L. Allardye, appointed 1909.

FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA.

An organization which held its first meeting in Philadelphia in 1908, and was largely the culmination of previous voluntary federative movements, the chief of which had been the Evangelical Alliance and the National Federation of Churches and Christian Workers. The important preliminary work leading up to the organization was accomplished by the Interchurch Conference on Federation, held in New York City in 1905—a body composed of official delegates of thirty denominations, convened through the initiative of the National Federation of Churches and Christian Workers. This conference adopted the constitution of the Federal Council, and transmitted it to the various denominations with the understanding that approval of two-thirds of them would give it full effect. This approval was secured early in 1908. The work undertaken by the council is indicated by the titles of its commissions. These are as follows: State and local federations, foreign missions, home missions, religious education, social service, evangelism, family life, Sunday observance, temperance, and peace and arbitration. One of the important results of the work during the first four years has been the development of a more intimate acquaintance and a better understanding between the great bodies in the council, through working together and through the larger view which each has gained of the other's work by means of this mutual relation. The second quadrennial meeting of the council was held in Chicago, Ill., in December, 1912. Among the subjects upon which reports have been made by the various commissions are the following: "The Country Church," by Charles O. Gill and Gifford Pinchot; "Continuous Toil and Continuous Toilers," Rev. C. S. Macfarland; and "The Church and Modern Industry." Reports have been made also on industrial subjects in several communities. The council in 1913 undertook the compilation of religious statistics under the supervision of Dr. H. K. Carroll. (See RELIGIOUS DENOMINATIONS.)

The denominations affiliated with the Federal Council are as follows: The Baptist Churches (North), the National Baptist Convention (colored), the Free Baptist Churches, the Christian Church, the Congregational Churches, the Disciples of Christ, the Friends, the German Evangelical Synod (the Evangelical Association), the Evangelical Lutheran Church (General Synod), the Mennonite Church, the Methodist Episcopal Church, the Methodist Episcopal Church (South), the African M. E. Church, the African M. E. Zion Church, the Colored M. E. Church in

America, the Methodist Protestant Church, the Moravian Church, the Presbyterian Church in the U. S. A., the Presbyterian Church in U. S. (South), the Primitive Methodist Church, the Protestant Episcopal Church, the Reformed Church in America, the Reformed Church in United States, the Reformed Episcopal Church, the Reformed Presbyterian Church (General Synod), the Seventh Day Baptist Church, the United Brethren Church, the United Evangelical Church, the United Presbyterian Church, and the Welsh Presbyterian Church. The national office is in New York City.

FEDERATED MALAY STATES, THE. A British Malaysian protectorate composed of four states, as follows:

	Area Sq. m.	Pop. 1911	Imps.* 1911	Exps.* 1911
Perak	7,800	494,057	29,349,243	55,535,590
Selangor	3,156	294,035	30,196,834	47,433,952
Negri Sembilan	2,550	130,199	4,708,194	8,420,746
Pahang	14,000	118,708	2,277,768	4,890,639
Total.....	27,506	1,036,999	66,532,039	116,280,927

* In Straits Settlements dollars (1 SS \$= \$0.56776).

Length of railways operated by the Federated Malay States railways in the Straits Settlements and the Federated Malay States, 559 miles, with 120½ additional miles in the state of Johore. The main line extends from Prai (on the mainland opposite Penang) to Johore Bharu (opposite Singapore). Connection is made by ferry at each end. There are branch lines to Port Weld, Teluk Anson, Tronoh Mines, Batu Caves, Port Swettenham, Port Dickson, Kuala Pilah, Malacca, Triang, and Semantan. The East Coast Railway, connecting with the Siam railways near Kota Bharu, had reached Tembling, and its extension was still in progress, while the West Coast line was completed to the frontier at Perlis. The Pandanga-Baru line was open to Rapur, and a new line through the province of Wellesley and Kedah to the river Munda was under construction. The government had purchased the Singapore Railway and a small railway from Penang Town to Penang Hills was being made. Tin and rubber are the principal sources of wealth. Some gold is mined. Agricultural products include rice, gambier, pepper, coconuts, etc. Total revenue (1911), 35,056,544 dollars; expenditures, 25,202,749 dollars. The capital is Kuala Lumpur. High commissioner, (1913), Sir Arthur Young. See articles on the separate states.

FEDERATION OF LABOR, AMERICAN. See LABOR, AMERICAN FEDERATION OF.

FEMINISM. This term, originally French and only recently adopted into English, is applied to the theories that animate and support the movement of woman toward freedom, personal, political, and economic, and impel her to seek the opportunity for development and the full exercise of faculties in every field of human activity. From this point of view feminism may be regarded merely as humanism, which is being extended more slowly and with greater difficulty to women than to men, on account of the limitations imposed by tradition, customary habits of thought, and social institutions inherited from the past. Women in their struggle for freedom are confronted with all the

hindrances which men in a similar position had to conquer, and in addition to this, they find in their path a vast number of special obstacles which are due not only to prejudice but to the inherent difficulties of their situation, their physical disabilities, temporary or permanent, the burden of child-bearing and -rearing, and a social system in the formation of which little thought was taken toward adapting it to the free activity of women as well as of men.

Although feminism as the individual aspiration toward greater freedom and development for women has found expression in all periods of history, it is only in the last two centuries that it has assumed the character of an organized movement, inspired by a democratic ideal and supported by a body of social theory. The feminism of to-day has its roots in the democratic awakening which was inspired by the writings of Locke, Voltaire, Rousseau, and other philosophers of the eighteenth century, who elevated the ideas of rationalism, individual liberty, and the brotherhood of man, and dethroned the old shiboleths of tradition, authority, and social inequality. Humanism, or the discovery of man as man, found its first free and full expression in these philosophers. And it was inevitable that the same theory would by its own logic sooner or later be extended to women. Not less important, however, for the emancipation of women than this spiritual change, was the economic transformation of society at the end of the eighteenth century through the introduction of machinery, the consequent development of the factory system, the introduction of steam and electric power, and of means of rapid communication, steamboats, railways, telegraphs. Through this industrial revolution women were taken out of the home and used in vast numbers in factories, shops, and stores, while the woman in the home surrendered most of the productive and economic functions that she had hitherto exercised to the new forces of factory production. Gradually a new economic world has developed for both men and women outside of the home, and has made them loose economic units bound less closely by tradition and social ties; while those women who have remained in the home begin to feel the lack of occupation and the parasitic position to which this new economic order has reduced them. Such is the feminism of to-day, drawing its strength mainly from these two sources, the liberalism of the eighteenth century and the economic philosophy of the nineteenth, and combining them into a new social philosophy which demands freer opportunity for all human beings as such, the fullest possible expression for the powers of the individual, and the social functioning of his faculties in their highest efficiency.

The feminist movement has often, though erroneously, been identified with the Socialist movement. The latter is based on the idea of a struggle of economically exploited classes for economic justice, whereas feminism includes many other currents, political, social, and cultural, as well as economic, and is a sex rather than a class phenomenon. In the case of the overworked and underpaid workingwoman, however, the economic question is of prime importance, and the Socialist, rather than the feminist, movement, the solvent. The feminist movement is not at present a well-organized movement as a whole, like certain other great

social movements, but it finds expression in many kinds of organized and unorganized effort which are working for various practical reforms, especially for women, and with the same ultimate end in view—full freedom of expression and development for both sexes.

THE UNITED STATES. Feminists here have concentrated their attention on the attainment of the suffrage, and with great success (see WOMAN SUFFRAGE). They have already secured many of the things which European feminists are still striving for: full educational opportunities, admission to the bar in almost all States, permission to practice medicine, a fair approach to equality before the law in most States, and wide economic opportunities, the majority of gainful occupations being open to women. Outside of the suffrage, therefore, their demands have recently concentrated around the still further widening of economic opportunity, the abolition of all sex distinctions in economic and professional life, equal pay for equal work, higher professional training, and the right of women to a profession as well as to wifehood and motherhood. On this last point the struggle with the New York board of education over the right of married women and mothers to teach was highly significant. Two teachers who married were dismissed after the birth of children, and, in the case of Mrs. Peixotto, which was made a test case before the Supreme Court of the State, the appeal for reinstatement met with an adverse decision. An inquiry was made by the board of education into the efficiency of married teachers in general, with favorable results for the married teachers. A society called the League for the Civic Service of Women was formed in February, 1913, to arouse public opinion on the question, and mass-meetings were held. A Women's Civil Service League has also been formed to advocate equality of opportunity in the civil service for women and men. In several cities a movement is on foot for the appointment of women to the police force, and a struggle has taken place in New York City for the appointment of women as fire inspectors. The bureau of social hygiene, established in the winter of 1911, under the chairmanship of John D. Rockefeller, Jr., has issued two volumes of a series on modern prostitution. An extraordinary wave of interest in this question spread over the country during 1913. The success, financial as well as moral, of the production of Brieux's *Damaged Goods* was the prelude to a large number of other plays and moving-picture films dealing with the white slave traffic. General interest has also been aroused for the proposal of the teaching of sex hygiene to children in the schools, although it has met with violent opposition where—as in Chicago, for instance—attempts were made to put it into practical operation.

GREAT BRITAIN. The suffrage agitation has here, also, attracted the energy of most feminists. The report of the royal commission on divorce, two members of which were women, Lady Frances Balfour and Mrs. H. J. Tennent, recommended that the present privileged position of the husband in the divorce court should be abolished, and that adultery should be a sufficient cause for divorce in both cases. Further, the number of causes was recommended to be increased, and to include, in addition to adultery, desertion, cruelty, hopeless insanity, in-

curable drunkenness, and imprisonment under a commuted death sentence. Finally a less costly method of divorce than the present one was urged. England also was affected by the wave of indignation over revelations with regard to the white slave traffic.

In England, as in the United States, the teaching profession shows the decided tendency to fall into the hands of women. Women are also university professors, but are not yet admitted to theological schools nor to the bar, though they may study law and take the examinations. In January, 1913, by an overwhelming majority, the council of the English bar rejected a proposal to admit women to the bar. English women are not yet granted degrees, although they are allowed to study and take the higher examinations at the old universities of Oxford and Cambridge. In the newer universities in the cities they are admitted on the same basis as men. They have been admitted to the medical profession after a heated struggle. In this field the last year was marked by the founding of the South-London Hospital for Women, erected at a cost of \$200,000, and "manned" and managed entirely by women. Two women now sit on the royal commission to inquire into civil service appointments. Women are very widely employed as factory inspectors, inspectors of schools and prisons, probation officers, and in various offices under the local government board and other public bodies. Among working women Miss Mary McArthur, secretary of the Women's Trade Union League, reports 300,000 organized working girls out of a total of five million of women and girls engaged in industrial occupations. Women do not benefit by a minimum-wage provision as do miners among men, though they are somewhat protected in the sweated trades; and they do not benefit by the fair-wages clause in the municipal service. The position of the English woman before the law is still very unequal. The feminist is demanding equal rights of the mother over her children, economic independence of the married woman, the raising of the age of consent above 16, and legal equality of sexes in inheritance and legal contracts.

GERMANY. The suffrage movement has been of less importance in Germany because of peculiar political conditions. The Socialist movement has attracted much of the energy of the feminists. Outside these two fields feminism has taken the form of a general economic advance. In municipal offices, such as poor relief, care of orphans, housing inspection, school administration, the number of women employed has grown from 12,000 to 19,000 in the interval 1910 to 1913. This public service demands a special training, which is now supplied by social women's schools organized by women. The economic demand for women's labor is increasing every year, and also the number of married working women. The large figures of the last census are far exceeded by those of the last year. Vocational training for the girls of the lower classes was promoted in this year by the general operation of the obligatory industrial continuation schools for girls. The government memorandum on the subject lays down the principle that the education of the female working population must be taken as systematically in hand as that of the male. In the handicrafts the position of women has been improved by the opening of public training and investi-

gation. Accompanying this increased industrial activity, there has been a decline in the birth-rate which has created anxiety in some quarters. A woman's bank has been established exclusively for women, with a capital of about a million marks, and the avowed intention of strengthening the financial influence of women.

FRANCE. In France, original home of the feminist movement, the religious and social influences have restricted the advance of women. French women are active in business, have always had good educational opportunities, and have entered most occupations. The decoration of the Legion of Honor was conferred on several women, including Madame Sarah Bernhardt. Madame Curie, the discoverer of radium, holds the chair of physics at the Sorbonne. Feminists in France have now to struggle against state-regulated prostitution and the low legal position of women, although they were recently given full right to their own earnings, free from the control of the father for their children, legitimate or illegitimate.

OTHER COUNTRIES. In addition to the political gains made in Denmark and Norway, the women of the latter country have secured equal pay with men in the postal service. In the Slavonic countries, Bulgaria, Serbia, and Rumania, the position of women is influenced by Mohammedan ideas, and the movement for their emancipation is working with the Socialist movement. In Serbia, however, the women's club movement is widely spread and now includes 20,000 members. The condition of the working women in these countries is very bad. In Turkey a period of reaction has set in after the temporary freedom accorded to women at the time of the revolution, when they walked about without the veil and held public meetings. But the progressive women are not ceasing their efforts. In 1913 a new women's paper was established, the first in Turkey. In Japan the women are in no position of equality with the men, though they are engaged in industry in even greater numbers than men. Women have educational opportunities and are admitted to the practice of medicine and pharmacy. There are many Japanese women authors. Recently a new women's society was founded—the Society of the Truly New Women—in addition to two already existing similar organizations.

In China during the revolution the women formed "dare to die clubs"; smuggled in ammunition; fought the soldiers; and mounted the scaffold. The revolutionary clubs were later converted into suffrage clubs. The awakening of women in China to social and political interests has been indeed astonishing.

FENCING. The twentieth annual intercollegiate fencing tournament was won by Columbia. Cornell was second, and Pennsylvania third. The standing of the various teams entered was: Columbia won 27 bouts, lost 9; Cornell won 19, lost 17; Pennsylvania won 18, lost 18; U. S. Naval Academy won 16, lost 20; Harvard won 10, lost 26. In dual matches the U. S. Naval Academy defeated Columbia 5-4, and Pennsylvania 7-2. The U. S. Naval Academy was defeated by the New York Fencers' Club 2-7, and by Cornell 4-5. Columbia defeated Yale 5-4, Cornell 6-3, Pennsylvania 5-4, and Williams 7-2.

In the national championships held by the

American Fencers' League, P. J. Meylan of the Fencers' Club of New York, won with the foils, A. E. Sauer with the dueling swords, and A. G. Anderson of the New York A. C., with the sabres. The women's championship with the foils was won by Mrs. W. H. Dewar.

FERRIS. DR. ALBERT WARREN. See SARATOGA SPRINGS.

FERTILIZERS. It was reliably estimated that the world's consumption of commercial fertilizers by 1913 had reached a value of over \$400,000,000 per annum. The use of fertilizers was very uneven in different parts of the world, but it seemed quite clear that those countries having the most intensive agriculture used fertilizers most freely. Thus Belgium, which was especially noted for its intensive farming, used on the average over 178 pounds of fertilizer per acre of cultivated area; Germany and the Netherlands 89 to 178 pounds; Great Britain, France, Italy, Denmark, Switzerland, and Australia 45 to 89 pounds; Ireland, Austria, Hungary, Spain, Portugal, Norway, Sweden, Japan, New Zealand, Tunis, Algeria, and the Dutch East Indies 9 to 45 pounds. Other countries except the United States consumed less than 9 pounds. The consumption in the United States varied widely in different sections. It was largest in the Southern States, where it varied from 45 to 89 pounds per acre of cultivated area. In the Northwestern States it varied from 9 to 45 pounds per acre, while in the rest of the country it averaged less than 9 pounds per acre. An organized movement to increase the use of fertilizers in the western United States developed decided strength during the year 1913. This movement was fostered largely by fertilizer manufacturers and allied interests.

The International Agricultural Institute at Rome estimated that the world used in 1911, the latest year for which complete statistics are available for this YEAR BOOK, 5,668,000 metric tons (2204.6 pounds each) of natural phosphate (mainly in the manufacture of superphosphates), 9,604,000 tons of superphosphate, 3,263,000 tons of Thomas slag, 3,240,000 tons of potash salts (equal to pure potash 848,400 tons), 2,313,450 tons of sodium nitrate, 1,050,000 tons of ammonium sulphate and 100,000 tons of synthetic nitrogen compounds. The institute recorded data for production and consumption of chemical fertilizers in over 60 different countries, including not only all the leading countries of the world agriculturally, but also a large proportion of those in which agriculture was less advanced. The most rapid advances in the use of fertilizers were recorded in some of the countries which had adopted the practice of applying commercial fertilizers at a comparatively recent date. Thus, Japan, which only a few years before had depended largely upon fish fertilizers, oil cakes, green manures, night soil, and various wastes and by-products to maintain the fertility of the soil, was reported to be using fertilizers to the value of \$40,000,000 annually. Japan had become not only a large importer of fertilizing materials, particularly superphosphates, sodium nitrate, and ammonium sulphate, but was also rapidly developing a domestic fertilizer industry. Other countries which showed especially rapid increase in the use of fertilizers were Spain, Portugal, Italy, Russia, Tunis, Algeria, Australia, New Zealand, Chile, Uruguay, and Argentina. The

Central and South American states as a rule used small amounts of fertilizers.

NITROGEN. The Chilean nitrate deposits continued to be the chief source of nitrogen in fertilizers. Despite alarming reports to the contrary it seemed quite certain from recent careful surveys of the situation that these deposits were capable of supplying the needs of the world for many decades to come. The representative of the Chilean nitrate interests in the United States asserted that "there are probably, in round numbers, 1,000,000,000 tons of nitrate in the deposits of Chile, and, without doubt, large supplies also exist on lands but incompletely prospected. The surveyed and certified tonnage opened up at the present time ready for extracting is fully 250,000,000 tons." Nevertheless, the manufacture of synthetic nitrogen compounds from the air was being developed with unabated activity, although reliable statistics of the production of these compounds were difficult to obtain.

The production of cyanamid in 1913 was estimated at 225,000 tons, consumed in the main as follows: United States 48,000 tons, Norway and Sweden 60,000 tons, Germany 40,000 tons, Italy 30,000 tons, Switzerland 10,000 tons, France and Japan 7500 tons each. Factories or the manufacture of cyanamid were in operation in Norway, Sweden, Italy, Switzerland, Germany, France, Japan, and Canada, and others were projected. The American factory (Niagara Falls, Ontario) when completed was to have a capacity of 50,000 tons per annum. The use of cyanamid in mixed fertilizers was increasing, although it had been found that it must be used with caution for this purpose since in mixtures with superphosphate it reduced the availability of the phosphoric acid.

The production of calcium nitrate, which was made principally at Notodden, Norway, was estimated at 140,000 metric tons for 1910. A recent development of this industry was the conversion of calcium nitrate into sodium and ammonium nitrates for agricultural purposes. Commercial application of processes for the manufacture of synthetic ammonia was also being made and the aluminum nitrid process was perfected but not tried on a commercial scale.

The increase in the production and consumption of ammonium sulphate continued unabated. The world's output in 1912 was: Germany, 465,000 metric tons; United Kingdom, 379,000 tons; United States, 155,000 tons; France, 68,500 tons; Belgium, 49,500 tons; other countries, 170,000 tons; making a total of 1,287,000 tons. The consumption in the United States was 215,000 tons. Germany's continued supremacy in production was attributed to the increasing use of by-products of coke ovens and producer gas plants in that country.

Few probably realized the extent and possibilities of the use of fish fertilizers. A recent consular and trade report showed that from 60,000 to 70,000 tons of fish fertilizer was produced on the Atlantic and Gulf coasts of the United States and about 3000 tons on the Pacific Coast, largely (about three-fifths) in Alaska. The Pacific Coast product was mainly used in Hawaii. A considerable amount of fish scrap was imported into the United States from Norway.

Slaughterhouse refuse (tankage and dried blood) was another important source of nitro-

genous fertilizer. It was estimated that the production of tankage in the United States in 1912 was about 100,000 tons, of dried blood 37,700 tons. In this case as in that of the fish fertilizer there was a very large waste which might have been profitably utilized.

PHOSPHATES. The world's production of phosphate in 1912 was about 6,000,000 metric tons, the principal producers being the United States, 2,973,332 long tons; Tunisia, 1,650,000 metric tons; Algeria, 380,000 metric tons; France, 300,000 metric tons; Christmas, Ocean, and Nauru islands, 450,000 metric tons; and Belgium, 120,000 metric tons. There was an increase in the phosphate mined in the United States, but a slight decrease in that marketed in 1912 as compared with the previous year. Florida produced 81 per cent. of the entire output of the United States, Tennessee 14.2 per cent. The United States exported 1,206,520 long tons of phosphate in 1912. Since the beginning of phosphate mining in South Carolina, in 1867, the marketed output of the United States had been 42,600,000 long tons, valued at \$174,000,000. The imports of phosphatic materials by the United States in 1912 included bone dust, bone charcoal, bone ash, etc., 117,717 long tons, crude phosphate 28,821 tons, phosphatic slag 12,596 tons, besides small amounts of apatite and phosphatic guanos. See **PHOSPHATE ROCK**.

The world's production of Thomas (phosphatic) slag now exceeds 3,500,000 tons, two-thirds of the total output being produced in Germany. Although there was recently a considerable increase in the direct use of fine-ground crude phosphate as a fertilizer, by far the greater part of the output was still converted into superphosphate. There was a notable development of manufacture of superphosphate during the past year in Russia, Japan, Tunis, and Algeria.

POTASH. Notwithstanding the very active search in the United States and in Europe for other commercial sources of potash, none had yet been found which seriously menaced the supremacy of the German potash deposits. Further exploitations recently made but tended to confirm the former view that these deposits were practically inexhaustible. The sinking of potash mines in Germany rapidly increased despite the potash law, which was designed to limit and control the output. The number of mines increased from 50 to about 300 since the law went into effect. The product mined in 1912 was stated to have been worth about \$15,000,000, and was probably increased \$3,500,000 in 1913. The guaranteeing of a production quota at a fixed price, as was done in the potash law, apparently had simply operated to rapidly increase the number of new mines at the expense of the business of the old.

The investigations of brines and salt deposits of the United States, which were actively continued during the year 1913, had not revealed any other supplies of great commercial significance. There was some development on a small scale of the extraction of potash salts from the Pacific Coast kelps and considerable study was made of the possibilities of utilizing alunite, feldspars, and other potash minerals as sources of potash. It was the opinion of those who had most carefully investigated the subject that such of these sources of potash as were already known to exist in the United States could be

exploited commercially at a profit and were capable of supplying the present and prospective needs of the country. It was maintained that a high-grade potassium chloride could be obtained from kelp with as little difficulty as from crude German potash salts, and at a cost that made extraction commercially practicable. The dried kelps of the Pacific Coast had been shown to contain from 20 to 35 per cent., or even more, of potassium chloride, and had been demonstrated to be very efficient fertilizers in this form.

LITERATURE. The most notable contributions to the literature of fertilizers during the year were: A bulletin of the International Institute of Agriculture at Rome, on the production and consumption of chemical fertilizer in the world; a book, *Farm Manures*, by C. E. Thorne, director of the Ohio Agricultural Experiment Station (New York, 1913); and another book, *Manures and Fertilizers* (New York, 1913), by H. J. Wheeler, formerly director of the Rhode Island Agricultural Experiment Station.

FICTION. See **FRENCH LITERATURE**; **GERMAN LITERATURE**; and **LITERATURE, ENGLISH AND AMERICAN**.

FIELD, STEPHEN DUDLEY. An American inventor, died May 18, 1913. He was born in Stockbridge, Mass., in 1846, and was the son of Jonathan Edward Fields, who was a brother of Cryus W. Field and David Dudley Field. He received an academic education. His interest from his earliest years had been in mechanics and in 1874 he invented the multiple call district telegraph box. Four years later he perfected the electric elevator, and in the year following built the first trolley car, capable of holding two people. The possibility of the trolley car as a means of transportation was not taken seriously at that time and when Mr. Field exhibited his trolley system at a business exposition in Chicago, it excited more amusement than interest. Ten years later, however, other inventors took up his ideas and began to invent improvements. Mr. Field sold his rights to the General Electric Company and the Westinghouse Company in 1896 to avoid the expense of litigation, as suits had been threatened by several persons in an effort to establish their claims to his invention. In 1880, soon after he had invented the trolley car, he made the first application of dynamo machines in telegraphy. Previous to this the electricity was stored in batteries which were cumbersome and expensive. In 1884 he invented the stock ticker. His last important invention was made in 1909. This was a cable quadruplex which permits four messages to be sent over a cable wire at the same time. Altogether he invented over 200 devices.

FIJI ISLANDS. A group of from 200 to 250 islands, rocks, and inlets in the south Pacific; a British crown colony. Including the dependency of Rotumah (14 square miles), the total area is 7435 square miles (Viti Levu, 4112; Vanua Levu, 2432; Taviuni, 217; Kadavu, 124; Koro, 58; Gau, 45; Ovalau, 43). Population (1911), 139,541 (80,008 males, 59,533 females); of whom 87,096 were Fijians, 40,286 Indians, 3707 Europeans, 2401 half-castes, 217 Rotumans; etc. Capital, Suva. Sugar, copra, and fruits are the chief products and exports. Exports of sugar in 1911, £797,274; copra, £294,245; fruits, £151,667. Total im-

ports in 1911, £957,079 (£870,120 in 1910); exports, £1,276,207 (£1,005,818). Revenue and expenditure in 1911, £240,395 (£211,952 in 1910) and £265,347 (£236,661). Shipping entered and cleared, 584,835 tons. Australia, New Zealand, and Canada receive the majority of the trade. Governor, 1913, Sir Ernest Bickham Sweet-Escott (July, 1912).

FILTRATION. See WATER PURIFICATION.

FINANCE. See sections so entitled under various countries, and under the States of the United States. See also FINANCIAL REVIEW.

FINANCIAL REVIEW. The following article gives a general summary of business conditions during the year. Other articles related to topics here discussed are the following: BANKS AND BANKING; NATIONAL BANKS; STATE BANKS; LOAN AND TRUST COMPANIES; SAVINGS BANKS; POSTAL SAVINGS BANKS; PRICES; TARIFF; TRUSTS; INSURANCE; AGRICULTURAL CREDIT. See also LABOR and various articles there referred to.

GENERAL CONDITIONS. Following the panic of 1907 there was slow recovery in 1908 and marked revival of trade in 1909, accompanied by decided increases in stock market values. In 1910 this improvement received a marked check, and the year 1911 was one of caution and restraint. In 1912, however, the crops were large, pig-iron production exceeded all previous records, steel prices advanced, the unfilled orders of the United States Steel Corporation rose from 5,084,000 tons in June to 7,932,000 tons on December 31, railroad earnings gained substantially both in gross and net, bank clearings and building operations showed great gains, foreign trade increased 16 per cent. over 1911, and during the first nine months security prices rose considerably.

The trade recession which brought on the decline of stock values in the fourth quarter of 1912 created a somewhat pessimistic business outlook, which prevailed during a large part of 1913. While it was not distinctly a year of depression, conditions were somewhat less favorable than in 1912, and it was not a year of genuine prosperity. The total output of pig iron was about 31,000,000 tons, or 4.5 per cent. greater than the previous maximum in 1912. Production during the later months, however, declined. In the steel industry a climax was reached toward the end of 1912, when the steel corporation was running at 95 per cent. of its capacity. During the year, however, its unfilled orders declined from the great maximum noted above to 4,396,000 tons, December 1. Moreover, prices declined from \$27.50 for steel billets in January to \$20.50 in November. In December, little more than a half of the full manufacturing capacity of the steel industry was employed. Thousands of men were out of work. Nevertheless the corporation's net earnings were very great. They had reached \$35,185,000 in the fourth quarter of 1912; they were \$34,428,000 in the first quarter of 1913; \$41,219,000 in the second quarter; and \$38,450,000 in the third quarter. The volume of railroad traffic was large, gross earnings increased 6 per cent. over 1912; but on account of increased costs of operation, especially increased wages (see ARBITRATION AND CONCILIATION, INDUSTRIAL), net earnings declined slightly. Foreign trade for the first eleven months showed a total of \$3,859,758,000,

or 1.23 per cent. over the same period in 1912. Exports were 4.76 greater while imports were 3.33 per cent. less than in 1911. The excess of exports amounted to \$642,100,000, or nearly one-third more than in the first eleven months of 1912. Bank clearings were somewhat smaller than in 1912, but this was explained entirely by the decline in speculation at New York. Commercial failures showed a very marked increase. National bank loans were slightly greater than in the preceding year. Building decreased in amount. Prices of securities declined, active stocks showing losses of more than 10 points, while standard bonds declined from two to five points. Immigration was greater than in any recent year.

BLUE-SKY LAWS. During 1913 a great many States, following the lead of Kansas in 1911, enacted what are known popularly as "blue-sky" laws. These are acts providing for the regulation and supervision of investment companies, or of the sale to the public of stocks and bonds of corporations. In Kansas the immediate cause of this legislation was the flotation of many fraudulent companies, claiming prospects and property in the oil and gas belt in the southeast corner of the State of Oklahoma. Other States have sought to protect innocent and unwary investors from gross deception by the attractive prospectuses and convincing agents of investment houses and corporations selling stocks and bonds of a fraudulent nature. The importance of such legislation was enforced by the statement of the Postmaster-General that in 1913 fully \$120,000,000 was secured from the public by fake investment schemes.

The following States have enacted such laws: Arizona, Arkansas, California, Idaho, Iowa, Kansas, Maine, Michigan, Missouri, Montana, Nebraska, North Dakota, Ohio, Oregon, South Dakota, Vermont, West Virginia, and Wisconsin. The Kansas act was amended in 1913. In North Carolina a law of somewhat similar character was enacted. In Colorado a bill was vetoed by the governor. New Hampshire created a commission to investigate the subject. Many other State legislatures considered "blue-sky" bills. The Investment Bankers' Association has been active in securing the enactment of such laws as would be fair to both security dealers and the investing public and at the same time not prevent the flotation of companies involving reasonable business risk.

In some cases the administration of the act is entrusted to a previously existing authority, as the State banking commissioner, but as a rule a new board or commission was created. Thus in Michigan and South Dakota there was created a "securities commission"; in Montana an "investment commissioner"; in Oregon, a "corporation department." As a rule these laws require dealers in securities to have a State license and to file with the State authority information regarding stocks, bonds, and other securities sold, including copies of circulars and advertisements used to advance their sale. Frequently such a dealer must furnish a bond as a guaranty of good faith. Corporations selling their own securities must furnish information circulars and advertisements regarding them. The information required by laws of the more severe Kansas type is full and detailed, while in others of the more mod-

erate Maine and Wisconsin type the information is of a more general nature. Punishment for violation is provided.

The constitutionality of the Arkansas, Iowa, Kansas, and Michigan acts was attacked. The Arkansas law was upheld by the State court, at least in so far as it applied to building and loan associations. In Iowa the case had not been advanced to decision. In Michigan the State court upheld the law and the case has been appealed to the Federal court. Following the attack of the Kansas act the author of the original law, former Bank Commissioner J. N. Dollie, formed the National Blue-Sky Protective Association to carry on legal defense of the statute. The arguments against such laws are that they deprive individuals of the right of freedom of contract, and that they delegate legislative power to administrative officials.

CROPS. The report of the Department of Agriculture issued in December showed that the aggregate value of farm products was nearly ten billion dollars, a value greater than in any preceding year. Of this sum \$5,847,000,000 was cash income and the remainder the value of crops and livestock remaining on farms. It was estimated that 52 per cent. of the crops and 20 per cent. of the animals raised would remain on farms. The value of cereals alone was \$2,896,000,000, corn being credited with \$1,692,000,000, wheat with \$810,000,000, and oats with \$440,000,000. The value of the cotton crops was \$798,000,000; hay, \$797,000,000; potatoes, \$228,000,000; sweet potatoes, \$43,000,000; tobacco, \$122,000,000; and sugar beets, \$34,000,000. The value of dairy products was estimated at \$814,000,000; of eggs and fowls at \$578,000,000, and of wool, \$51,000,000. The value of animals sold and slaughtered was placed at \$3,650,000,000.

The total crop acreage was about 300,000,000, or practically the same as in the immediately preceding years. The aggregate value, however, was 3.8 per cent. greater than in 1912, and 7.6 per cent. greater than in 1911. The greater value was due primarily to higher prices, it being true that a yield below normal was worth more than in any preceding year. Thus the corn crop was 678,000,000 bushels, or 21 per cent. smaller than in 1912, but was valued at 11 per cent. more. Cotton also, though smaller in quantity, was higher in value. The quantitative yield of the six leading cereals was 17.7 per cent. below 1912 while the value was 7 per cent. greater. In spite of high prices there were exported in the fiscal year 1913 agricultural products valued at \$1,123,000,000, an amount never before equaled, and ample proof that high food prices are not peculiar to the United States.

BANK CLEARINGS. By *Bradstreet's* reports the aggregate bank clearings of the year for the United States were \$168,054,465,000, or 2.5 per cent. less than in 1912. This was a gain, however, of 6.2 per cent. over 1911, of 3.7 per cent. over 1910, of 2.4 per cent. over 1909, and of 28 per cent. over 1908. Clearings at New York totaled \$94,634,281,000, an amount exceeded only in 1912, 1910, 1909, and 1906. That city's proportion of the country's total was 58.6 per cent., the smallest proportion since 1896. This was interpreted as due in part to the small volume of speculation at New York, and in part to the growing banking power of other

cities. The clearings outside of New York were the largest on record and were greater in all but three months than in the corresponding months of 1912. Their total exceeded that of 1912 by 2.5 per cent. and that of 1911 by 11 per cent.

Sixteen Canadian cities reported bank clearings aggregating \$9,060,320,000. This was slightly more than in 1912 and the greatest yet recorded.

STOCK MARKET. Dealings on the stock exchanges reflected the strain and absence of buoyancy in business. Total transactions on the New York exchange were the smallest in sixteen years, and new corporate securities issued were 27 per cent. less than in 1912. Important factors in this stagnation included the prolongation of the Balkan War and consequent fears of political and military conflict in Europe. There resulted hoarding and a scarcity of capital in the presence of increased borrowings in nearly all nations of the world. The Mexican situation, the financial unsettlement in South America, and silver speculation and bank failures in India were other disturbing factors. At home, while the volume of railway business was large, net earnings were seriously cut into by the demands of organized railway labor. See **ARBITRATION AND CONCILIATION, INDUSTRIAL.** Moreover the reduction in dividend from eight to six per cent. by the New Haven, the passing of the New Haven dividend in December, and the receivership for the Frisco system created a pessimistic feeling regarding railway shares. The early months of the year were marked by a great volume of liquidation by foreign holders of American securities. This led to the exportation of \$48,000,000 of gold in January and March, largely to Paris. The money market was helped by the tender of \$50,000,000 of government deposits to banks of the agricultural States in the early summer. The average price of 50 stocks reached a minimum of 63 on June 10, or 16 points below the highest average in January. In some cases stocks approached the low levels of 1907-1908. Then came a rally which lasted into September. During the fall there was little change except for new low levels reached by New Haven and declines by some others. There was a decided improvement in the last weeks of the year.

Total transactions on the New York exchange amounted to 83,467,176 shares of stock and \$501,514,520 par value of bonds. Stock transactions were the smallest since 1897 and 36 per cent. less than in 1912. Bond transactions were 26 per cent. less than in 1912 and bond prices declined, while new issues were made at higher rates. Thus New York City sold in May \$45,000,000 bonds bearing $4\frac{1}{2}$ per cent.; and railroads frequently resorted to short-term notes owing to the restricted bond market.

BUSINESS FAILURES. In number and volume, business failures were a good index of the prevailing conditions during the year. According to *Bradstreet's* the number of business failures was 14,553, a number not equaled since 1896, when the number was 15,094 and exceeded by only one other year, 1893. The total number in business who failed was .84 per cent. as compared with .82 per cent. in 1912, .77 in 1911, .72 in 1910, .76 in 1909, and .94 in 1908. The total was 15 per cent. greater than in 1911.

and 25.7 per cent. greater than in 1910. Aggregate liabilities were \$299,781,000 and total assets, \$159,368,000. The liabilities were 46 per cent. greater than in 1912; 55 per cent. greater than in 1910 and 1911; and 108 per cent. greater than in 1909; but they were 1.3 per cent. less than in 1908 and 23.6 per cent. less than in 1907. The only other year showing greater liabilities was 1893. Every group of States showed increases in liabilities as compared with 1912. New York City furnished more than one-half the total increase in the number, but showed a decrease in liabilities. New England, on the other hand, showed an increase of only 4.8 per cent. in number, but of 157 per cent. in liabilities. During the year about 375 large failures, including a considerable number of manufacturing concerns and several big banks, occurred.

In Canada the number of failures was 1826, or 40 per cent. more than in 1912. Their aggregate liabilities were \$16,629,000, or 35 per cent. more than in 1912. The liabilities had been exceeded only in 1883, 1884, 1887, 1894, and 1898.

FINLAND. A grand-duchy incorporated with the Russian Empire in September, 1809. The capital is Helsingfors.

AREA, POPULATION, ETC. The area, including internal waters, is 373,604 sq. kilometers, or 144,249 sq. miles. The population, December 31, 1911, numbered 3,154,824—1,567,709 males and 1,587,115 females. According to religion, the population was divided as follows: 3,096,263 evangelicals, 52,728 Orthodox Greeks, 4666 Baptists, etc.; according to language (1910): 2,578,145 speaking Finnish, 338,961 Swedish, 7339 Russian, 1794 German, 1659 Lapp, etc. Marriages in 1911 numbered 18,735, births, 93,629, deaths, 54,039. Helsingfors had (1911) 153,642 inhabitants, Åbo 50,994, Tammerfors 45,791, Viborg 27,769.

Education is conducted on a high plane, and primary instruction is free and compulsory. Secondary and special schools are well attended. There is a university at Helsingfors, with 2512 students (518 women).

PRODUCTION AND COMMERCE. The main crops are rye, barley, oats, and potatoes. Saw mills and paper factories are the important industrial enterprises; great quantities of timber are exported. Dairy produce is also an article of export.

Trade by countries of origin and destination and totals for 1911 and 1912 are given in the following table, values in thousands of marks (gold):

	Imps.	Exps.		Imps.	Exps.
Germany	186,800	48,200	France	7,500	23,200
Russia	131,100	98,400	Spain	2,300	9,400
U. K.	63,300	87,600	Other	7,000	6,600
Denmark	25,200	11,700			
Swe. & Nor.	28,000	15,100	1912	469,900	337,800
Neth., etc.	15,700	32,600	1911	444,500	319,600

The more important articles of import in 1912, with values in thousands of marks, were cereals, 87,300; machinery, 28,000; iron and iron wares, 25,400; coffee, 24,400; ores, 20,000; sugar, 19,900; skins and leather, 18,900; cotton, 16,100; chemicals and dyes, 12,800; tobacco, 8400; cotton textiles, 8000; yarns, 8000; wine, 6300; petroleum, 6300; apparel, 5800; meats, 5400. The chief exports were timber,

166,200; paper and wood-pulp, 64,100; butter, 34,900; skins and leather, 12,600; wooden wares, 7200; fish, 5500; cotton textiles, 4800; iron, 1500. There entered at the ports, in 1912, 10,020 vessels of 2,929,793 tons. The merchant marine included, January 1, 1913, 3425 vessels, of 392,408 tons.

There were in operation in January, 1913, 3763 kilometers of railway line. Post offices, 2213.

FINANCE. For the year 1911, the revenue amounted to 159,421,716 marks and the expenditure to 159,956,052 marks. Revenue 1912, 172,344,012 marks, derived as follows: 72,707,339 marks from state domains and forests, railways, canals, etc.; 70,597,847 from indirect taxes; 7,891,181 from posts; 6,516,592 from direct taxes and other ordinary; extraordinary, 1,027,784. Expenditure, 1912, 166,262,020 marks, distributed as follows: 48,535,157 marks for communications, 16,187,325 for worship and instruction, 14,303,227 for civil administration, 13,160,761 military contribution to the Russian treasury, 8,474,149 debt charge, 7,469,332 for agriculture, etc., 7,193,113 for commerce and industry, 3,025,170 for justice and prisons; and other ordinary; extraordinary, 20,854,045. The public debt stood, January 1, 1913, at 174,640,334 marks.

GOVERNMENT. The Russian sovereign is the grand duke. He is represented by a resident governor-general (Lieut.-Gen. F. A. Seyn in 1913); the secretary of state (1913, Lieut.-Gen. W. Markov) resides at St. Petersburg. The Diet has 200 members, elected by universal suffrage for three years and nominally possesses large powers; actually it is little more than a figure-head. Under the present régime little of her guaranteed autonomy is left to Finland.

HISTORY. The Russification of Finland was thoroughly discussed in the 1912 YEAR BOOK. For developments of the policy during 1913, see *RUSSIA, History*.

FINLEY, WILLIAM WILSON. An American railway official, died November 25, 1913. Born in 1853 at Pass Christian, Miss., he began at the age of twenty his work in the railroad business, as stenographer to the vice-president of the New Orleans, Jackson, and Great Northern Railway. He was promoted by successive steps, and on various roads, becoming, in 1892, general traffic manager of the Great Northern and Montana Central road, serving until 1895. In the latter year he was appointed commissioner of the Southern States Passenger Association, and served for several months as third vice-president of the Southern Railway, and as second vice-president of the Great Northern Railway. In 1896 he was appointed second-vice-president of the Southern Railway, and in 1906 president. He was also president of the Mobile and Ohio Railroad, the Southern Railway in Mississippi, the Alabama Great Southern Railroad, the Cincinnati, New Orleans, and Texas Pacific Railway, the Georgia, Southern, and Florida Railway, the Virginia and Southwestern Railway, and the Northern Alabama Railway. In 1910 he received the degree of LL.D. from Tulane University. In the same year the University of Kentucky conferred upon him the same degree.

FIRE BOATS. See *FIRE PROTECTION, Progress*.

FIRE DRILLS. See *FIRE PROTECTION*.

FIRE PREVENTION. See FIRE PROTECTION.

FIRE PROTECTION. The accompanying tables, giving the statistics of fires in the United States, and in the principal foreign cities during the year 1912, have been compiled from the report of the committee on statistics and origin of fires of the National Board of Underwriters. These figures are of unusual interest and show that the United States and Canada with *per capita* losses by fire of \$2.55 and \$2.88 respectively in 1912 are far behind other great countries of the world, England showing a *per capita* of 54 cents, France of 84 cents, Germany of 20 cents, and Russia of 90 cents.

COMPARATIVE FIRE LOSSES

Country	Number of Cities Reporting Loss		Population		Per Capita Loss	
	1911	1912	1911	1912	1911	1912

† Figures for 1911.

The fire losses in the United States and Canada during the thirty-seven years ended with 1913 aggregated \$5,631,389,675, or an annual average of \$152,199,721. The accompanying table, giving the losses by years during the years 1877-1913, shows the steady general upward tendency of the country's fire waste. It will be noted that since 1906, the year of the San Francisco conflagration, the annual fire loss has stood at well above two hundred million dollars:

1913	\$224,723,350	1894	\$128,246,405
1912	225,320,900	1893	156,445,875
1911	234,337,250	1892	151,516,000
1910	234,470,650	1891	143,764,000
1909	203,649,200	1890	108,993,700
1908	238,562,250	1889	123,046,800
1907	215,671,250	1888	110,885,600
1906	459,710,000	1887	120,283,000
1905	175,193,800	1886	104,924,700
1904	252,554,050	1885	102,818,700
1903	156,195,700	1884	110,008,600
1902	149,260,850	1883	110,149,000
1901	164,347,450	1882	84,505,000
1900	163,362,250	1881	81,280,000
1899	136,773,200	1880	74,643,400
1898	119,650,500	1879	77,703,700
1897	110,319,650	1878	34,315,900
1896	115,655,500	1877	68,265,800
1895	129,835,700		

Total for 37 years.....\$5,631,389,675

AMERICAN FIRE LOSSES IN 1913. The losses by fire in the United States and Canada during 1913, as recorded by the *Journal of Commerce and Commercial Bulletin*, of New York City, reached an aggregate of \$224,723,350, as compared with \$225,320,900 in 1912, \$234,337,250 in 1911, and \$234,470,650 in 1910, or the most favorable record since 1902. The first five months of the year 1913, gave promise of a material reduction in the fire waste, but the four summer months, during which unusual dry weather was experienced, developed very serious losses, which more than offset the favorable conditions prevailing earlier.

There were no general conflagrations of any magnitude during the year in the United States, the largest fire being a general fire involving several blocks at Hot Springs, Ark., in September, which caused a property loss of about \$2,225,000. There were, however, during the year, forty-four fires, each of which caused an estimated property damage of \$500,000 or over, and these, as recorded by the *Journal of Commerce*, are listed below. The popular movement for fire prevention received no little legislative encouragement during 1913, and in many States laws were in force which were enacted in 1912, with a view of diminishing the number of preventable fires. These provided for fire marshals, inspection, proper conditions of mainte-

nance, and like measures. Whether it was too early to look for their effect or not, the destruction of property by fire showed only a very moderate diminution.

Chicago, Ill., business block.....	\$ 500,000
Calgary, Alberta, meat-packing plant..	910,000
Savannah, Ga., wharf and railroad property	1,100,000

Cohoes, N. Y., knitting mill and other..	536,000
Peoria, Ill., storage warehouse.....	660,000

MOTOR APPARATUS. The annual meeting and convention of the International Association of Fire Engineers was held in New York City during the first week in September, and was noteworthy for the display and test of new motor apparatus and for the papers dealing with questions of modern fire protection and especially incendiaryism. Probably the most extensive test of motor fire apparatus ever undertaken was conducted on the pier at the foot of 53d Street, at the North River, under the auspices of the New York fire department and a committee of engineers of the National Board of Fire Underwriters. These tests were arranged for 12 hours and were designed to test the capacity and efficiency of the various engines at different pressures. Eleven machines were entered for test, and seven were in service at the end of the twelve hours. There were, as might be expected, incidental break downs during the test, but on the whole, the machines performed satisfactorily and showed that distinct progress had been made in the development of a few years and that the defects were largely mechanical and could readily be overcome. It was interesting to note that most of the machines entered gave at least their rated capacities, and several did better. Furthermore, there was an increase

in capacity more nearly approaching that of the largest size steam fire engines than hitherto had been attempted, one motor engine in particular, discharging 636 gallons per minute at a pump pressure of 269 pounds, 748 gallons per minute at a pump pressure of 209 pounds, and 1419 gallons at a pump pressure of 130 pounds. In connection with motor apparatus the leading cities of the United States were gradually adding to their equipment motor propelled apparatus of all kinds and were using tractors to haul existing steam fire engines and ladder trucks. In the larger cities a tendency towards standardization was being manifested and in New York a large number of front-drive tractors were provided for steam fire engines and hook and ladder trucks.

PROGRESS. Towards the end of the year 1913 provision was made for wireless communication between the fleet of fire boats of the New York City fire department and the central bureau of the fire alarm telegraph at fire headquarters, 157 East 67th Street. Beginning with the fire boat *James Duane*, a receiving and sending apparatus was fitted on the fire boats and an installation at fire headquarters of aerial wires on the roof. In this way it was possible to receive calls from incoming ships with fires in the cargo and transmit them immediately to the fire boats, or to maintain communication with the fire boats after they had left their station in response to an alarm, or for other purposes. As the fire boats respond to alarms just as an ordinary engine company, and many of these are ascertained to be false, it was believed that the use of wireless to recall the boats would be an economy of fuel and would save the long trips along the water front that often were required.

Progress was made during the year with the much needed reconstruction of the New York City fire alarm telegraph. Work was prosecuted on the various new central stations in the different boroughs, that in Manhattan being located in the centre of Central Park on the Transverse Road. New fire alarm boxes were provided in many cases and the underground circuits were improved and extended with a view to their utilization in the new system when completed. A new type of box was developed by the chief electrical engineer of the department, Leonard E. Day, and his assistant, Mr. Faller, and this box embodied all of the features of previous apparatus of this type, as well as advantages of its own. See **FORESTRY, AND INSURANCE.**

FISH AND FISHERIES. The last report of the commissioner of fisheries of the United States, available at the time of preparation of this record, was dated December 2, 1912, and was for the year ending June, 1912. For the calendar year 1911, the United States, including Alaska, but not including the insular possessions, had 225,000 persons engaged in the fisheries, using 7500 vessels, with a total capital investment of \$65,000,000. The first value of the yield was \$76,000,000. These fisheries were more valuable than those of any other country with the exception of Japan. The mackerel fisheries were reported as having reached a lower state than ever before, while menhaden were very important, establishments for the manufacture of oil and fertilizers from these fish being more numerous than ever be-

fore. In Maine the lobster fishery was more valuable than in all other States combined, and the numbers seem to be increasing as a result of protection and artificial propagation. The most valuable single fish in New England was the cod, though a very large catch of swordfish was reported for the year, off the New England coast. The oyster industry of the United States was larger than that of all other countries combined, a detailed statement of recent statistics being as follows:

	Bushels	Value
New England States for 1910.....	5,827,821	\$ 3,589,719
Mid-Atlantic States for 1911.....	23,189,557	10,899,457
South Atlantic States for 1910.....	1,700,998	864,184
Gulf States for 1910.....	6,226,141	1,476,966
Pacific States for 1908.....	309,448	698,700

The whale fisheries were reported as declining in value and will eventually die out, unless some international agreement can be made as to their protection on the high seas.

The value of fish landed at the port of Boston was as follows:

	Pounds	Value
From United States.....	109,226,119	\$2,803,462
" Newfoundland.....	30,943,353	877,462
" Canadian provinces....	44,283,895	1,343,716

The commissioner reported that the propagation and distribution of food and game fishes was regarded as of the utmost importance by the bureau, and that 40 species of food and game fishes and of lobsters were propagated during the year. The output of fry for the year was 3,428,000,000; of eggs, 229,600,000; of fingerlings, yearlings, and adults, 32,214,000. There were received during the year 9446 applications for stock, mostly for artificial and private ponds. Earlier shipments of rainbow trout to Europe had not proved successful, due to deterioration from inbreeding, and hence new supplies were sent during the year to Austria, France, Germany, Japan, and Portugal. Brook trout were sent to Japan, and black bass to Sweden.

The international agreement concerning the seal fisheries went into effect in the spring of 1912. This limited the killing to young males with skins weighing not less than 5 pounds, green. No killing was permitted until 1000 three year olds were reserved. During the year, 12,002 skins were shipped to London, and sold for \$385,862.28. By an order issued later than the date of this report, these skins in future, were to be sold in St. Louis, rather than in London. According to the Associated Press dispatches, the sale held in December, 1913, brought in approximately \$80,000. In this sale, there were 1898 seals, worth \$60,000, 405 blue fox worth \$17,324, and 31 white fox worth \$458. The blue fox herd on the Pribilof Islands were managed for the first time by the United States in 1910-11. These skins are valuable, some selling for as much as \$85 apiece. The proceeds from this source for the year (1912) were \$15,096.58. The total appropriation for the bureau for the year was \$1,132,990.

FISHERIES. See section so entitled under various countries and States of the United States.

FISK UNIVERSITY. An institution of

higher education for the colored race, at Nashville, Tenn., founded in 1866. The enrollment in all the departments of the university in the autumn of 1913 was 482. Of these, 196 were in the college department, 146 in the preparatory school, and 140 in the training school. The faculty numbered 43. In 1913 former Dean H. H. Wright retired on a Carnegie pension. Dr. C. W. Morrow was appointed dean in his place. C. C. Poindexter, president of biology and agronomy, died in 1913, and J. T. Caruthers was appointed in his place. Mrs. Louise C. Berry was appointed dean of the women. During the year the university received a single gift of \$20,000, and several smaller ones. The gross receipts from benefactions were \$42,705. The productive funds of the university at the end of the year 1912-13 amounted to \$58,395, and the income to \$60,990. The library contains about 10,000 volumes.

FITZ, REGINALD HEBER. An American physician and educator, died September 30, 1913. He was born in Chelsea, Mass., in 1843, and graduated from Harvard University in 1864. Two years later he received the degree of A.M. from that university. He studied medicine at the Harvard Medical School, taking his degree in 1868. In 1870-73 he was instructor of pathology at the Harvard Medical School; assistant professor in 1873; professor in 1878; Chittuck professor in 1879; from 1892-1908 Hersey professor of the theory and practice of physic. He retired with the title of emeritus professor in 1908. Dr. Fitz was credited with making the discovery of appendicitis. He was the author with Dr. Horatio C. Wood of the *Practice of Medicine* (1897). He received the degree of LL. D. from Harvard in 1905.

FLAGLER, HENRY M. An American capitalist, died May 20, 1913. He was born in Canandaigua, N. Y., in 1830. His father was a Presbyterian minister whose salary was barely sufficient to keep his family in the necessities of life, and the boy when fourteen years of age resolved to earn his own living. Starting in search of an opportunity, he landed finally at Republic, O., and was engaged by a storekeeper at a salary of five dollars a week. After some years he had established a grain business at Bellevue, O. During the carrying on of this business he shipped many carloads of wheat to John D. Rockefeller, then a Cleveland commission merchant. Rockefeller and his son William had at this time started a small oil refinery in Cleveland, and in 1867 they built a second refinery. Flagler, who was furnished capital by a relative's wife, bought a partnership in this concern, which became Rockefeller, Andrews & Flagler. The business prospered with the acquirement of several other refineries which had been built for the purpose of competition, but which the owners were obliged to sell to the Rockefeller Company. In 1870 the partnership closed, and the Standard Oil Company was organized. Mr. Flagler had charge of the details of the transportation for the company. From this time Mr. Flagler's commercial career is identified with the Standard Oil Company. He was often called the "second power" of the company, and up to June, 1908, was its vice-president and director. Mr. Flagler is best known to public life, not as one of the great powers of the Standard Oil Company, but as the developer of the east coast of Florida

as a summer resort. He first became interested in the possibilities of what was then the wilderness of Florida for fruit growing, and he decided to open up this country by means of railroads. With this end in view he acquired, in 1886, the Jacksonville, St. Augustine, and Halifax River Railroad. Two years later he bought the Augustine and Palatka Railroad, and the St. Johns and Halifax, which ran through Daytona, and a narrow gauge road. Up to 1892 he devoted his energy to improving these roads. In that year he began the construction of a line south from Daytona for the purpose of opening up the wilderness. In that year thousands of orange trees were planted along the line of the railroad, but these were blighted by the frosts. Mr. Flagler then decided to run his road beyond reach of frosts, and in 1894 he carried it as far as Palm Beach, but the frosts again worked havoc among the orange trees and the road was extended in 1896 to Miami. In 1905, when the Panama Canal was assured, Mr. Flagler conceived the idea of running his railroad to Key West. This road was completed in 1912, forming the East Coast of Florida Railroad. It is constructed to a large extent across the keys or islands which form a large part of that portion of the State, and its construction was one of the most remarkable feats of railway engineering ever undertaken. In addition to the construction of railroads and the development of fruit lands Mr. Flagler built several of the largest hotels in the United States. These include the Palm Beach Hotel, the Ponce de Leon and Alcazar at St. Augustine. Mr. Flagler is said to have spent over \$40,000,000 in Florida, of which \$18,000,000 was spent in developing railroads, \$12,000,000 in hotels, and \$1,000,000 in steamboat and other enterprises. He was a director in many important financial institutions and railway companies, including the Western Union Telegraph Company, the Chicago, Rock Island, and Pacific Railway, the Minnesota Iron Company, the Duluth and Iron Range Railroad, and the International Bank Note Company. He left a fortune estimated at between \$50,000,000 and \$60,000,000. His only son, H. H. Flagler, received but an insignificant portion of the estate.

FLAX. The world's production of flaxseed in 1913 was estimated at 120,000,000 bushels, as compared with 133,000,000 bushels in 1912. In India, where a long-continued drouth prevented seeding at the proper time and thus reduced the acreage, the crop was about 20 per cent. less than the year before. Russia produced about 25,000,000 bushels, yield and quality being better than the previous year. Argentina devoted 4,391,000 acres to flaxseed, and a favorable season raised the total production to above that of the previous year. As reported by the Department of Agriculture the United States produced a crop of 17,853,000 bushels on 2,291,000 acres, making an average yield of 7.8 bushels per acre. As compared with 1912, a year of very large production, this represented a decrease of 10,220,000 bushels and of 560,000 acres, the rate of yield being diminished by 2 bushels. Among the 11 producing States, all showing reduced yields except Wisconsin, North Dakota led with 7,200,000 bushels, followed by Montana with 3,600,000, Minnesota with 3,150,000, and

South Dakota with 3,060,000 bushels. North Dakota produced 4,886,000 bushels; Montana, 1,920,000; Minnesota, 971,000; and South Dakota, 2,263,000 bushels less than in 1912. The shortage was due mainly to a prolonged drouth. The Canadian crop was reported at 15,168,000 bushels, against 21,682,000 bushels in 1912. The farm value of the crop of the United States on December 1 at \$1.20 per bushel was \$21,399,000, the lowest during the past 10 years. With the surplus carried over from 1912 the world's supply for the commercial year is adequate. Owing to greater demand and higher prices European countries gave more attention during the past year to fibre production.

FLOOD. See OHIO VALLEY FLOOD.

FLORIDA. POPULATION. The population of the State in 1910 was 752,619. According to the estimates of the Bureau of the Census, made in 1913, the population then was 825,420.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	675,000	10,125,000	\$3,320,000
	1912	655,000	8,615,000	3,727,000
Oats	1913	50,000	900,000	630,000
	1912	43,000	740,000	518,000
Rice	1913	400,000	10,000	6,000
	1912	600,000	15,000	14,000
Potatoes	1913	12,000	912,000	1,056,000
	1912	11,000	1,023,000	1,125,000
Hay	1913	47,000	a 63,000	1,147,000
	1912	43,000	54,000	977,000
Tobacco	1913	4,000	b4,000,000	1,240,000
	1912	3,100	2,604,000	781,000
Cotton	1913	218,000	c 68,000	5,564,000
	1912	224,000	52,895	3,980,000

a Tons. b Pounds. c Bales.

MINERAL PRODUCTION. Florida is important as a producer of minerals on account of the large quantity of phosphate rock mined in the State. This constitutes over 90 per cent. of the value of the total output. In 1912 the total production of phosphate rock in the State was 2,406,899 long tons, valued at \$9,461,297. The State is also first in the production of Fuller's earth. It leads in the production of ball clay, a very plastic clay used in giving plasticity to the body of high-grade products. The other mineral products of the State are sand, lime, brick, mineral waters, sand and gravel, and stone. The total value of the mineral products of the State in 1912 was \$10,272,594, compared with \$10,250,228 in 1911.

FINANCE. The report of the State treasurer showed a balance at the beginning of the fiscal year 1913 of \$1,011,535. The receipts during the period were \$3,681,298. The disbursements amounted to \$3,224,999, leaving a balance at the end of the fiscal year of \$1,467,832. The chief disbursements were for the State departments, for education, and for State institutions. The public debt, consisting solely of refunded bonds, amounted at the end of the fiscal year of \$701,567.

COMMUNICATIONS. The total number of lines of main track in the State on June 30, 1912, was 3596, and the total mileage of all tracks was 5423. The licensed railroads in or passing through the State are the Seaboard Air Line, 939 miles; the Atlantic Coast Line, 877 miles; the Florida East Coast Railroad, 522 miles; the Louisville and Nashville, 216 miles; and

the Apalachicola Northern Railway, 102 miles.

EDUCATION. The approximate school population of the State in 1913, was 256,418. The total enrollment in 1912 and 1913 was 166,871, and the average daily attendance was 118,465. The female teachers numbered 3514 and the male teachers 1018. The average salary of male teachers was \$67.47, and of female teachers \$39.21, monthly.

CHARITIES AND CORRECTIONS. The institutions supported by the State include the Deaf, Dumb, and Blind Institute, Confederate Soldiers' Home, the State Asylums for the Insane, the State prisons, and the State Industrial School for Boys. The latter is really two schools, one for white and the other for colored boys. The average number of inmates in this institution is from 175 to 200.

POLITICS AND GOVERNMENT. The legislature met in 1913, and passed several important measures. The term of the governor expires in January, 1917. The next State election is November 3, 1914. An equal suffrage amendment was defeated in the House of Representatives on May 2.

The restrictive legislation, which prevented the Japanese from holding land in California, resulted in a number of Japanese seeking to acquire property in Florida. Lands in that State owned by William S. Jennings, a former governor, were offered to the Japanese, who were previously residents of California. These lands were about 45 miles from Jacksonville, in Clay and Duval counties. Objection was at once made to the acquisition of these lands by Japanese. Representative Clark, one of the Florida members of the House, addressed to the governor of the State a letter urging him to call a special session of the legislature, for the enactment of a law similar to that passed in California, prohibiting the ownership of land by aliens. In this letter he said: "Japan is looking for territory. It is her purpose to colonize parts of Mexico, and it is also her purpose to place in the United States as many Japanese as we will permit to live here, her ultimate purpose being war with this country." Following this discussion the promoters of the movement withdrew their offer, and no further effort has been made to colonize Japanese in Florida. The legislature of 1913 authorized the State board of commissioners of the Everglades drainage district to issue bonds to the amount of six million dollars to continue the work of reclamation of the Everglades. A survey of the project has been completed under the supervision of Isham Randolph, and work on the drainage canals is going steadily forward.

LEGISLATION. The legislature met in 1913, and the most important measure passed was a general primary election law (see **ELECTORAL REFORM**). This law contains first- and second-choice features.

STATE GOVERNMENT. Governor, Park M. Trammell; Secretary of State, H. C. Crawford; Treasurer, J. C. Luning; Comptroller, W. V. Knott; Attorney-General, Thomas F. West; Auditor, Ernest Amos; Adjutant-General, J. C. R. Foster; Superintendent of Public Instruction, W. N. Sheats; Commissioner of Agriculture, W. A. McRea—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, J. B. Whitfield; Justices, W. A. Hocker, R. F.

Taylor, T. M. Shackelford, and R. S. Cockrell; Clerk, Milton H. Mabry—all Democrats.

STATE LEGISLATURE, 1913. The legislature is: Senate, Democrats, 32; House, Democrats, 71.

The State representatives in Congress will be found in the article **UNITED STATES**, section *Congress*.

FLORIDA. UNIVERSITY OF. A State institution for higher learning at Gainesville, Fla., founded in 1905. The total number of students enrolled in all departments in the autumn of 1913 was 348. The faculty numbered sixty-one. There were six members added to the faculty during the year. The university received \$40,000 for a school of education from the Peabody education board. The income amounts to about \$110,000 a year, and the endowment to about \$158,000. The library contains about 20,000 volumes. The president is A. A. Murphree, LL.D.

FLOUR. See **FOOD AND NUTRITION**.

FLY. See **ENTOMOLOGY**.

FOOD AND NUTRITION. FOOD INSPECTION. The United States food and drugs act of 1906 was amended by requiring the labeling of foods in packages to show the approximate net quantity of the contents. Exemptions were made as to domestic products prepared and foreign products imported prior to September 3, 1914, and also foods in very small packages, such as candies.

The application of the law was also extended by administrative order to include domestic meat and meat food products. These materials had hitherto been subject to seizure only when found in establishments where Federal supervision was maintained under the meat inspection law. Decisions were also promulgated prohibiting the sale of frozen citrus fruit, and dealing with the sophistication of brandies.

Approximately 10,000 samples of food and drugs were collected for examination under the law, and a total of 1048 violations were reported for prosecution, of which 652 were criminal cases. Of the 1250 cases terminated during the year, fines aggregating \$23,463.50 were imposed in 596 criminal cases, and decrees of condemnation and forfeiture entered against 365 shipments of adulterated or misbranded goods. An earlier decision in favor of the government contention that flour bleached with nitrogen peroxide is adulterated and misbranded was reversed by a higher court, and the case was pending before the United States Supreme Court at the close of the year.

State legislation as to the labeling of package goods to show the net quantity was adopted in Iowa, Michigan, Oregon, and South Dakota. The sanitary inspection of bakeries, canneries, restaurants, etc., was taken up in Iowa, Ohio, South Dakota, and Wyoming, while Connecticut, Iowa, Nebraska, and North Dakota undertook the regulation of cold storage practices. Amendments to pure food laws were also adopted by Nebraska, Nevada, New Jersey, New York, and Utah. Efforts were under way to bring about closer cooperation between the Federal and State inspection.

COST OF FOOD. Although there were some fluctuations in food prices, *Bradstreet's* reported the highest yearly index number in its history. Eggs, meats, livestock other than beef, fish, milk, cereals other than wheat, fruits,

potatoes, and tea were some of the principal commodities which were higher December 1, 1913, than a year previously. Data gathered by the U. S. Bureau of Labor showed that on August 15, 1913, retail prices in forty industrial cities housing one-fifth of the population of the country, were eight per cent. higher for the fifteen principal articles of food than on the corresponding date of the previous year, while as compared with the ten-year period, 1890-99, fourteen of these items showed increases ranging from 27.9 per cent. with wheat flour to 138 per cent. with smoked bacon, and the only commodity to show a decrease was sugar (2.3 per cent.).

The high prices and their causes were subjects of much speculation and inquiry, their effects being felt to a greater or less extent in every civilized country. An exhaustive study in Great Britain showed that during the last seven years the retail prices of food and coal increased 13.7 per cent. The high cost of meats in Germany led to the establishment of municipal markets in Nuremberg, the encouragement of the substitution of fish by the establishment of municipal fish markets, and free lessons in cooking and recipes. A government commission on the high cost of living was appointed in Canada. A congressional inquiry was being organized in the United States at the close of the year, and a committee was designated by the secretary of agriculture to investigate meat production.

The influence of cold storage on prices was a phase receiving much consideration. A careful study by the U. S. Department of Agriculture indicated that the increased prices were the product of many factors of which cold storage was only one, and that while it had tended toward uniformity of prices throughout the year, it had not so resulted with all commodities nor with all periods.

Efforts were being made to utilize the parcel post for shipments of farm produce direct to the consumer, and while it had become apparent that the method had its limitations, it also seemed to present considerable possibilities. There was also increased interest in the formation of coöperative associations both for selling and purchasing farm produce.

NUTRITION STUDIES. The U. S. Department of Agriculture, through its nutrition investigations, advocated the increased use of mutton as an important foodstuff at a reasonable cost. Other studies of fresh and frozen mutton showed that the interior of these meats remained sterile at temperatures of from 2 to 19° F. for months, and that there were only slight chemical changes of the same nature as in the ripening of fresh meat. The Bureau of Chemistry demonstrated that by proper methods in the refrigeration of dressed poultry in transit and the handling and preservation of eggs much of the deterioration and waste encountered in marketing these commodities may be avoided. The most favorable car temperature for dressed poultry is apparently 30° F. or lower, and its uninterrupted maintenance is of special importance.

A large percentage of the so-called graham flours on the market was found to be made by mixing inferior grades of flour with bran, although a great many millers still utilize the original process of grinding the whole kernel.

In bread-making tests, the use of acid extracts of bran in place of a part of the water produced larger loaves with a better color and texture, especially with the stronger flours. Similar but less pronounced results followed the use of water extracts and bran. An increase in the amount of salt used up to three pounds per barrel of flour gave a larger volume and improved the texture and grain, but any larger amounts impaired the quality, although this depended in part upon the time of year and the hardness of the water. Bread was kept fresh from ten to fifteen hours by storing it in an atmosphere with eighty-five per cent. humidity, maintained by a shallow pan filled with saturated salt solution and an air circulation kept up by a small ventilating fan. It is suggested that such an apparatus might obviate night work in some bakeries.

Analyses at the Connecticut State Experiment Station of some 500 samples of so-called diabetic foods demonstrated much variation and considerable misrepresentation in these products, their protein content ranging from eighty-seven to eleven per cent. and that of carbohydrates from four to seventy-six per cent., while the cost varied from 9 cents to \$1.56 per pound. An examination of eight canned chicken soups at the North Dakota station indicated that in many of these goods beef, beef extract, and excessive amounts of boiled rice had been substituted for chicken. The Bureau of Chemistry found that ten commercial brands of bouillon cubes contained from fifty to seventy-four per cent. of common salt, and that while the cubes are valuable stimulants or flavoring agents, they have far less food value than home-made beef broths and soups which may be readily prepared at a fraction of the cost.

Cooking vegetables in steam was found to prevent the loss of most of the mineral constituents and was especially effective with carrots. A study of the raw juices of cabbage, lettuce, onions, cucumbers, horseradish, etc., indicated that most of these materials possessed considerable enzymic power, notably catalytic activity and tryptic and diastatic action. These findings were believed to suggest a possible explanation of the favorable action of fresh vegetables in the prevention of such diseases as scurvy and beriberi.

With reference to the influence of shellfish in transmitting typhoid fever and similar diseases, the contention was urged that oysters are a source of danger only when floated in polluted waters during their non-hibernating periods. More stringent regulations were advocated as to clams, as these were considered a more serious source of danger since they thrive under polluted conditions.

Several investigations of aluminum cooking utensils agreed in showing that, as now constructed by reputable manufacturers, such utensils are free from risk of poisoning. Studies of the use of ice indicated that, with more economical methods of ice manufacture and distribution and the substitution of properly constructed and insulated refrigerators for the majority of those in common use, refrigeration much superior to those now found in most homes could be obtained for much less than the present cost. Keeping unsterilized milk for infants warm in vacuum bottles was condemned, inas-

much as such conditions are especially favorable to the growth of bacteria.

Studies of the various proteins by Osborne and others again showed wide difference as to their utilization by the body. Similar differences were also discovered in the natural fats, unsalted butter and egg yolk proving much superior to lard.

BOOKS OF THE YEAR. Some of the more important books to appear in 1913 were: J. Westervelt, *American Pure Food and Drug Laws* (Kansas City, Mo.); American Academy of Political and Social Science, *The Cost of Living*, and *Reducing the Cost of Food Distribution* (Philadelphia); Mary S. Rose, *A Laboratory Handbook for Dietetics* (New York); A. Bryce, *Modern Theories of Dietetics and Their Bearing upon Practical Dietetics* (London); Louise S. Bryant, *School Feeding, Its History and Practice at Home and Abroad* (Philadelphia and London); D. McKay, *The Protein Element in Nutrition* (London).

FOOTBALL. Harvard for the second year in succession won the eastern intercollegiate football championship, going through the season without suffering a single defeat. The wonderful kicking ability of Charles Edward Brickley was the chief factor in the Crimson's fine showing, but much credit also must be given to the effective coaching system established at the Cambridge institution by P. D. Haughton. The Harvard eleven had little difficulty in defeating the teams sent against it, the closest struggle being that with Princeton, where Brickley's toe was responsible for the only score. In the game against Yale, Brickley also distinguished himself by making five goals from the field, four on drop kicks and one from placement. The fact remains, however, that the skill shown by the other members of Harvard's back field in advancing the ball into Yale territory gave Brickley his opportunities for scoring.

The ranking of the Eastern teams outside of Harvard is a difficult matter. Carlisle School was placed second to the Crimson by several experts. The Indians reached their top form in the contest with Dartmouth, which in turn had been victorious over Princeton. Dartmouth seems to be clearly entitled to third place with the other colleges arranged in the following order: U. S. Military Academy, Yale, U. S. Naval Academy, Princeton, Cornell, Colgate, Pennsylvania, Washington and Jefferson, and the University of Pittsburgh.

Among the surprises of the 1913 season were the victories of Cornell over Pennsylvania, Colgate over Yale, and the Army over the Navy. In intersectional games Michigan defeated Pennsylvania, Cornell, and Syracuse. Notre Dame, also a Western institution, won fame by her brilliant victory over the U. S. Military Academy through the expert use of the forward pass. Chicago won the conference college championship by making a clean sweep of its games. A summary of the principal football games of the leading colleges in 1913 follows:

Harvard defeated Maine 34-0, Bates 14-0, Williams 23-3, Holy Cross 47-7, Pennsylvania 37-0, and Yale 15-6. Carlisle defeated Lehigh State 29-0, Cornell 23-6, Princeton 3-0, Brown 21-7, Cornell 7-0, Dartmouth 35-10, and Syracuse 35-27. Carlisle was defeated by Pittsburgh 6-12, and Brown 0-13, and tied by Pennsylvania 7-7. The U. S. Military Academy defeated Rut-

gers 29-0, Colgate 7-6, Stevens 34-0, Tufts 2-0, and the U. S. Naval Academy 22-9, and was defeated by Notre Dame 13-35. Yale defeated Wesleyan 21-0, Holy Cross 10-0, Lafayette 27-0, Lehigh 37-0, and Brown 17-0; tied Princeton 3-3, Maine 0-0, and Washington and Jefferson 0-0, and was defeated by Colgate 6-16, and Harvard 5-15. The U. S. Naval Academy defeated Dickinson 29-0, Lehigh 39-0, Bucknell 70-7, New York University 48-0, and Pennsylvania State 10-0; tied Pittsburgh 0-0, and was defeated by the Army 9-22. Dartmouth defeated Colby 53-0, Vermont 33-7, Williams 48-6, Princeton 6-0, Amherst 21-7, and Pennsylvania 34-21, and was defeated by Carlisle 10-35. Princeton defeated Rutgers 14-3, Fordham 69-0, Bucknell 28-0, Syracuse 13-0, and Holy Cross 54-0; tied Yale 3-3, and was defeated by Dartmouth 0-6, and Harvard 0-3. Chicago defeated Indiana 21-7, Iowa 23-6, Purdue 6-0, Illinois 28-7, Northwestern 14-0, Minnesota 13-7, and Wisconsin 19-0.

The "All-American Eleven," as picked by Walter Camp, was made up as follows: Ends, Hogstett, Dartmouth, and Merrilat, Army; tackles, Talbott, Yale, and Ballin, Princeton; guards, Pennock, Harvard, and Brown, Navy; centre, Des Jardien, Chicago; quarterback, Huntington, Colgate; halfback, Craig, Michigan, and Brickley, Harvard; fullback, Mahan, Harvard.

There were fourteen deaths attributed to football in 1913, while 175 players were reported as injured. No serious accidents occurred in contests between the higher class teams, indicating that the revised game is not a dangerous sport provided the players are under the care of competent trainers.

Association football or "soccer" is rapidly gaining in popularity in the United States. During 1913 the United States of America Football Association was formed, and this organization is contributing largely to the success the sport has attained. A summary of the more important soccer championships decided during the year follows:

American Football Association, won by the True Blues of Paterson, N. Y.; American Amateur Association, won by the Yonkers, N. Y., Field Club; Intercollegiate, won by Haverford; N. Y. State Amateur League, won by the Brooklyn Celtics of Brooklyn; Field Club Soccer League of New York and New Jersey, won by the Staten Island Cricket and Tennis Club of Livingston, N. Y. The annual match between Oxford and Cambridge at London, England, resulted in a tie score, 2-2.

FOOTE, LUCIUS HARWOOD. An American diplomat, died June 4, 1913. Born at Winfield, N. Y., in 1826 and graduated from the Western Reserve University in 1850, he crossed the plains in 1853 to California, and in 1856 was admitted to the bar there. In the same year he was appointed municipal judge of Sacramento, serving for four years, then becoming collector of the port of Sacramento. He served as consul to several cities in South America, and in 1882 conducted a special diplomatic mission to Central America. In the same year he was appointed minister to Korea, where he distinguished himself in the protection of Japanese and other foreigners in the nationalist revolt in 1883. For this he received the thanks of the emperor of Japan, the emperor of China, and

the emperor of Korea. He resigned his post in 1884. In 1890 he became secretary and treasurer of the California Academy of Sciences. He wrote several volumes of poems, including *Red Letter Day and Other Poems* (1882); and *On the Heights* (1887).

FORBES, HENRY PRENTISS. An American theologian and educator, died October 2, 1913. He was born in Paris, Me., in 1849, and graduated from the St. Lawrence University Theological School in 1873. In 1874-75 he studied at Leipzig. He was ordained to the Universalist ministry in 1874, and from 1875-80 was pastor of Danvers. In the latter year he was appointed professor of Biblical literature at the theological school at St. Lawrence University. From 1899 until his death he was dean of this school. He wrote *The Johannine Literature and Acts* (1907).

FORD, PATRICK. An Irish nationalist and editor, died September 21, 1913. He was born in Galway in humble circumstances in 1845, and at an early age emigrated to the United States. He became a compositor, and with the aid of borrowed money founded the *Irish World* in New York City, with himself as editor, and his brother Augustine as manager. To this paper contributed some of the most famous of Irish nationalists, including Thomas Mooney and O'Donovan Rossa. The paper became a great power for the cause of Irish nationalism in the United States and Great Britain. Large sums were collected by its aid and sent to the Irish nationalists for the spreading of their propaganda. In 1876 the skirmishing fund, the chief purpose of which was declared to be the burning of London and other English cities, was started in the *Irish World*. Personally, Ford was quiet and unobtrusive in manner, and rarely appeared at Irish political demonstrations. He continued until the time of his death to be one of the chief collectors in the United States of subscriptions in aid of the Nationalist party.

FOREST FIRES. See **FORESTRY, Fire Protection Work.**

FORESTRY. For the year ended June 30, 1913 the United States exported forest products of all kinds worth \$124,784,215, and imported \$180,428,074 worth. This represents a gain of \$16,661,961 in exports and \$7,904,609 in imports. According to the U. S. Census estimate, the lumber production in the United States for 1912 was 39,158,414,000 feet, board measure, as increase of 2,155,207,000 feet over 1911. Of the total cut, soft woods furnished 30,526,416,000 feet, and hardwoods 8,631,988,000 feet. The production of lath in 1913 was 2,719,163,000, and of shingles 12,307,685,000.

FIRE PROTECTION WORK. Twenty-four States organized forest fire protective systems. Preventive measures, applying to railroads, lumbermen, and others, were enacted in thirty States. Fourteen States were actively coöperating with the Federal government, under the Weeks law, in the protection of forested watersheds on navigable streams. The number of patrol associations organized by forest owners was materially increased during the year. A strong coöperative spirit developed between the various interests involved. Similar conditions existed in Canada. The Canadian railway commission organized fire protection on about 25,000 miles of railroad, in which all official

agencies coöperate. With few exceptions the 1913 season was unfavorable for large fires. On the other hand, small fires were sufficiently numerous to fully demonstrate the value of well-organized control. In California and in North Carolina, which States do not have effective protective systems, the forest fire loss amounted to several hundred thousand dollars. Three lives were lost in California. The Western Forestry and Conservation Association, which patrols about twenty million acres of timber in Oregon, Washington, Idaho, Montana, and northern California, reported a season of about average hazard, with fire loss practically nothing. In New York, two fires in the Adirondacks resulted in a loss of \$60,000. On the national forests, California, Arizona, and New Mexico suffered most during the past season. By the middle of September, although 2260 fires were reported, as compared with 2470 in the previous year, only 60,000 acres were burned over, as compared with 230,000 acres in 1912 and 780,000 acres in 1911.

THE NATIONAL FOREST SERVICE. The net area of all national forests on June 30, 1913, was 165,515,518 acres. There were also 21,101,130 acres of alienated land within the national forest boundaries. With the assistance now received by the bureaus of soils and plant industry, new agricultural areas are rapidly being segregated. The entire North Platte division of the Nebraska national forest, comprising 240,000 acres, was recently eliminated. Another elimination in the Rainier national forest was to amount to 23,000 acres. In the Deschutes and Paulina national forests in Oregon it was decided to recommend a revision of the boundaries which will eliminate 413,770 acres. Besides the elimination areas, 3,000,000 acres were examined with reference to entry under the forest homestead law. During 1913 the national forest reservation commission approved for purchase tracts aggregating 425,717 acres, making a total of 713,415 acres thus acquired in the Appalachian and White Mountains under the Weeks law. (See **YEAR BOOK, 1912, FORESTRY.**) Forest operations in these purchases were confined to fire protection work.

The cost of administration, protection, and permanent improvements in the national forests for 1913 was \$5,092,101.41, a total somewhat less than last year. The receipts were: Timber sold, \$1,341,337.63; grazing, \$1,007,739.51; special uses, \$118,512.93. After deducting all refunds, the excess in receipts over last year was \$282,663.94. Out of the total receipts of \$2,391,920.85, thirty-five per cent. will go to the States in which the forests are situated for the benefit of their schools and roads. The various States involved have received about \$3,000,000 from this source since 1906.

The forest service collected 40,000 pounds of tree seed in 1912 for use in reforestation work. The total area reforested was about 30,000 acres. In 1912 the forest service distributed 116,000 basket willow cuttings: 15,000 to forest schools, 20,000 to agricultural experiment stations, and 81,000 to individuals. A national arboretum was being established in Rock Creek National Park, District of Columbia. Eventually it will contain all American tree species which will thrive there.

The national forests contained water power with an aggregate estimated capacity of 12,-

000,000 horse power, available for use under permit from the Secretary of Agriculture. More than 800,000 horse power under conditions of lowest stream flow had been developed. In order to prevent exorbitant charges for power to settlers in the vicinity of the national forests, the maximum rate which power companies may charge was definitely fixed in the permit.

The forest service maintained in 1913 nine experiment stations for studies in reforestation and similar subjects. In forage and range investigations, the most notable event of the year was the establishment of the Utah experiment station on the Manti forest, where all intensive experiments were to be centralized. Studies of a large number of important commercial trees of the United States, covering their growth, volume yield, utilization, life history, and management, were completed during the year. Studies relative to the closer utilization of national forest timber, wood preservation, chemistry, distillation, timber physics, and pulp and paper investigations were continued. About 4000 timber tests were made at the forest products laboratory each month. A final monograph on the results of these tests was in preparation. In proportion to its weight, California redwood was found the strongest conifer so far tested. This strength is due to its long wood fibres.

FORESTRY LEGISLATION. The forestry clause of the New York State constitution was amended to permit restricted use of the forest preserve for the development of water power, storage reservoirs, etc. The Pennsylvania laws provided for a low annual tax on private forest lands voluntarily placed under State supervision. A deferred tax on the value of the timber was to be assessed and paid when the timber was cut. The recent legislature permitted the Department of Forestry to lease permanent camp sites within the State forests. South Dakota had an organized State forest service. A bounty was provided for planting forest trees in that State. North Dakota created the office of State forester, and provided for the establishment of State nurseries, as well as the distribution of forest trees and seeds. In Kentucky cooperative agreements between the State board of forestry and the Federal government under the Weeks law were approved. By a law passed in Connecticut, timber growers and owners were required to pay the present assessed value of land and of timber over ten years old. Timber below this age and all new plantings were exempted from taxation, and in all cases the owner was protected from increased taxation for a period of fifty years, or until the timber was cut, when a ten per cent product tax would be assessed. In New Hampshire provision was made for the municipal purchase and maintenance of forests under direction of the State forester. In Vermont established reforested areas were to be taxed on the land value alone, and not to exceed \$3 an acre. The State forest lands in Oregon had been withdrawn from sale for a period of fifty years.

Three new forest reserves were established in Hawaii. There were in 1913 thirty such reserves with a total area of 687,837 acres. The Hawaiian legislature established a division of hydrography, and provided for the conduct of the divisions of hydrography and forestry by setting apart as a special fund the revenues

derived by the Territorial government from leases and licenses of water rights on streams coming from the forests. The amount made available approximated \$67,000 annually, to be equally divided between the two divisions.

CANADA. In Canada the Dominion forest reserves and parks act, as amended on June 6, 1913, added over 10,500 square miles to the Dominion forest reservations, making a total of over 35,800 square miles of reserved forest land in the western provinces, over two-thirds of which was in Alberta.

FORESTRY IN FOREIGN COUNTRIES. At the International Forestry Congress, which was held in Paris in June, a large body of representatives coming from every continent on the globe met for the purpose of studying economic and technical forestry problems and of promoting legislative and administrative reforms leading to the conservation of the forests, the prevention of soil erosion, and the reforesting of waste lands. On December 30, 1913, a resident of Berlin presented to the city a fund of \$1,250,000 in endowment of a forest school for boys. It was expressly provided that the students must be healthy and not hereditarily diseased. The pupils were to be taken on long trips afoot so that they might become acquainted with the "fatherland." There were nearly 6000 professional foresters in Germany who were associated with various technical societies. France spent \$35,000,000 in planting trees on the watersheds of important streams. A French process of "electrocuting" timber was stated to have given perfect seasoning in a single night. With lead plate electrodes on each side, the timber was placed in a solution containing 10 per cent borax, 5 per cent resin, and a little soda, and application of the current expelled the sap and filled the wood cells with the borax and resin.

Provision was made in England for technical advice in forestry. B. B. Ostmaston was placed in charge of the Central and Southern District, and Charles Hawkins was to take charge of the Eastern District. In India important concessions were being offered to paper manufacturers in order to encourage the utilization of bamboo for paper making. The new Chinese Republic established a department of agriculture and forestry. The government of Peru established an experiment station along the Madre de Dios River with the special object of encouraging the cultivation of rubber-producing trees indigenous to the section, and for the purpose of introducing and acclimatizing useful food-producing plants.

FORESTRY SCHOOLS, PERSONNEL, ETC. The New York State College of Forestry at Syracuse started in the fall with a total registration of 203 students. The legislature appropriated \$250,000 for a building for the college. The college was to prepare and carry out a plan of management for the 14,000 acres, lying along the Hudson, controlled by the Palisades interstate park commission. A fifth professorship in forestry was established in the department of forestry at Cornell to cover the university extension work in forestry throughout the State. The forest land equipment at Cornell was increased by a gift of 200 acres; eight woodlots, and a farm of 38 acres had previously been given to the department.

The University of Wisconsin established a 2-year forest ranger course in cooperation with

the State Board of Forestry. The University of Washington substituted a 5-year course for its former 4-year course in forestry, with greater facilities for specialization in the last three years. Two sections of land on the Snoqualmie national forest were secured by the university. A 10-weeks course in practical forestry was established at the University of Idaho. At the Harvard school of forestry hereafter the first year is to include only general and fundamental technical courses. The second year is to be devoted to advanced work in four special fields.

William Dawson of Aberdeen University succeeded A. Henry as reader in forestry at Cambridge. Prof. Henry was appointed first professor of forestry in the Royal College of Science, Dublin. He took up his work April 1, 1913. A new quarterly paper from Yale, known as *The Yale School News*, was issued during the current year. Fred Gordon Plummer, geographer of the U. S. forest service, died at Washington on August 15.

While excavating for a clay mine a sunken forest, entirely petrified and 30 feet below the surface, was recently unearthed near Bakersville, N. J. The forest covered an area of nearly 100 acres.

The New York State Forestry Association was organized at Syracuse, January 16, 1913. The Society for the Advancement of Forest Entomology in America was organized at Washington, March 1, 1913.

LITERATURE. Among recent works dealing with some phases of forestry were: H. J. Elwes and A. Henry, *The Trees of Great Britain and Ireland* (Edinburgh, 1913, vol. 7); C. S. Sargent, *Trees and Shrubs* (Boston and New York, 1913, vol. 2, pt. 4); A. Zimmermann, *Der Manihot-Kautschuk* (Jena, 1913); W. F. de B. MacLaren, *The Rubber Tree Book* (London, 1913); H. H. Gibson, *American Forest Trees* (Chicago, 1913); J. F. Rock, *Trees of the Hawaiian Islands* (Honolulu, 1913); A. F. Blakeslee and C. D. Jarvis, *Trees in Winter, Their Study, Planting, Care, and Identification* (New York, 1913); A. B. Recknagel, *The Theory and Practice of Working Plans* (New York, 1913); C. A. Schenk, *The Art of the Second Growth or American Silviculture* (Albany, 1912, 3d rev. ed.); R. C. Bryant, *Logging* (New York and London, 1913).

FORESTRY ASSOCIATION OF AMERICA. During 1913, the American Forestry Association extended its educational propaganda, by which it enlisted service in securing the proper use and conservation of the forests in every State of the Union, every province in Canada, and other civilized or semi-civilized foreign countries. It is generally recognized as the leading exponent of forest conservation in the western hemisphere. A special feature of its work, by which was secured the most important and valuable addition to the forest literature of the world in many years, was the appropriation of \$5000 to pay the expenses of eleven committees which during 1913 investigated various forest conditions and reported to the National Conservation Congress at Washington in November. These reports represent the most advanced thought of theoretical and practical experts in forestry in the United States and Canada. The association published a monthly magazine, *American Forestry*, of which Percival Sheldon Ridsdale, the executive secretary of the

association, is the editor-in-chief, and this is the only national publication on forestry in the United States. The officers of the association in 1913 were president, Dr. Henry S. Drinker, president of the Lehigh University; treasurer, Otto Luebker, Washington, D. C.; and executive secretary, P. S. Ridsdale, Washington, D. C.

FORMOSA, or TAIWAN. An island dependency of Japan, off the coast of the Chinese province of Fukien. Capital, Dai-Hoku, or Tai-Pei (variously spelled, as Daihoku, Taihoku, Taipei). The island of Formosa has an area of 2,318.5 square ri; the seven adjacent isles, 5.6 square ri; total, 2,324.1 square ri, or 13,841 square miles. Estimated population in 1913, 3,512,607. The estimates of population vary, even as officially reported. The following are taken from the *Résumé statistique de l'Empire du Japon*, published in 1913; population present at the end of 1901, 2,931,098; 1906, 3,193,708; 1909, 3,290,186; 1910, 3,341,217. The latter number was comprised of 3,106,223 civilized and 122,106 uncivilized aborigines, 98,048 Japanese, and 14,840 foreigners. Males were reported at 1,760,019, and females at 1,581,198. Population present of the larger towns December 31, 1911: Dai-Hoku, 95,077 (Jonai 12,420, Moko 33,498, Daitote 49,159); Dainan (Tainan), 59,601; Kagi (Chia-i), 22,418; Rokko (Lukong), 19,153; Kiilung (Kee-lung), 17,962; Shinchiku (Hsin-Chu), 16,294; Gilan (Ilan), 16,062; Shokwa (Chang-Hua), 15,545; Taku (Takow), 13,775; Daichiu (Taichu), 12,788; Toko (Tonkong), 12,230. The census of 1905 showed that 97.62 per cent. of the inhabitants in the administrative were illiterate. The Japanese are developing an educational system.

Important agricultural products are rice, tea, sugar, sweet potatoes, ramie, and jute. The forests yield camphor, worked as a government monopoly. The mineral products include gold, silver, copper, coal, sulphur, and petroleum. Exclusive of the large trade with Japan, imports and exports of merchandise amounted to 12,809,795 and 8,234,097 yen respectively in 1901; 12,737,460 and 9,779,084 in 1906; 19,555,047 and 13,175,590 in 1911; and 19,307,000 and 14,960,000 in 1912. Leading imports in 1911, in thousands of yen: Sugar machinery, 4238; opium, 1880 (against 3643 in 1910); oil-cake, 909; leaf tobacco, 829; rails and accessories, 775; petroleum, 660; paper and manufactures, 599; there is a considerable importation of cotton fabrics. Principal exports in 1910 and 1911 respectively, in thousands of yen: Oolong tea, 3853 and 5228; pouchong tea, 1935 and 1811; refined camphor, 3933 and 3463; sugar, 492 and 956; flax and hemp, 338 and 389; sesame, 137 and 207. Principal exports in 1912: Tea, 6674 thousand yen; camphor, 4410; sugar, 1719. Imports and exports of merchandise by countries, in thousands of yen:

	Imports		Exports	
	1911	1912	1911	1912

Total.....	19,555	19,307	13,176	14,960

Length of railway (1913), 476 kilometers (296 miles). On August 3, 1913, a celebration was held at Dai-Hoku in commemoration of the completion of 1000 miles of steam railway in the Island of Taiwan. Of this amount 327 miles were owned and operated by the government, the remainder by the modern sugar companies. Telegraphs (1912), 1038 kilometers of line and 5499 of wire; telephones, 1218 and 13,787; post offices, 140. The budget for 1912-13 balanced at 45,325,508 yen; for 1913-14, 44,055,366. Formosa is administered by a governor-general resident at Dai-Hoku (in 1913, Lieut-Gen. Count Sakuma Samata).

FOUNDATIONS. A notable foundation under way during the year in New York City was that being built to support the new 38-story Equitable Building, which was to be erected on a lot 167 by 312 feet. This foundation was interesting, not so much on account of the novelty of plan, but for its extent and for the efficient mechanical arrangement for its execution, especially the use of mechanical means for handling the material. Like other portions of lower New York, the ground to be excavated consisted of fine sand down to a 12-ft. layer of hard pan, which overlay bed rock at a distance of about 20-ft. below the curb. As the sand carried much ground water the problem of drainage and keeping the foundation dry was most important and the method adopted to secure this was the construction of a cofferdam consisting of 37 wall caissons enclosing all sides of the lot and extending from water level to bed rock. The corner caissons were about 12 ft. square and the intermediate caissons 25 ft. in length with a thickness of six feet. They were being set close together and their outer faces were placed at the boundary line of the lot. They were bonded together by a system of wells between the adjacent ends which were filled with concrete, a method previously found effective in constructing the foundation for the New York Stock Exchange on much the same kind of soil. These caissons, when completed, support the wall columns of the building and the remaining excavation and the placing of the foundations for the 80 remaining interior columns will be carried on in the open as it was not thought that caissons would be needed. For the concrete caissons which were being sunk by the pneumatic process, it was estimated that 1200 yards of excavation would be required and 1100 yards of concrete.

The foundations for the new Morgan Building in Wall Street in New York City under construction in 1913, were of cement similar in character to those of the Equitable Building. A continuous cofferdam wall, seven feet thick, was built completely surrounding the wall and on this the wall columns will rest and the retaining wall for the cellar excavation be built. In the interior 19 concrete piers were being excavated, but as the caisson built walls surrounding the lot made a completely water tight structure, no difficulty was anticipated in their construction and excavation to a hard pan level. The underpinning of adjoining buildings formed an interesting problem and 19 pneumatic cylinders spaced about twelve feet apart were carried down to hard pan in order to support the adjoining structures. While the new Morgan Building was to be but four

stories in height, the foundations were being made adequate for a twenty-story building.

An interesting construction was under way during 1913 where the Lexington Avenue subway in New York City passes under the old Astor House property at Broadway and Vesey Street. The subway here was being built by tunneling methods, but in order to provide positive support for the tubes independent of any displacement of the sub-soil, four 6 by 8 ft. piers with foundations carried to rock by means of pneumatic-caissons were being provided as additional support. The tops of these piers were 40 ft. below the street level and carried a grillage of I-beams to distribute the load from cradles made of 36 in. plate girders which receive the tunnel tubes. There was in connection with this construction a heavy retaining wall 100 ft. long on Broadway and 167 ft. on Vesey Street, which permitted the excavation of the lot to any required depth without interfering with the tubes as it was being carried down through quicksand to solid rock to a depth of about 90 ft. below the surface. See also **ARCHITECTURE**.

FOX FARMING. The raising of foxes for fur has been exploited to considerable extent and has come into practice in the United States somewhat. On Prince Edward Island the industry has been quite successful, there being about 235 fox ranches there on which about 2500 foxes are kept in captivity, over half of which are classed as silver-black foxes. The *U. S. Daily Consular and Trade Reports* for January 11, 1913, gives an interesting account of the industry there and elsewhere in Canada. Ranches are developing in New Brunswick and Nova Scotia. The skins of the quasi-domesticated animals command the highest prices on the London market, \$1000 and even \$2500 being secured for choice pelts. Breeding stock is exceedingly expensive, \$12,000 to \$15,000 per pair being paid where unusual fertility has been demonstrated. Several islands in Alaska are leased for the breeding of silver-black and blue foxes.

FRANCE. A republic in western Europe. Capital, Paris.

AREA AND POPULATION. The area is officially given as 536,464 square kilometers, equal to 207,129 square miles. The population was in 1911 (census of March 5), 39,601,509, in 1906, 39,252,267. Marriages in 1911, 307,788; births, 742,114; deaths, 776,983; still births, 33,840. Paris had (in 1911) 2,888,110 inhabitants; Marseilles, 550,619; Lyons, 523,796; Bordeaux, 261,678.

EDUCATION. In 1910-11 there were 3967 infant schools, with 8615 teachers and 620,922 pupils; 82,488, with 156,981 teachers and 5,654,794 pupils; 166 primary normal schools, with 1720 teachers and 9326 students; 344 lycées and colleges for boys and 129 for girls, with 97,512 and 30,788 students respectively; 56 girls' secondary courses, with 5503 students. University students, January 15, 1912, 41,194.

The central educational system is under the direction of the ministry of public instruction, and is highly developed. All clerical schools are, by the law of 1904, to be suppressed by 1914. In 1911 there were still 17,175 infant school and 75,292 primary school pupils under clerical teachers. There are numerous special and technical schools, some controlled under

other ministries. Degrees are conferred by state universities alone.

Since the separation (1905) of the state from the Roman Catholic Church, no national religion exists; all creeds are permitted to worship in public. During the transition period pensions and grants were to be paid to the clergy; but no basis of calculation has been agreed upon, the clergy refusing to recognize the new law or to come to any agreement under its conditions.

AGRICULTURE. The total area of the country as given by the army geographic survey is 53,646,374 hectares, differing somewhat from that calculated by the ministry of the interior—52,955,764. It is the latter total that is used in the following account of the distribution of lands, agricultural or other, in 1910; 23,678,846 hectares under great crops and sown meadows, 4,884,400 under natural meadows, 1,568,030 under forage grasses, 3,610,430 under pastures, 1,684,523 under vines, 3,909,480 uncultivated lands, 1,372,486 in rosaries, shrubberies, market gardens, etc., 9,320,193 under forests, and 2,918,376 hectares put to various uses not included in any of the foregoing. The table below shows area and production of main crops for the two years last past (1912 final, 1913 provisional figures), with quintals produced per hectare in 1912:

	Hectares		Quintals		Qs. ha.
	1912	1913	1912	1913	
Wheat	6,571,580	6,543,550	90,991,500	87,833,200	13.8
Rye	1,201,630	1,197,200	12,382,200	13,555,350	10.3
Barley	759,630	764,910	11,014,200	10,940,200	14.5
Oats	3,981,980	3,998,830	51,541,600	54,338,150	12.9
Vines*	1,650,953	1,673,409	54,668,124	41,053,832	35.2
Tobacco	15,437	10,309	226,272	162,220	14.7
Beets†	255,170	231,028	72,221,045	60,300,910	283.0

* Production in hectoliters of wine. † For sugar.

There were reported under potatoes, in 1912, 1,497,750 hectares, producing 146,838,900 quintals (98 qs. to the ha.); in 1911, 1,559,130 ha., 127,747,300 qs. (81.93). Cider production 1912, 17,661,598; 1911, 22,439,938. Under all forage plants in 1911, including roots and grasses, annual and perennial, 15,271,830 hectares, yielding 709,963,000 quintals, valued at 3,517,472,000 francs. Under truck gardens, 291,420 ha., yielding produce valued at 567,222,000 francs. The wheat produced in 1911 was valued at 2,252,003,000 francs; oats, 1,042,468,400; potatoes, 1,130,647,420; wine, 1,338,141,144; sugar beets, 135,998,980; apples and pears for cider, 198,269,540; truck-garden produce, 440,994,000; forage beets, 337,373,380. Hay from natural meadows was valued at 1,268,423,640 francs; lucerne, 400,353,390; clover, 305,466,200; annuals planted for forage, 256,839,370; mixed grasses, 341,863,350; etc. Silk-worm eggs placed in 1912 for hatching, 33,133 hectograms; cocoons obtained, 6,233,942 kilograms; average yield of cocoons per hg. of eggs, 188.1 kg.

LIVESTOCK. Number of horse in the country in 1911, 3,236,160; mules, 194,000; asses, 360,590; cattle, 14,552,430 (7,606,670 cows, 1,821,560 steers, 390,940 bulls, 2,778,760 young stock, 1,954,500 calves); sheep, 16,425,330; swine, 6,719,570; goats, 1,424,180. Livestock census of December 31, 1912: 3,222,140; horses 196,410; mules, 358,660; asses, 14,705,900; cattle (7,745,750 cows, 2,842,710 young stock, 1,844,790

steers, 283,670 bulls, 1,988,980 calves), 16,467,700 sheep, 6,903,750 swine, 1,408,520 goats.

FISHERIES. Engaged in the maritime fisheries in 1909 were 29,876 boats, of 232,514 tons; their total value was 84,559,072 francs, and the value of their engines was 26,685,240 francs. Fishermen, 159,899; total value of output, 134,865,728 francs.

MINES AND FURNACES. The number of conceded mines in 1910 was 1483, covering 1,206,419 hectares. Of these, 557, covering 594,886 hectares, were in operation. Number of workers, 225,414 (161,329 underground, 64,085 at the surface). Output, 54,714,628 tons, valued at the pit's mouth at 682,869,802 francs; of which, coal and anthracite 37,634,893 tons, valued at 569,034,521 francs; iron ore 14,046,982 tons, 65,143,573 fr.; iron pyrites 250,432 tons, 4,269,498 fr.; lignite 715,049 tons, 7,222,471 fr.; gold ore 126,398 tons, 7,080,568 fr.; zinc ore 50,624 tons, 5,078,066 fr.; lead and silver ore 14,536 tons, 2,878,503 fr.; rock salt 765,617 tons, 10,597,361 fr.; sea salt 285,810 tons, 4,723,252 fr.; etc. The quarries employed 126,344 workers and produced 50,794,168 tons, valued at 261,151,200 francs.

Metal works in operation in 1910, 203; employing 98,902 workers and consuming 3,404,126 tons of coal, 4,693,749 of coke, and 10,250 of charcoal. Of these, 47 were smelting works, with 17,745 workers and output 4,038,300 tons, valued at 315,538,000 francs; 101 puddling works, with 16,345 workers and output 525,900 tons, valued at 96,836,000 francs; 95 steel works, with 64,812 workers, and output 2,323,500, valued at 480,700,000 fr.; 34 other, with 5462 workers, and output 100,325 tons, valued at 83,151,000 fr.; (fine gold, 458,000 fr.; platinum, 11,000 fr.; fine silver, 5,931,000 fr.; lead, 7,106,000; zinc, 29,687,000; copper, 19,672,000; nickel, 7,350,000; aluminum, 9,944,000; antimony, 2,542,000; manganese, 450,000.

OTHER INDUSTRIES. Number in 1910 of silk factories, 214; producing for the year 771,655,785 kilograms of spun silk; value of output of silk stuff, exclusive of ribbons, 471,297,000 fr. (414,777,000 fr. in 1911). Sugar factories (1910-11), 239; treating 5,512,429,084 kilograms of beets, and producing 650,487,730 kilograms of refined sugar. Distilleries in operation (1911), 13,713; output, 2,272,133 hectoliters pure alcohol; 676,200 hl. denatured alcohol.

COMMERCE. In the table below are given corrected figures for the 1911 special trade, and provisional figures for 1912 (A, foodstuffs; B, raw materials; C, manufactured articles and exports by parcels post); values in thousands of francs:

	Imports		Exports	
	1911	1912	1911	1912
A.....	2,020,000	1,693,200	736,900	847,700
B.....	4,625,300	4,652,100	1,830,100	1,935,000
C.....	1,520,500	1,605,600	3,509,900	3,853,700
Total....	8,065,800	7,950,900	6,076,900	6,636,400

Total general in 1911: 9,809,900,000 imports and 8,012,200,000 exports. A more detailed table follows for the two years, values in thousands of francs:

	Imports		Exports	
	1911	1912	1911	1912
Cereals....	715,100	344,400	9,830	13,900
Wines.....	301,500	305,700	187,700	225,900
Textiles....	1,694,900	1,787,400	635,200	677,200
Yarns.....	223,600	235,800	1,004,800	1,091,100
Other				
mdse....	5,130,700	5,277,600	4,239,400	4,628,300
Total....	8,065,800	7,950,900	6,076,900	6,636,400

Some of the principal articles of import and export in the 1912 table, with values in thousands of francs, appear below:

Imports	1000 fr.	Exports	1000 fr.
Cereals	715,100	Skins	249,300
Wool	628,200	Cottons	324,200
Cotton	558,700	Wool	223,600
Coal	453,600	Silk goods.....	292,000
Oil-seeds	371,700	Lingerie	197,700
Skins	355,000	Woolens	190,600
Slks	317,400	Wines	187,700
Wines	301,500	A. de P.*	183,400
Machinery	286,700	Auto's	162,400
Rubber	237,800	Slks	162,400
Timber	193,800	Rubber	156,900
Coffee	144,400	Cotton	120,300
Copper	143,300	Paper	119,800
Ores	113,400	Machinery	113,600
Flax	85,900	Metal wares	106,700
Jewelry	82,400	Novelties	87,200
Petroleum	81,400	Pottery, etc.	83,300
Dairy products..	81,100	Woolen yarn	75,200
Metal wares....	77,400	Leather goods... 75,000	
Crockery	76,700	Oils	73,900
Nitrate soda....	76,300	Jewelry	72,600
Paper	74,800	Rubber goods... 71,000	
Feathers	73,400	Table fruits.... 69,200	
Legumes	70,400	Dairy products.. 66,200	
Rice	67,500	Sugar	64,400
Animals	66,400	Timber	62,500
Rubber goods... 64,700		Plumes	59,600
Fish	63,300	Iron and steel.. 59,400	

* Articles de Paris.

Some of the principal countries of origin and destination in the 1911 trade (values in thousands of francs) are as follows: Great Britain, 994,200 imports and 1,219,200 exports; Germany, 979,700 and 794,600; United States, 826,800 and 379,700; Belgium, 542,600 and 1,024,200; Algeria, 425,600 and 489,900; Russia, 443,100 and 53,900; Argentina, 353,800 and 170,400; Spain, 230,500 and 135,600; Italy, 190,300 and 277,800; Brazil, 146,000 and 78,500; Switzerland, 140,200 and 394,000; Turkey, 101,600 and 81,300; China, 229,800 and 13,700; British India, 360,200 and 42,700; French Indo-China, 109,000 and 65,800; Netherlands, 140,700 and 65,000; Rumania, 175,100 and 10,700; Austria-Hungary, 87,800 and 46,400; Australia, 340,200 and 11,200.

SHIPPING. In 1911 there entered at the ports of France 28,183 vessels, of 29,867,016 aggregate tons, of which 7690 vessels, of 7,138,790 tons, were French. Cleared, 20,806 vessels, of 22,555,346 tons; French, 6946, of 6,623,511 tons. In 1912: 30,615 vessels, of 30,483,308 tons (8046, of 7,266,870 tons, French) entered; 31,013, of 30,882,743 (8244, of 7,478,433, French) cleared.

The merchant marine included, January 1, 1911, 17,621 vessels, of 1,451,648 tons (1726 steamers, of 815,567 tons); 1912, 17,729 vessels, of 1,462,639 tons (17,729 steamers, of 1,462,639 tons).

COMMUNICATIONS. At the end of 1912 there were in operation 40,927 kilometers of main railways and 10,261 kms. of local lines. Large

advances, accounting for a considerable proportion of the public debt, have been made by France to the railways, which will ultimately revert to the state. The leading items of interest for 1913, in connection with railway development in France, were the extension and development of lines crossing the borders. A 15½-mile cut-off, including the Mont d'Or tunnel of 3¾ miles, had been under construction since September, 1910, was nearing completion at the end of 1913, and was expected to be entirely completed in the ensuing year. The object of this line, which is being constructed by the Paris, Lyons, and Mediterranean Railway, was to shorten the route from Paris to Milan, via the Simplon tunnel, and the new Mont d'Or tunnel was being arranged for electric working. From Nice to Vivioia, Italy, a heavy line, 49 miles in length, was under construction, but its completion was not anticipated until 1915. This line was to have a 15-mile branch from Breil to Ventimiglia. Still another border line construction was that from Aix-les-Bains in France to Puigcerda and Ripoli in the province of Gerona in Spain. A feature of this line is a 3¾-mile tunnel. Another international line was that from Noguera to Pallaresca, where a tunnel nearly 5 miles long was being constructed through the Pyrenees. Telegraph lines (1911), 161,436 kms.; wires, 611,726; stations, 17,619 state and 3645 railway and private. Post offices, 14,379. Telephone lines: 48,049 kms. urban and 103,288 kms. interurban lines; wires, 965,385 and 522,251. There are 3104 miles of canals and 5472 miles of rivers utilized in internal navigation.

FINANCE. The franc, worth 19.3 cents, is the unit of value. Revenue and expenditure for three years are shown below in francs:

	1908	1909	1910
Revenue....	3,966,415,128	4,140,912,961	4,273,890,789
Exp'diture..	4,020,549,697	4,186,090,463	4,321,918,609

The 1912 budget estimated the revenue at 4,495,849,566 francs, and the expenditure at 4,497,963,139 francs. The budget for 1913, as voted July 30, 1913, estimated the revenue at 4,736,301,908 francs: 622,334,030 from direct taxes, 67,971,490 domains and forests, 2,548,755,235 indirect taxes, stamps, customs, etc.; 968,655,373 monopolies and revenue-earning enterprises; etc. Expenditure, 4,738,603,534 francs: 1,296,423,922 for service of the debt; 20,116,488 public services, 50,732,863 finance, 57,901,727 justice, 20,120,037 foreign affairs, 141,981,939 interior, 983,224,376 war, 488,941,062 marine, 330,918,486 instruction and fine arts, 58,519,962 commerce, industry, etc.; 106,669,353 labor, 105,535,363 colonies, 39,094,141 agriculture, 340,905,255 public works, 649,951,630 costs of administration and collection of taxes, 47,586,900 repayments. The "special services" budget balanced at 816,329,331 francs. The total of the public debt stood, January 1, 1912, at 31,162,001,387 francs, and the floating debt at 1,395,898,400.

ARMY. See section *History*, under *The Thres Year Law*, and *passim*. See also **MILITARY PROGRESS**.

NAVY. The number and displacement (built), December 1, 1911, of warships, of 1500 or more tons, and of torpedo craft of more than 50 tons, were as follows: 2 battleships (dreadnought type) having a main battery of all big guns (11

inches or more in calibre), of 46,184 tons (and 9 of 214,100 tons, building); 18 battleships (pre-dreadnought type) of (about) 10,000 or more tons displacement and with main batteries of more than one calibre of 262,675 tons; 1 coast-defense ship, of 8800 tons; 20 armored cruisers, of 201,724 tons; 10 cruisers (unarmored war ships of more than 1500 tons), of 49,978 tons; 81 torpedo-boat destroyers, of 34,386 tons (and 5 of 3974 tons, building); 139 torpedo boats, of 13,920 tons; 75 submarines, of 28,224 tons (and 18 of 12,190 tons, building). Total built, 346 vessels, of 645,891 tons; total building, 32, of 230,264 tons—in all, 378 vessels, of 876,155 tons. Excluded from the foregoing are ships over twenty years old, unless reconstructed and re-armed within five years; torpedo craft over fifteen years old; transports, colliers, repair ships, torpedo depot ships, and other auxiliaries. Air craft April 7, 1913, included 13 military dirigibles on hand and 7 ordered; and 450 military aeroplanes on hand, including monoplanes, biplanes, and hydro-aeroplanes. The two dreadnought-type battleships completed in 1913, the *Jean Bart* and the *Courbet*, were launched in 1911. The *Courbet* was the first French ship of this class to be completed, and she was the vessel that carried M. Poincaré on his presidential visit to England in June, 1913. In addition to the nine building, another vessel of this type is to be laid down early in 1915, to be called the *Vendée*. Two of those building, the *France* and the *Paris*, were launched in 1912 and will be completed during 1914; three others—the *Bretagne*, launched April 21, 1913; the *Provence*, April 20; and the *Lorraine*, September 30—will be completed in 1915. Of the remaining four, two were begun in May, 1913, and two in November; to be completed in 1916. They will exhibit a new departure in armament, in that their guns are to be mounted four in a turret. In three turrets they will carry twelve 13.4-inch guns, whereas earlier types had twin turrets. The chief advantages of the new method are said to be simplicity of plan, economy of weight, and concentration of fire. Three projected scout cruisers to have been begun 1919 have been forwarded to 1914. The destroyers building will use oil fuel and attain a speed of 31 knots. The largest of the new submarines, the *Gustave Zédé*, has a displacement of 1000 tons submerged, and 800 tons when at the surface. She was launched May 20, 1913.

It is in the Mediterranean that the main fleet is stationed, under Vice-Admiral Boué de Lapeyrière. Three armored cruisers and torpedo and submarine flotillas lie in the English Channel.

The minister of marine (M. Baudin, succeeding M. Delcassé January, 1913) is the head of the navy, and acts as president of the council of admiralty, established September 7, 1913—an executive body with powers similar to those of the British board of admiralty. The navy is manned partly by conscription and partly by voluntary service. The personnel in 1913 comprehended 63,859 officers and men (60,621 in 1912, and 58,404 in 1911), including 15 vice-admirals, 30 rear admirals, 360 captains and commanders, and 1457 other line officers. France ranks fourth among the nations (the United Kingdom, Germany, the United States) in the amount of warship tonnage built, and also in the aggregate of tonnage built and building.

See also BATTLESHIPS, and NAVAL PROGRESS.

GOVERNMENT. The republic was proclaimed September 4, 1870. The constitution is that of February 24, 1875, amended August 2 and November 30, 1875, December 9, 1884, June 16, 1885. Two chambers compose the National Assembly, which convenes annually. Three hundred members, aged not less than forty years and elected by delegates for nine years, make up the Senate. There remained in 1912 only three of the life members elected by the Assembly previous to the introduction of the present system. The members (597; one to every 70,000 inhabitants) of the Chamber of Deputies are elected for four years by direct popular vote. The president (1906-1913, Clément-Armand Fallières) is elected for seven years per the Assembly, by an absolute majority of votes. His cabinet, responsible to the legislative body, is chosen by himself; in the majority of cases it is made up from members of one or other of the two chambers, but not necessarily so.

HISTORY

THE PATY DU CLAM INCIDENT. The beginning of the new year witnessed a revival of the animosities which had embittered the famous Dreyfus case of 1894. The affair was again brought to the attention of the public by the announcement that Col. Paty du Clam—notorious for his part in the prosecution of Captain Dreyfus—was about to be reinstated in the army by order of the minister of war, M. Millerand. A great hue and cry was raised; with vehement denunciations the opponents of the government attacked what seemed to be an attempt to rehabilitate the now discredited colonel. M. Millerand might explain that his act was without political significance, that the place had been promised to Col. Paty du Clam by a previous minister of war; but he explained in vain. The blunder cost him his portfolio; the Poincaré ministry, however, was not unseated. It allowed M. Millerand to shoulder all the blame. On January 11, M. Millerand sent in his resignation, assuring M. Poincaré that it was pleasant "to have been closely associated in the national and republican endeavors" of the cabinet. M. Lebrun, minister of colonies, was transferred to war; and M. Besnard filled the post vacated by M. Lebrun.

THE PRESIDENTIAL ELECTION. On January 14 the chambers met again. After the election of M. Deschanel as president of the Deputies and of M. Antonin Dubost as president of the Senate, the first important business was the election of a president of the republic for the term 1913-1920 to succeed M. Armand Fallières. The preliminary caucus was of more than ordinary interest and excitement. The rivalry was indeed not between parties, as in the United States, but between personalities. True, the revolutionary Socialist, M. Vaillant, represented a partisan issue; but he was hopelessly out of the race, and the two leading candidates were both members of the cabinet, M. Poincaré and M. Pams being respectively president of the council and minister of agriculture. Other aspirants to the presidency—M. Ribot, M. Dubost, M. Deschanel, M. Dupuy—dropped out during the caucus: M. Dubost in favor of M. Pams, and M. Ribot to benefit M. Poincaré. M. Pams then led with 323 votes as against 309 of M. Poincaré. The strength of M. Pams was surprising, considering the fact that he—prosperous bour-

geois, inconspicuous senator, and subordinate in the cabinet—had entered the campaign late and could hardly compare in prestige, experience, and manifest ability with M. Poincaré. M. Pams was strongly supported by a group of Radicals—MM. Clémenceau, Combes, Monis, Caillaux, and Clémentel—who presumably were anxious to keep M. Poincaré, with his strong personality, his decided views on foreign relations, finance, and proportional representation, out of the supreme magistracy. A delegation including the five above-named politicians attempted to dissuade M. Poincaré from entering the contest; and quite naturally, M. Poincaré refused to withdraw. On the following day, January 17, the elections were held, in accordance with the constitutional provision that the president shall be elected for seven years by an absolute majority of the Chamber and Senate sitting in joint session at Versailles. On the first ballot no absolute majority was obtained, M. Poincaré with 429 votes falling short by four, and M. Pams receiving only 327. On the second ballot 34 supporters of MM. Deschanel and Ribot, and almost as many of M. Pams's adherents, contributed to give M. Poincaré an absolute majority. The vote stood: For M. Poincaré, 483; for M. Pams, 296; for M. Vaillant, 69; for others, 11; total 859, not voting 11. President-elect Poincaré immediately resigned his post as president of the council, which was taken by M. Briand; but a month elapsed before he took office. On February 18 he was received at the *Elysée* by M. Fallières, and formally inaugurated. As a matter of form, M. Briand tendered the resignation of his ministry, but was retained by the new president.

PRESIDENT POINCARÉ. The election of M. Raymond Poincaré was heralded throughout the country and the continent as a victory of nationalism; for M. Poincaré has ever been a firm patriot and a supporter of the Triple Entente, of a progressive radicalism as opposed to the morbid anti-clericalism of MM. Combes and Clémenceau; of a vigorous but not jingoistic military policy. Russia especially was pleased and manifested gratification by the telegram of Czar Nicholas II. to M. Poincaré, "The bonds which unite France and Russia will draw still closer for the greatest good of the two allied and friendly nations." In England and in Spain there was jubilation also, but in Italy unpleasant comments were passed. In France there was a premonition that the new president, a politician in his prime, would not readily consent to abandon the rôle of statesman for that of dignitary. The confirmation came speedily, even in the presidential address. For the first subject dealt with in that document, after the customary promise of loyalty to the constitution, was the scope of the powers of the presidency. "The prerogative of parliament will easily be reconciled with the rights and duties of the government: and the lessening of the executive power is desired by neither chambers nor country. Without a firm and clear-sighted executive power the welfare of the administration would soon be endangered, and at times the public peace might even be menaced." The president of the republic should become a more trusted and a more important magistrate. In the light of this expanded conception of the presidential office, the policies enunciated by M. Poincaré were of real political significance. In a general way, social legislation was to be continued, and in

this direction the republic "sees before it an unlimited field of social ameliorations and aspirations." Electoral reform, left suspended between Senate and Chamber by the Poincaré ministry, was to be carried through so as to secure "in the perfection of electoral methods, as sincere and exact an expression of the popular will as possible." No less important was the strengthening of national defenses. "It is not possible for a people to be efficaciously pacific except on the condition of being always ready for war. A France diminished, a France exposed by her own fault to challenges and humiliations, would no longer be *la France*." "It would be committing a crime against civilization to let our country decline in the midst of so many nations which are ceaselessly developing their military forces." "Our army and our navy give us proofs of their devotion and valor every day. Let us devote our vigilant consideration to them, and halt not at any effort, at any sacrifice, to consolidate and strengthen them." Statements such as these made it very clear that, although he would have no direct influence upon legislation, the president would not be a dispassionate observer of parliamentary debates.

During the year M. Poincaré, already well and widely liked, became extremely popular. In the autumn his tour through the country and his visits to numerous large cities were attended by such enthusiastic popular demonstrations as to be likened to triumphal processions. Almost royal deference was paid him—in one place he was honored by a guild as only kings had been before. But in one or two towns the president was not welcomed, because his emphasis on defense had antagonized Socialist municipal authorities.

THE BRIAND CABINET. The immediate consequence of M. Poincaré's election to the presidency was the resignation of the old ministry. On January 18 M. Briand was asked to form a new cabinet. Within three days M. Briand had formed his ministry as follows: President of the council and interior, M. Briand; justice, M. Barthou; public instruction, M. Steeg; war, M. Etienne; marine, M. Baudin; foreign affairs, M. Jonnart; finance, M. Klotz; colonies, M. Jean Morel; agriculture, M. Fernand David; commerce, M. Guist'hau; public works, M. Jean Dupuy; labor, M. René Besnard. The ministerial declaration read January 24 emphasized especially electoral reform, the income tax, the reform of the *conseils du guerre*, and military defense, and promised legislation to give workmen greater liberty of general organization, and the modification of the trade-unions law of 1884 by the inclusion of the right of property. Following the reading of the declaration in the chamber, a vote of confidence received 324 affirmatives. M. Briand then devoted himself to the most important task of defending electoral reform before the Senate.

ELECTORAL REFORM. The electoral reform bill passed by the Chamber July 10, 1912, was considered by a committee of the Senate in February, 1913. The bill provided—as noted in the *YEAR BOOK* of 1912—for departmental *scrutin de liste* with representation of minorities, i.e. a compromise between proportional representation and the small-district majority system. The committee was hostile from the outset, and unalterably opposed to the representation of minorities. Instead, it proposed to replace the present *scrutin d'arrondissement* by a *scrutin*

de liste, with majority-rule applied to electoral colleges, each of which would elect 3, 4, or 5 deputies. The discussion of the committee report on electoral reform was begun in the Senate on March 13. The opposition to proportional representation was particularly bitter; M. Maxime Lecomte going so far as to call proportional representation a machine of war directed against the republic. This seemed to be the attitude in general of the followers of M. Combes and of M. Clémenceau, and it was early apparent that the reform would be wrecked by an anti-clerical Radical-Socialist combination.

The crisis came on March 18. M. Briand pleaded the cause of electoral reform for two full hours in the tribune of the Senate. He made it clear that proportional representation was not unrepugnant, that MM. Monis, Caillaux, and Combes had admitted the justice of it. And then he went on to explain the danger of the purely negative course adopted by the Senate commission, and implored the Senate not to break with the Chamber—for should the Senate reject the Chamber's bill, it would mean a deadlock. "Thirty-four times the electors have declared themselves in favor of proportional representation; twelve times they have declared in favor of the representation of minorities;" and it would not do now to refuse them. M. Briand was answered by M. Clémenceau, the "cabinet-breaker." M. Clémenceau feared that the Republican majority would be endangered by representation of minorities and insisted on majority rule. The Senate then proceeded to consider article I., "The members of the Chamber shall be elected by *scrutin de liste*"; to which M. Peytral had offered the amendment: "According to majority rule, no candidate being elected who shall have fewer votes than his competitors." This amendment, M. Briand declared, would preclude the possibility of compromise and conciliation with the Chamber, and would mean the resignation of the ministry. Heedless of the warning the Senate approved the amendment by 161 to 128 (with 11 abstentions). It is interesting to analyze the vote: the Democratic Left gave 130 ayes (against M. Briand) and 28 noes; the Republican Union gave 23 ayes and 25 noes; the Republican Left gave 1 aye and 35 noes; 6 independents voted aye and 16 no; and 23 of the 24 votes of the Right were against the amendment. M. Briand was overthrown by over three-fourths of the Democratic Left coöperating with half of the Republican Union. That evening the president of the council resigned. Electoral reform had been defeated, for the time being.

THE BARTHOU CABINET. M. Barthou, the successor of M. Briand, was looked upon as an emergency-man to put through military reforms, without a permanent policy. He selected a ministry in which there were 5 members of the Democratic Left, 2 of the Republican Union, 4 of the Radical-Socialist group, 1 of the Republican-Socialist, and 4 of the Radical Left. The portfolios were distributed as follows: President of the council and public instruction, M. Louis Barthou; justice, M. Ratier; foreign affairs, M. S. Pichon; interior, M. Klotz; war, M. Eugene Etienne; marine, M. Pierre Baudin; finance, M. Charles Dumont; public works, M. Thierry; commerce, M. Massé; agriculture, M. Clémentel; colonies, M. Jean Morel; labor, M. Henri Chéron. It will be observed that five

members of the Briand cabinet had been carried over. The ministerial declaration, read on March 25, gave first place to national defense and the three-year bill. An attempt would be made to reconcile representation of minorities with the principle of majority rule. The ministry would insist upon the adoption of measures for school-attendance and for the protection of the lay school "against outrages, campaigns, and manœuvres which are becoming more and more intolerable." The income tax was incorporated in the ministerial programme. In foreign affairs, the ministry would seek the pacific regulation of the Balkan conflict. The declaration was poorly received in the Chamber; criticisms were numerous, and M. Barthou was interrogated until he admitted that he would accept electoral reform with representation of minorities, but without the quotient. The vote of confidence was alarmingly slender: 225 and 162, and almost 200 abstentions.

A month's adjournment of the Assembly gave the political atmosphere a little time to cool. When the session was reopened on May 6 the army bill became the centre of attention.

THE THREE-YEAR LAW. Among the various measures for military reorganization included in the army bill, by far the most important was the return to three-year service. That for the augmentation of the effective army it was necessary to exact three years of active service from all Frenchmen, without exemption, was the opinion unanimously expressed by the Superior Council of War on March 4, 1913. Two days later M. Etienne, minister of war, laid a three-year-service bill on the table in the Chamber, in the face of tumultuous opposition on the part of the Socialists. The project received speedy commendation from the municipal council of Paris (March 7), was incorporated in the programme of M. Barthou, and was adopted by the army committee of the Chamber on May 9.

Against the bill M. Caillaux for a Radical group, and M. Jaurès for the Socialists, led repeated and violent attacks. (See also **SOCIALISM**.) Three-years service would be costly, they said, to the state as well as to the poorer recruits, and it would be worse than useless. As a "nation in arms" France could defend herself; the augmented standing army was a burden and a danger to the republic. But M. Caillaux and M. Jaurès could not command a majority; they could only obstruct the bill by offering amendments and counter-projects. On June 26 M. Barthou exhorted the Chamber not to let politics interfere with the fulfillment of a "national duty," but possibly the plea had been heard too often; at any rate, it failed to prevent the presentation of still more counter-projects. On July 7 the government consented to an amendment voted by the Chamber to require equal service from all, not even excepting the heads of large families; and on July 8 the three-year law, article 18 of the military law, was voted by 344 to 220. Then a proposal to enlist recruits at the age of 20 was considered, and after an acrimonious discussion, passed on July 16, 376 to 199. Finally, at midnight on July 19, the entire military law was passed by the Chamber by 358 votes against 204, M. Caillaux protesting in the name of the "noes."

The Senate began to discuss three-year service on July 31, and approved it on August 5. Despite a lively debate, M. Clémenceau was unable

to prevent the passage of article 6, which provided for enlistment at 20 years. Article 12 also met with unsuccessful opposition, some of the senators thinking that the financial assistance given to the needy families of recruits was too generous, since it would cost the state 60,000,000 francs a year. Other objections were forestalled by a promise that a supplementary bill would later be brought in to rectify and complete the bill as at present formulated. The Senate then voted the whole of the military law by 254 to 37 on August 7, and on the following day the session ended.

The principal provisions of the law of August 7 were: (1) Every healthy male French citizen shall serve 3 years in the active army, 11 years in the reserve, 7 years in the territorial army, 7 years in the territorial reserve—in all 28 years instead of 25 as hitherto required. (2) A medical commission shall pass on the physical fitness of recruits. (3) For the support of the families of soldiers an allocation of 1 fr. 25 per diem shall be made, plus an additional fr. 50 for each child. (4) Although no exemptions are made—except in the case of invalids—students and apprentices may obtain a postponement of their term of service, and physicians, pharmacists, and veterinaries may serve two of the three years in their professional capacities rather than as common soldiers. (5) Students in the *École Polytechnique*, in the *École de Saint-Cyr*, and in the *Écoles du Service de santé* at Lyons and at Bordeaux, are required to spend two months in actual military manoeuvres after the first year of study, and as non-commissioned officers after the second. They agree to spend 8 years in the service of the state, or else perform 2 years of service as sub-lieutenants of the reserve, after graduation. (6) Students in non-military institutions must serve three years but may enlist at the age of 18 or postpone enlistment until after graduation. (7) Recruits will ordinarily be incorporated in the army at the age of 20. (8) The number of absentees must never exceed 10 per cent. of the legally-determined effective force. (9) The law does not apply to the classes of 1910, 1911, or 1912 (called in October, 1913). Another measure passed during the year restricted the jurisdiction of military tribunals (*conseils de guerre*) to military offenses and reformed the procedure.

The effect of the new law was to increase the effectives by 170,000 and to make possible an extensive reorganization of the army, with the creation of new units and an augmented peace strength estimated at 673,000; the non-recurring cost was placed at 725,000,000 francs and the increase in the annual expenditure at 170,000,000 francs. This additional strain on the already overburdened treasury was sharply criticised in the legislature; but more alarming were the manifestations of disapproval in the country at large. On March 15 at Paris, on May 18 at Paris, Toul, Belfort, Macon, Orleans, Rodez, Bourges, Nancy, Lérrouville, and Rennes, at Paris on May 25, on July 13, on August 17, and on August 23, crowds met to shout "*à bas l'armée*," or soldiers mutinously protested against the third year of service. A communist and anarchist congress discussed the general strike as a possible means of combatting militarism. These and similar outbreaks were sternly suppressed as unpatriotic.

THE FALL OF BARTHOU. The three months of political inaction from August 7 to November 4 were interrupted by an event of primary importance. On October 16 a Radical and Radical-Socialist congress met at Pau to plan the overthrow of the Barthou cabinet. A considerable portion of the old Radical bloc in the Chamber, supported by M. Clémenceau and the Radicals of the Senate, had assumed an antagonistic attitude toward the last three ministries—those of MM. Poincaré, Briand, and Barthou;—they had opposed M. Poincaré's candidature in the presidential elections; they had wrecked M. Briand's electoral reform bill; and they planned now to destroy M. Barthou. Aside from personal rivalries, which play no inconsiderable part in French politics, there were three large issues between the Poincaré-Briand-Barthou policies and the sentiments of the congress of Pau. First and foremost was the question of anti-clericalism: the Pau congress was almost rabidly anti-clerical and had no patience with M. Briand's conciliatory tendency, with M. Poincaré's electoral reform (which might increase to clerical at the expense of the Radical representation), or with M. Barthou's tolerant attitude towards free schools. M. Barthou, it should be observed, subsequently declared before a banquet of the Educational League that the abolition of the free (Catholic) schools would be a blow to education, and that the need of "defending" the lay school was much exaggerated. The second point was the three-year law, vigorously opposed and derided by the Pau congress. The third measure at stake was the income tax; for although the present government had committed itself to the principle of a tax on incomes, the politicians assembled at Pau desired its immediate introduction. They therefore disowned and excommunicated the Radical ministers, and elected ex-Premier Caillaux to be president of the executive committee of the group, which now became known as the Unified Radical party. In outlining the policy of the new Radical-Socialist coalition, M. Caillaux demanded (1) a return to two-year service; (2) *défense laïque* (legislation against religious schools), and (3) an income tax. As leader of the Unified Radicals, M. Caillaux returned to redouble his attacks on the cabinet in the extraordinary session which opened on November 4.

M. Barthou was in no enviable position. He had strengthened the army, and had now to bear the taunts and reproaches of anti-militarists. He had promised to find a compromise on electoral reform that would suit both Chamber and Senate, a task well-nigh impossible. The Chamber was insistent and the Senate hostile; in the effort to conciliate both he allowed the *scrutin de liste* with representation of minorities to be hopelessly modified and mutilated in a new electoral reform bill. The size of the Chamber would be considerably reduced by fixing the ratio of representation at one deputy to 22,500 registered voters, and an equilibrium between proportional representation and majority rule was arrived at by means of a complicated scheme involving two different *scrutins*. Notwithstanding its defects, the bill commanded a majority of 108 in the Chamber and was presented to the Senate in November.

Meanwhile M. Barthou was encountering still greater difficulties in finance. The budget of

1913 had been passed on July 30 after many months of wrangling, during which time it had been passed back and forth between Chamber and Senate until it had become the laughing-stock of the press. The expenditure, amounting to more than 4,700,000,000 francs, was covered only by resorting to a variety of extraordinary expedients. For the new budget, the budget of 1914, no such devices were available. The sources of revenue were actually smaller, so that while the augmentation of expenditure amounted to 681,000,000 francs, the deficit reached the figure 794,000,000 francs. Eight hundred millions had to be obtained by new taxation or by loan. The latter was decided upon by M. Barthou, despite his repeated promises that the increased expense of the army should be paid by the rich, and the Chamber was asked to ratify an internal loan of 1,300,000,000 francs, of which 400,000,000 were charged to the "pacification" of Morocco. As might have been expected, the Socialist M. Jaurès attacked the project and arraigned the whole military and Moroccan policies of the government. It was not on the loan itself, but on the manner of issuing it, that M. Barthou met his defeat. In an inadvised moment he made a question of confidence of an amendment that the interest (*rente*) on the new bonds should be forever exempt from taxation; and justified his stand on the grounds that taxation of the *rentes* would lower the market price of the new securities, that exemption would benefit the thrifty middle-class *rentiers*, and that many other countries exempted government bonds from taxation. The explanation was insufficient to withstand the attacks of M. Caillaux, however, and in the vote on the amendment the government was defeated by a negative majority of 25. The Barthou cabinet immediately resigned, December 2.

THE DOUMERGUE MINISTRY. After attempting in vain to induce M. Ribot or M. Dupuy to form a ministry, President Poincaré turned to the Unified Radical group. M. Caillaux should have been the chief of the new cabinet, had he not still retained some of the unpopularity earned in 1911; he was therefore content with the portfolio of finance. M. Gaston Doumergue, senator for Gard, who had served in the ministries of MM. Combes, Sarrien, Clémenceau, and Briand (1909), was chosen as the nominal head of the government, but his dependence on M. Caillaux and upon M. Clémenceau was no secret. The portfolios were distributed as follows: Foreign affairs, Gaston Doumergue (Democratic Left of Senate); finance, Joseph Caillaux (Unified Radical of Chamber); education, René Viviani (Republican Socialist of C.); commerce, L. J. Malvy (Un. Rad. of C.); war, Joseph Noulens (Un. Rad. of C.); public works, Fernand David (Radical of C.); justice, Bienvenu Martin (Radical of S.); marine, Ernest Monis (Radical-Socialist of S.); colonies, Albert Lebrun (Democratic Left of C.); interior, René Renoult (Un. Rad. of C.); agriculture, Maurice Raynaud (Un. Rad. of C.); labor, Albert Métin (Un. Rad. of C.). It will be noticed that while the combination is dominated by the new Unified Radical party, and represents the tendency of the anti-clerical elements of the *blocc* to coöperate with the Socialists, it is nevertheless strangely discordant on the question of militarism. The Unified Radicals led by MM. Cail-

laux and Malvy had demanded a return to two-year service; in the Senate, however, MM. Doumergue and Monis had voted for the army law, and M. Clémenceau, whose powerful influence over the Doumergue cabinet was generally acknowledged, was an ardent champion of three-year service. The reversal of the army law was therefore improbable. On the question of electoral reform, and on exempting the *rentes*, all but two of the ministers had voted in the negative. In their attitude towards the Catholic or free schools, all were strongly anti-clerical. If we look at the new governing group as an anti-clerical combination of the militarist Clémenceau and the anti-militarist Caillaux, it is not difficult to understand how the declaration of policy should be emphatic on *la défense laïque* while vague on other subjects, and should impotently recognize the army law and promise loyally to apply it—although the congress of Pau had demanded a return to two years' service. The ministers had been opposed to electoral reform; but presently at the urgent instance of the Chamber they agreed to push the electoral reform bill in the Senate. On the question of the income tax they adhered to their principles. M. Caillaux announced that the loan project would be dropped, and an income-tax bill was passed by the Chamber and presented to the Senate. Finally, the ministry took up the question of education. Ever since March the Chamber had carried on a futile discussion of the falling off in school attendance, and of measures for remedying it, and some lively debates had been occasioned by proposals for restraining the competition of private ("free") schools with public ("lay") schools. These proposals were now infused with new life and an education bill rapidly took shape. Article 21, passed by the Chamber in the middle of December by 367 to 188, imposed fines and imprisonment as penalties for using threats to keep children from attending *lay* schools and from using the prescribed text-books. Needless to say, the measure was bitterly assailed as an exceptional law, inasmuch as it laid no penalty on the use of threats and menaces to deter parents from sending their children to free (i.e. Catholic) schools.

THE BRIANDISTS. Perhaps the most formidable critic of the new régime was M. Aristide Briand. Speaking at St. Etienne, M. Briand exposed the inconsistencies of the Unified Radical cabinet; it was attempting to revive anti-clerical fanaticism, he said, and diverting attention from the true needs of the republic, viz., a firm foreign policy, a strong army, and social legislation. Late in December it was reported that M. Briand had induced over a hundred senators and deputies, including MM. Barthou, Pichon, Klotz, Millerand, and Dupuy, to form a new group—the Democratic Entente—with patriotism and social betterment as watchwords and the Unified Radicals as enemies.

FOREIGN AFFAIRS. The Dual Alliance might well have been weakened by the strain which the Balkan War placed upon international relations, had not there been at St. Petersburg an able and loyal defender of the Franco-Russian alliance. On February 20 M. Delcassé was named ambassador to Russia by M. Poincaré, to the great pleasure of all advocates of the Entente Cordiale. A less favorable impression was created by the establishment of the

Doumergue cabinet, with M. Doumergue as minister of foreign affairs, inasmuch as he and his associates were not ardent Russophiles. King Constantine of Greece visited Paris in September and was received at the Elysée by M. Poincaré. The king of the Hellenes was none too cordially welcomed after his tactless eulogy on German military methods (see GERMANY, *Foreign Affairs*), and although he praised the military mission of the French general Eydoux, the French press could not entirely forgive him. The jealousy exhibited in this case was but one manifestation of the ill-feeling between France and Germany. During the year both nations increased their armies; in both parliaments patriotic orators alluded to the enemy across the Vosges; and in both countries the press was ready to make much of slight annoyances. The suppression of the *Souvenir Alsacien-Lorrain* again brought the Alsatian question into prominence. This and the later Zaberne, or Saverne, incident are treated under GERMANY. There were besides, several vexatious occurrences on the Franco-German frontier. On April 14 three Germans were insulted by French students at Nancy. The French government promptly investigated the matter and removed several officials for not protecting the Germans from affront. On April 22 a German military biplane landed inside the French frontier at Arracourt, and again a German dirigible trespassed on French territory. In order to prevent such accidents, M. Jules Cambon, the French ambassador at Berlin—who, by the way, resigned in December—called the attention of the German government to the inconveniences arising from the too frequent descent of foreign airships on French soil. It was hoped that more amicable relations might be cultivated by the Franco-German Interparliamentary Conference held at Bern on May 11 at the invitation of Swiss politicians. There were present 144 French, but only 44 German parliamentarians, and these mostly Socialists. Not much was accomplished, however, beyond the formation of personal friendships and the adoption of a resolution in favor of peace, friendship, and smaller armies. The Franco-Spanish treaty relative to Morocco, discussed in a previous YEAR BOOK, was unanimously approved by the French Chamber on March 7, and by the Senate on March 29. For a discussion of the drawing together of France and Spain, see SPAIN.

MISCELLANEOUS. After passing the three-year military service law, the Senate, fearing that the production of coal would fall off, amended the miners' eight-hour bill—to allow each miner to work 150 instead of 30 hours overtime per annum. The miners of northeastern France thereupon went out on strike; but were induced to return to work by promises of increased pay.—A large bell was presented by the Pope to the Cathedral of Rouen in honor of Jean of Arc.—In protest against the closing of religious schools, five bishops of Brittany issued a notable justification of Catholic education.—A disastrous railway accident at Melun on November 4 caused the death of thirty-two persons. FRENCH, ANNE (WABNER). An American author, died February 4, 1913. She was born in St. Paul, Minn., in 1869. In 1888 she married Charles Ellis French. Her first published work, *A Woman's Will*, appeared in 1904. In the same year she wrote *Susan Clegg and Her Neighbor, Mrs. Lathrop*. During the next five years she wrote: *Susan Clegg and Her Neighbor's Affairs*; *Seeing France with Uncle John*; *Susan Clegg and a Man in the House*; *Seeing England with Uncle John*; *An Original Gentleman*; *In a Mysterious Way*; and *Your Child and Mine*. The last years of her life were spent at Marnhull, Dorset, England.

FRENCH ACADEMY. See ACADEMY, FRENCH.

FRENCH EQUATORIAL AFRICA (formerly FRENCH CONGO). A French possession on the west coast of equatorial Africa, made up of the Gabun Colony (capital Libreville), the Middle Congo Colony (capital Brazzaville), and the Ubangi-Shari-Chad Colony (capital Fort-de-Possel). The present area and population (1906), after deduction of 280,000 square kilometers, carrying a population of about a million, ceded to Germany following the convention of March 4, 1912, is officially given as 1,453,888 sq. kilometers and 9,000,000 inhabitants (a density of 7.8 to the sq. kil.). This takes into account the territory ceded to France by Germany from the Kamerun country. Gold, copper, and iron exist in commercial quantities. In 1910 there were 6 copper mines in operation, covering 14,500 hectares; output, 1600 kg. valued at 553,825 fr. The agricultural products and exports are rubber, cacao, palm kernels and oil, timber, kola nuts, piassava, coffee, manioc, etc. The total imports for the year 1911 were valued at 17,924,084 francs; of which goods to the value of 7,602,641 fr. came from France, 100,119 fr. from French colonies, and 60,221,324 fr. from other countries. The exports amounted to 29,115,389 francs, goods to the value of 14,093,486 fr. going to France, 493 fr. to French colonies, and 15,021,410 fr. to other countries. Total vessels entered (Gabun) in the 1910 trade, 88, of 168,566 tons (18, of 42,805 tons, French). Libreville and Loango are the chief ports. The 1909 general budget balanced at 6,137,000 francs; debt, Jan. 1, 1912, 14,784,216 fr. Post offices, 33. Telegraph lines, 2023 kilometers; wires, 2175 ks. Commissioner-general in 1913, M. Merlin (M. Nix, acting).

FRENCH ESTABLISHMENTS IN OCEANIA. A French colony in the southern Pacific, composed of widely-scattered groups and single islands. Area, 3065 sq. kilometers (Tahiti and Moorea, 1175, with 13,255 inhabitants; Tumamotu Islands, 860 and 3828; Gambier Islands, 30 and 1533; Marquise Sous-le-Vent, and other islands, 1000 and 11,947); total population, 30,563. Capital, Papeete (3617 inhabitants), on Tahiti. Imports (1911), 7,206,650 francs; exports, 7,519,119. Vessels entered (1910), 54, of 117,705 tons. Debt, Jan-

uary 1, 1912, 60,784 francs. Governor in 1913, W. M. Fawtier.

FRENCH GUIANA (CAYENNE). A French colony and penal settlement on the northern coast of South America. Capital and only seaport, Cayenne, with (1906) 12,426 inhabitants. Area, 88,240 sq. kilometers; population (March 5, 1911), 49,009 (a density of 0.6 to the sq. km.). The people are chiefly engaged in placer gold-mining. Imports (1911), 11,263,329 francs; exports, 11,903,627. Vessels entered (1910), 53, of 49,645 tons. F. E. Leveque was governor in 1913.

FRENCH GUINEA. A colony of French West Africa (q.v. for area, population, etc.). The lower regions, plentifully watered by streams descending from the Futa-Jallon, are exceedingly fertile and luxuriantly overgrown. Eastward sandy plateaux upon a granite substratum arise into the ranges of the Futa-Jallon—that home of contrast, caprice, and mystery, broken by smiling valleys, frowned on by naked peaks. A variety of mixed races inhabit this country. The Fullah descendants of the conquering Peuhl number about 650,000; they are socially organized under a head exercising spiritual and limited temporal power, and proselyte the propaganda of Islam by fire and sword. They are good herdsmen but disdain agriculture. The Kissiens (about 120,000) are timid, of small stature, fetishists, and practice agriculture; the Timénés (30,000) and allied groups are mainly fetishistic, quarrelsome, and degraded (the Bagas present a curious appearance, with ears growing near the tops of their heads). Less intelligent than the Fullahs, the Malinkés (about 500,000) are an industrious and prosperous race. The Soussons, or Diallonkés (385,000) are the superior of all the indigenous peoples in mentality; they are fetishists but Islam has made great progress among them. The natives manufacture apparel, rush mats, dressed leather, pottery, arms, and jewels. Rubber, palm nuts, and gums are gathered; and cultivation produces rice, millet, manioc, sesame, etc. Stock-raising is practiced on a large and scientific scale, notably by Fullah tribes. The mineral resources are as yet unascertained. The total imports for 1911 were valued at 18,337,307 francs and the exports at 19,610,656 (rubber, 15,311,685 fr.; live animals, 1,098,869; hides, 1,054,402; palm nuts, 965,298; gum copal, 270,005). Vessels entered (1910), 682, of 615,911 tons. A railway (588 kilometers) runs from Conakry to Kourassa on the Niger; open since January 1, 1911. Conakry, the capital, has 6623 inhabitants; Kankan, 7120; Boké, 3527; Kindia, 2280; Dubreka, 1195. The lieutenant-governor in 1913 was J. Peuvergne.

FRENCH INDIA. Five French dependencies in India. Area, 513 sq. kilometers; population (March 5, 1911), 282,472—a density of 550 to the sq. km. The towns are Pondichéry (the capital), Karikal, Mahé, Chandernagar, and Yanam. Imports (1911), 8,618,302 francs; exports, 37,988,286 (oil seeds, raw cotton, pulse, etc.). Vessels entered (1910), 42, of 107,370 tons. The 1909 budget balanced at 2,725,000 francs. Debt, January 1, 1912, 4,684,392 francs. There are 30 kilometers of railway. Post offices, 5. Governor in 1913, A. A. Martneau.

FRENCH INDO-CHINA. A French dependency in southeastern Asia, composed of five states and a strip of territory leased from China

detailed in the table below (population according to the census of March 5, 1911); D= density; Kwangchow-Wan is the leased territory.

	Sq. kms.	Pop.	D.
Annam	159,890	5,542,822	35.0
Cambodia	175,450	1,487,948	8.0
Cochin-China	56,965	3,050,785	54.0
Laos	290,000	631,839	2.0
Tongking	119,750	6,117,954	51.0
Kwangchow-Wan	1,000	158,881	159.0
Total	*803,055	16,990,229	21.0

* 310,060 square miles.

The capital is Hanoi (in Tongking), with 113,676 inhabitants. Population (1911) of Cholon, 191,655; Bin-Dinh, 75,000; Saigon, 64,845; Pnom-Penh, 54,621; Hué, 50,000; Vien-tiane, 20,000; Haiphong, 27,000. The population includes Malays, Chams, Khmers (Cambodians), Annamites, Thais, and Chinese. Trade returns are for the colony as a unit, and are shown below in francs for three years:

	1909	1910	1911
Imports	249,753,677	238,686,288	244,142,680
Exports	273,034,618	290,546,912	250,146,499

Of the total imports, goods valued at 85,866,056 francs came from France, and at 6,986,460 from French colonies; of the exports, goods valued at 59,250,754 francs went to France, and at 1,939,012 to French possessions. The principal articles of export in the 1911 trade were rice, 117,470,000 francs; tin, 24,486,000; dried and salt fish, 12,556,000; corn, 9,704,000; hides, 7,997,000; cotton yarn, 7,824,000; coal, 6,579,000; pepper, 3,795,000; zinc ore, 3,739,000; live animals, 3,450,000; silver ingots, 3,027,000; cement, 2,829,000; cinnamon, 2,234,000; raw silk, 2,031,000. Vessels entered (1910), 2073, of 2,110,141 tons. The Saigon-Mytho Railway has an extension under way to Cantho. Total railways in 1912, 1909 kilometers, including 467 kilometers in the Chinese province of Yunnan. The general 1912 budget was estimated to balance at 38,317,000 piasters. The debt stood, January 1, 1912, at 245,912,509 francs. The governor-general in 1913 was A. Sarraut.

HISTORY. An important step towards local self-government was taken in 1913. Native councils with advisory powers were instituted in each of the states of French Indo-China under the presidency of the superior residents. The innovation was the outgrowth of a liberal policy rather than a grudging concession, and the new councils were appreciative in spirit. The council of Tongking, for instance, in its first sitting passed a resolution expressing its loyalty to France and its gratitude to M. Sarraut.

FRENCH LITERATURE. Whether it be the pressure of national events or the natural development of recent tendencies, as characterized in the 1911 and 1912 YEAR BOOKS, the fact remains that traditional and Catholic France now has the upper hand of its socialistic, cosmopolitan, and agnostic opponents. As an indication of the dominant temper, we call attention to an article in the *Revue de Paris* (February, 1913) entitled "La Prochaine génération littéraire," which declares the time ripe for a

new era of spirituality such as preceded the Romanticism of a century ago, with its militant hostility to the impious eighteenth century, and ready, too, for new Lamartine *Méditations* or a new lyricism like that of Hugo's *Odes et Ballades*. And we may cite also *Les jeunes gens d'aujourd'hui* of Agathon (pseudonym for Massis and Tarde), with chapters entitled "Le gout de l'action," "La foi patriotique," and "Une renaissance catholique": Riou's *Aux écoutes de la France qui vient*, with its call for a religious revival, protestant to be sure, but still religious; Hanotian's *La France vivante*; and Muller and Picard's *Les tendances présentes de la littérature Française*. The three books which struck the representative note, to judge by the interest they aroused, were *L'Annonce faite à Marie*, a miracle play by P. Claudel; the novel, *La colline inspirée*, by M. Barrès; and, in the field of criticism, Bertrand's *Saint-Augustin*. The serious literary temper of the times is also evidenced by the success of Maeterlinck's *La Mort*.

THE DRAMA. Among historical dramas we may name Mortier's *Sylla*, Poizat's *Sophonisbe*, and the patriotic plays, the sensational *Alsace* of Leroux et Camille, the deeper *Servir* of Lavedan, and Kistemaeker's *L'Occident*, with its broader scope. Notable, also, are the light plays, by way of protest against the gloomy realism of yesterday, witness the *Institut de Beauté*, by a great favorite of the public, Capus, who also offered a play *Hélène Harduin*, with a melancholy ending not at all in his customary manner; and *L'Ingénu*, by Mère and Gignoux, based upon a story of Voltaire's, and protesting against our present-day sophisticated notions of life.

Worthy of mention on different grounds are: Gold's moving dramatization of *Manon Lescaut*; Bergerat's sentimental and bright *Nuit Florentine* (which makes acknowledgement to Boccaccio's *Mandragore*); Richepin's oriental *Le Minaret*; d'Annunzio's *Pisanelle*, written to afford Mlle. Rubinstein a chance to dance, and a decided failure; and *Kismet*, which no less a literary personage than Jules Lemaitre honored by translating. Realistic plays, though persistently offered, are out of favor. Even Guitry could not save Nicomède's *Requins*, for instance; but Bènière's *Paraphe 1^{er}* must be set down as highly amusing. Feministic problems find their way into many dramas of the day. Bernstein's *Le Secret* presents a type of the wicked woman shaped by modern tendencies; Suarès's famous *Cressida*, one of the most successful works of the year, not written for the stage but yet in dialogue form, is a succession of variations on the theme of the coquette; Fleg's *Trouble-fête* tells of an interesting heroine at first sorry to have a child, then sorry to have a husband, and finally thankful for both; Kistemaeker's *L'Emboscade* has a Lucretia Borgia (as seen by Hugo) as central attraction; Bataille's *Le Phalène* centres about a protagonist drawn, it is said, from Marie Bashkirtsef; and Grillet offers an interesting attempt at a reconstruction of the romantic period around the figure of Rachel. Other plays deal sympathetically with the peculiar difficulties women have to face under present social conditions. Brioux in *Seule* shows how hard it is for women to live alone, and E. Sée's *L'irrégulière* how an incapable man drags a woman down. A metaphysical and almost religious note is introduced in Dujardin's

Marthe et Marie; and in Maeterlinck's *Marie-Madeleine*, which recalls his *Sister Beatrice*; and a decidedly religious note is struck in Francis Jammes's *Le brebis égaré* with its emphasis upon the thought of worldly love as a constant peril in a woman's life. Distinctly a religious piece is Claudel's orthodox and Catholic miracle play, already mentioned, and entitled *Annonce faite à Marie*, which has attracted European attention. The religious bent of the year's drama also produced the first stage representation of Chateaubriand's *Moïse*.

Here must be recorded the establishment in the Latin Quarter of Le Vieux Colombier, a small theatre, designed to be independent of financial considerations, and which has already brought out plays by Aeschylus, Shakespeare, Racine, Molière, Musset, and Claudel, and a thoroughly modern play, Schlumberger's *Les Fils Louverné*. Last year saw the retirement of Jules Claretie as the director of the Comédie Française, and the appointment as his successor of Armand Carré, formerly of the Opéra Comique. Under the title of *Mademoiselle Gogo*, Paul Ginisty published a remarkable life of Mademoiselle Beauménard (1730-1799) of the Comédie Française.

POETRY. Poetry is not very abundant this year, but the quality is good. The "Prince des poètes" Paul Fort, gives a new series of his *Ballades françaises, Chansons pour me consoler d'être heureux*. Saint Georges de Bouhélier, in his *Romance de l'homme* sings of his humanitarian and socialistic ideas in his usual poetic vein. Philéas Lebesgue, the peasant poet who plows year after year on his farm of the pays de Bray, celebrates in his *Servitudes* both the joys and the hardships of the man who lives in constant contact with the soil. The Comtesse de Noailles sings of death, after having sung life and the life sensual so superbly, in her *Les vivants et les morts*. Louis le Cardonnell offers new *Poèmes* in the fine mystic spirit that we know. E. Rochard's *Jésus selon les Evangiles* (with preface by Lemaitre) was crowned by the Academy. Of more classical inspiration are Mazade's *Dionysos et les Nymphes*; and entirely hellenic the *Tablettes de cire* by the Comtesse de Brimont. Much has been made of the *Sourire d'Omphale*, by Edmond Porcher, who obtained the chief prize in French poetry awarded by the Academy; it had the honor of being read before the Academy in public session by Richepin. A series of other collections deserve mention, such as: Michaut, *Les fleurs de l'arbre de la science*; Caillard, *Rosiers sur la tombe* (songs of nature); Gojon, *La grenade*; Audigier, *La ville au bois dormant* (city of Senlis); A. Jean, *Pluie au printemps*; and N. Nouet, *Cœur avide d'infini*.

THE NOVEL. Of novels of really high quality there were, naturally, few this year, but the number of good works is unusually large. The present preoccupation with religion finds expression in the fine and artistically finished *La colline inspirée* of Barrès, with its picture of the mystic religious revivals of a generation since in Lorraine. The most striking of the patriotic novels is *L'appel au soldat*, by Ernest Psychari, Renan's grandson. It tells of a soldier whose inbred agnosticism and cosmopolitan humanitarianism melt away in the heat of a glowing Catholic tradition and of a fiery patriotism that

make the hero yearn to die obscurely for the flag in any remote corner of Africa.

Patriotism also breathes through Régismanset's *Lauriers sahis*, whose message is that, if war should come, no such event as the Commune should be permitted to render useless the devotion of French citizens; and it stirs also in the pages of M. Lair's *La reprise* where, in the case of a Frenchman married to a German woman, the patriotic motive in a patriotic crisis proves stronger than any other. Daudet's protest in *La fausse étoile* against political partizanship as a menace to the future also springs from patriotic soil. Colonial stories continue to be received with much enthusiasm, witness Baratier's *Épopées françaises*, Nolly's *Gens de guerre au Maroc*, and *Le chemin de la victoire*, and Daguerches's *Kilomètre 83*, concerned with a railroad undertaking in Siam.

In glancing at the books, often by familiar names, that continue almost directly yesterday's literature, attention is especially invited to Mirbeau's *Dingo*, the sarcastic memories of his dog; to P. Adam's *Stéphanie*, which has something to say for a rather bourgeois and common-sense view of love in marriage; to Estaumier's *Les choses voient*, in which old pieces of furniture tell stories of low bourgeois passion which are comparable in gloom to Balzac at his gloomiest; to the elder Rosny's Zolaistic *Dans les rues*, which tells of the life of an *apache*, and is a sequel to *Les rafales* (see YEAR BOOK, 1912); to the younger Rosny's realistic *Sépulchres blanchis*; and to Paul Marguerite's *La maison brûlée*, which shows once more how intolerable a wicked woman can make a man's life. One of the most remarkable of the realistic novels of the year was certainly E. Perrochon's *Creux des maisons*, with its pictures of peasants plucking something of happiness from the hardest conditions. Camille Marbo won the 5000-franc prize ("Prix de la Vie Heureuse") with the *Statue voilée*, a study of women who offer the hero different types of love, which might be thought of in connection with Flaubert's *Education sentimentale*; and Marc Elder, with his study of Brittany fishermen entitled *Peuple de la mer*, won the "Prix Goncourt." A highly favorable reception from the press was accorded Charles Géniaux's *L'Océan*, concerned with life on the northern coast of France, and setting a deep tragedy of love against the background of the sea. An author from the south of France, L. Rolmer in his *Les amours ennemis*, tells a story of frenetic passion and advocates an abandonment to the joys of life; and the same spirit is in E. Montfort's *Les noces folles*. V. Marguerite in *Rose des ruines* tells a delicate story of a man whom experience has taught to be happier in his second love than in his first; and Marcelle Tinayre has written, in *Madeleine au Miroir*, an interesting novel concerning the critical age in women. In Ferval's *Double amour*, we meet again in fictitious guise Mademoiselle de la Vallière and the story of her love for Louis XIV. Of marked originality is the much-discussed psychological interpretation in fiction of the mind of Henry IV's assassin—*Ravaillac*, by the brothers Tharaud, authors of *Dingley*. In *Celles qui travaillent*, Simone Rodève gives graphic scenes from the lives of women who struggle for a livelihood. Marguerite Audoux's *Suicide* has in large part appeared in *Cahiers d'aujourd'hui*.

Two noteworthy volumes of short stories are Miomandre's *D'amour et d'eau fraîche* and Reginer's *Plateau de laque*. The first novel of the poet, A. Bonnard, under the title of *Vie et amour*, consists of variations upon the theme of love. In *L'aventure de Dame Yolande*, Avinen has tried his hand at a story in the style of middle-age romance. The contrast between the wonderful love in a land of dream of a boy's imagination and reality is the theme of Alain Fournier's *Le Grand Meaulnes*, and Aubry's *L'homme sur la cime* brings into relief a like contrast between a man's lofty aspirations and the reality of his life. Truth and point are not wanting in L. Vaillat's *Moderate et Beauchassis*, where we read of an artist who shakes the dust of artificial Paris from his feet and repairs to Normandy in quest of genuine life, only to find his new surroundings quite as artificial, and more offensively so, than those he had left. A novel—which was promptly dramatized—is Marcel Prévost's *Les anges gardiens*: it is a sensational attack on the custom of employing foreign governesses for the children of the wealthy, these ladies being in the author's view often of an exceedingly undesirable character. Of somewhat like purport is Léon Cathlin's *Leur petit garçon*, with its picture of the bad effects upon a boy of the careless choice of a preceptor. The long experience of Jehan d'Ivray in the Orient finds an interesting and informing expression in her *Souvenirs d'une odalisque*.

BIOGRAPHICAL, CRITICAL, ETC. While original literature seems to hark back to the past for inspiration, there is a decided emphasis now in scholarly fields upon more modern subjects. Among other notable works proper to the above caption may be mentioned: Kunel, *Raudelaire en Belgique*; Bryand, *Huyssman et le Satanisme*; Faguet, *Jeunesse de Sainte-Beuve*; Des Cognets, *La vie intérieure de Lamartine*; Faguet, *Rousseau artiste*; Brunetière, "Époque classique" of the *Histoire de la Littérature Française* and *Bossuet*—both from notes left by the great critic at the time of his death; Jusserand's *Bonsard*; and—a book of special interest to America—Chinard's *Amérique et rêves exotiques au 17^e et 18^e Siècle*.

The Academy awarded the "Prix de la critique littéraire" to Magne's *Voiture* (see YEAR BOOK, 1912), and the "Grand prix littéraire" went to Romain Rolland on the score of his *Jean-Christophe*.

Among the dead of the year are: C. Lemonnier, Henri Rochefort, J. Campion (the famous publisher), Lucie-Félix-Faure Goyau, E. Ollivier, P. de Coulevain, Jules Claretie, and Thureau Dangin, the Secrétaire perpétuel de l'Académie, who was replaced in this position by E. Lamy.

Monuments have been erected to Theuriet, Lamartine, Pouvillon, Corbière, Hugo (on the island of Guernsey), and Mendès. Centenaries have been celebrated, notably those of Veuillot, Amyot, and Diderot.

FRENCH SOMALI COAST. A French protectorate on the Gulf of Aden, between Eritrea and British Somaliland. The area is officially estimated at 120,000 sq. kilometers (46,332 sq. miles), and the population (1906) at 208,061 (2.0 to the sq. km.). The capital is Jibuti, with about 11,000 inhabitants. The imports in 1911 were valued at 32,620,638 francs, and the exports at 45,387,427 (coffee,

ivory, hides, skins, etc.). Vessels entered (1910), 198, of 545,929 tons. The local budget for 1909 balanced at 1,373,000 francs. The railway from Jibuti into Abyssinia (total length 193 miles) has 81 miles in French Somali Coast. The governor in 1913 was A. J. Bonhoure.

FRENCH WEST AFRICA. A French government-general with headquarters at Dakar (since 1902), created by the decree of June 16, 1895; M. Chaumemps being the colonial minister. By the decree of October 18, 1904, French West Africa was defined as including five colonies, the Niger territory being comprehended in the colony of Upper Senegal and Niger, and the civil territory of Mauritania. By the decree of September 7, 1911, to take effect January 1, 1912, the Niger territory was separated from Upper Senegal and Niger colony and became an administrative subdivision known as the Military Territory of the Niger, under a commandant. The area and population (March 5, 1911) in the table below are according to the 1912 issue of the *Annuaire statistique*:

	Sq. kms.	Pop.	D.*
Senegal	191,640	1,250,590	7.0
French Guinea.....	238,988	1,737,346	7.0
Ivory Coast.....	325,228	1,216,284	4.0
Dahomey	97,200	878,504	6.0
Upper Sen. & Niger }	2,166,478	6,036,198	3.0
Mil. Ter. of the Niger }			
Mauritania	893,696	225,154	0.2
Total.....	3,913,250†	11,344,076	3.6

* Density. † 1,510,900 square miles.

Other French authority gives 107,000 sq. kilometers for Dahomey; 1,300,000 for the Military Territory of the Niger; and 2,000,000 for Upper Senegal and Niger inclusive of the French zone of influence in the Sahara, or 819,000 for the administrative districts. Dakar, in Senegal, is the capital, with 24,914 inhabitants (2383 French).

The total imports in 1911 were valued at 150,817,649 francs (153,095,448 in 1910); of which goods to the amount of 67,573,618 francs came from France, 2,173,595 fr. from French colonies, 80,970,436 fr. from other countries. Exports, 117,125,103 francs: 58,552,060 fr. to France, 76,213 fr. to French colonies, 58,496,830 to other countries.

For shipping, railways, commercial and other details, see articles on the separate colonies and territories.

WIRELESS TELEGRAPHY. There is perhaps no place on the globe to which wireless telegraphy comes as a greater boon than to these African wilds, where distance and danger doubly isolate important posts in the hinterland and render the burden of wire maintenance difficult, perilous, and economically wasteful. Yet the first experiment in wireless telegraphy in Senegal proved unsuccessful and was abandoned, and it was not until January, 1906, that small stations were again opened at Dakar and Rufisque. A third post was established at Port-Etienne (Mauritania) in May, 1909, and a high-power station replaced the small one at Rufisque in October of the same year. The two stations cost 410,500 francs for installation and 90,000 annually for maintenance; the construction of a submarine cable between the two points would have cost for installation 4,425,-

000 francs and for annual maintenance 150,900 francs.

In 1909, in pursuance of a plan to extend the service the length of the (French) coast, permission was obtained from the Liberian government to establish a post at Monrovia. By September, 1912, the following stations were in operation: Port-Etienne-Rufisque, 770 kilometers; Rufisque-Conakry, 700; Conakry-Monrovia, 450; Monrovia-Tabou (Ivory Coast), 450. Under construction are posts at Grand-Bassam, 400 km. from Tabou, and Cotonou (Dahomey), 700 km. from Grand Bassam. Cotonou will complete the circle. A special coast station at Dakar was opened September 1, 1911, mainly for defense and maritime purposes. The establishment at Timbuktu of a great central radiograph station will solve the problem of trans-Saharan telegraphic communication, hitherto regarded as an unrealizable dream, because of the impossibility of laying or maintaining wires through forest and across desert infested by wild beasts and marauding nomads and torn by tropical storms.

The governor-general in 1913 was A. W. Merlawd-Ponty (October 18, 1904). The budget balanced (1911) at 56,250,000 francs. The debt stood January 1, 1912, at 156,277,336 francs.

FRIEDMANN'S ALLEGED TUBERCULOSIS CURE. See TUBERCULOSIS.

FRIENDS, RELIGIOUS SOCIETY OF. There are four bodies of the Friends—the Orthodox, the so-called Hicksite, the Wilburite, and the Primitive. The first named branch is the largest. There were in 1913, 100,568 communicants, 90 churches, and 1325 leaders or ministers in this branch. In the Hicksite branch were 19,597 communicants, 211 churches, 99 ministers. In the Wilburite, 3880 communicants, 48 churches, and 47 ministers. In the Primitive, 171 communicants, 8 churches, 10 ministers. The Hicksite branch is known also as the Liberals. This society was unusually active during the year. A summer school lasting two weeks was held in Philadelphia. The biennial general conference will be held from September 2 to 8, 1914, at Saratoga Springs.

FRUIT RAISING. See HORTICULTURE.

FUEL. See CHEMISTRY, INDUSTRIAL.

GAILLARD, DAVID DU BOIS. An engineer of the United States army, died December 5, 1913. He was born at Fulton Post Office, Sumter, S. C., in 1859, and graduated from the United States Military Academy in 1884. In the same year he was appointed second lieutenant in the corps of engineers. In 1887 he studied at the Engineers' School of Application and in the same year was made first lieutenant. From 1887 to 1891 he acted as assistant to Captain William M. Black, chief engineer in charge of various surveys and harbor improvements in Florida. He was a member of the commission which surveyed the international boundary between the United States and Mexico (1891-94), and from 1895-98 was in charge of the Washington aqueduct. During the Spanish-American War he served in the United States and Cuba. He was chief engineer of the department of Santa Clara, Cuba, for several months in 1899, and from the latter part of that year to 1901 was assistant to the engineering commission of the District of Columbia. For two years following he was in charge of all

river and harbor improvements on Lake Superior. In 1903-04 he was a member of the general staff corps, and engineer officer of the northern division, and from 1904 to 1906 was on duty at the Army War College. After serving in the Philippines from August, 1906, to February, 1907, he was appointed in the latter year a member of the Isthmian canal commission and a director of the Panama Railroad. His first work at the Panama Canal was a supervision of the dredging of harbors, building of breakwaters, etc. On July 1, 1908, he became division engineer of the central division of the Panama Canal, comprising that portion extending from Gatun to Pedro Miguel. This division includes the famous Culebra Cut. In 1909 he was promoted to be lieutenant-colonel. Lieutenant-Colonel Gaillard was one of the chief aids of Colonel Goethals in the building of the excavation of the Culebra Cut, of which he had charge. This was one of the most stupendous engineering undertakings ever accomplished, and that it was done so quickly, notwithstanding the frequent landslides which prevented progress, was due largely to the efficiency and skill of Colonel Gaillard. He was able to remain at his task until the cut had been practically completed, but he had long suffered from overwork and climatic conditions at Panama. His death resulted from excessive application to his work.

GAMBIA. A British west African crown colony (69 sq. miles, 8807 inhabitants) and protectorate (4000 square miles, 152,000 inhabitants) on the river Gambia. Capital, Bathurst, on St. Mary's Island. The rainfall in 1910 was 28 inches, and the highest shade temperature was 112° at MacCarthy's Island in April and May. Products and exports are peanuts (£437,472 in 1911), palm kernels (£4748), wax (£1614), rubber (£836), and ivory (£215). Export of specie (1911), £215,573; total exports, £682,036. Imports of specie, £384,784; cotton goods, £130,324; kola nuts, £72,598; rice, £62,459; sugar, £12,611; spirits, £8513; etc.; total imports, £807,118. Revenue, £86,454; expenditure, £71,390. Tonnage entered and cleared, 480,911. Governor, 1913, Lieut.-Col. Sir H. L. Galway (Hon. Cecil Gwyn, acting).

GARBAGE AND REFUSE DISPOSAL. A garbage and refuse incinerator for San Francisco was completed during the year. The designs for the plant were made after a careful investigation of the amount of garbage, rubbish, and ashes collected in various parts of the city. The city was then divided into four districts, for each of which an incinerator was proposed in order to save length of haul of the material to be burned. One district is so sparsely settled that it will not need an incinerator for years to come. Two of the others were combined for the present and bids were asked for a 120-ton plant for each, one of the plants (North Beach) to be so arranged as to be capable of future enlargement to a capacity of 360 tons a day. The plant completed in 1913 is known as the Islais Creek Incinerator. Mixed refuse is brought to it in wagons, weighed, and then dumped into a concrete garbage pit holding 120 tons, or a full day's capacity of the furnaces. From this pit the refuse is lifted by an electrically operated grab bucket and traveling crane and moved to a position over steel containers, into which the grab bucket is

emptied. From the containers the refuse is dumped, through sliding-bottom doors operated by rams, onto the drying hearths of the furnaces. After having been dried the refuse is raked forward onto the grates by stackers and there burned.

Each of the two 60-ton furnaces has four grates. The grates are separated by brick walls, pierced by arches, through which latter the gases of combustion pour to a combustion chamber where they are subjected to high temperature. From each of the two combustion chambers the hot gases pass to boilers, thence to tubular air heaters for the sake of utilizing still more of the heat of the gases. Finally the gases, now relatively cool, go to a dust-settling chamber and to and up a reinforced-concrete chimney, 9 feet in internal diameter and 150 feet high. The clinker, remaining after the refuse is burned, is dropped into a chamber beneath the grates, then pushed by a ram through doors into a car and conveyed to a crusher. The crushed clinker is moved by a conveyor and a continuous bucket elevator to a revolving screen, which grades it into $\frac{1}{2}$, $1\frac{1}{2}$, and 3-inch sizes, after which it is dropped into storage bins. From these it is drawn for use in making concrete. To maintain a high temperature in the furnaces forced draft is used. This is supplied by a pressure blower which takes air from those parts of the building where the air may be foul. The air is forced through the air heater already mentioned, and then goes by means of ducts to the base of the clinker chamber beneath the furnace grates and up through the hot clinker, which it helps cool, and on up through the grates, and the refuse upon them. The boilers already mentioned were expected to produce about 300 horse power, together. Some of their power is used for steam-driven and some for electric-driven machinery, and some for heating and lighting the plant. Later on it was expected that surplus power would be used in conjunction with a municipal power plant. The steel framework of the building which houses the furnaces was designed to resist possible earthquake stresses, as was also the reinforced-concrete chimney. The concrete walls of the building and the concrete chimney were finished with a cement gum, by means of which cement or cement mortar is applied by air pressure. The buildings are in the old Spanish Mission style of architecture, with red-tile roofs. Cleanliness was had in mind in designing the interior of the buildings.

Although San Francisco and some other cities were building modern British types of garbage and refuse incinerators, the garbage of most of the larger cities of the United States continued to be disposed of by the reduction process. Except in the cases of Cleveland and Columbus, Ohio, the reduction plants were owned and operated by private companies, and until quite recently the cities paid the contractors for treating the garbage, although the latter got more or less return from the grease and fertilizer base which the reduction process yielded. In August, 1913, New York City awarded a garbage reduction contract under which the contractor agreed to pay the city for garbage delivered at the water front of Manhattan, Bronx, and Brooklyn boroughs, \$62,500 for the first year, \$87,500 for the second year, and \$112,500 for the third year. The

city had the option of continuing the contract for two additional years at the rate for the third year. The contractor agreed to build a plant with a capacity sufficient to treat 2000 short tons of garbage a day. The estimated amount of garbage delivered to the former contractor in 1912 was 345,000 tons for the entire year. The former contractor was paid \$50,000 a year for garbage disposal and bid \$130,000 a year for the new five-year contract. The price under both contracts included the cost of transportation by water to the reduction plant on an island in Jamaica Bay, not far from Coney Island and Far Rockaway.

During the year Los Angeles let a ten-year garbage-reduction contract, under which it was to be paid 51 cents per ton for all garbage which it delivered to the contractor at a single point within the city. Free disposal of garbage by the reduction process was secured by the city of Springfield, Mass., in 1913. The city collects the garbage and delivers it to the reduction plant without cost to the contractor. The plant is built on land owned by the city and leased to the company. At the end of ten years the city may either take over the plant for \$50,000 or continue the contract for ten years more, and then take the plant without any payment. The plant treated about forty tons a day in the summer of 1913, and at the close of the year it was being enlarged. The contracts, combined with the reported profits from the municipal plants at Cleveland and Columbus gave rise to hopes that cities may hereafter be relieved of the cost of garbage disposal, even if its collection does involve considerable expense. It should be noted, however, that neither of the plants called for by the New York and the Los Angeles contracts was in operation at the close of the year, so the success of these particular contracts has yet to be demonstrated. Moreover, there were difficulties over garbage-reduction contracts at Philadelphia, Chicago, and St. Louis during the year, which gave reason to believe that the time had arrived for serious question as to the need of reform in garbage-reduction contracts. In the past most of these contracts had been drawn without competent engineering advice—on behalf of the city, at least. Besides this serious danger another one lies in the shortness of most of the garbage-reduction contracts. The Philadelphia contracts were for one year, and rarely are any garbage-reduction contracts for more than five years. Such short-term contracts mean that the contractor must either recover his capital investment in a brief period or else run great risk of loss—unless he feels certain that his political friends have the willingness and power to see that his contract is renewed on favorable terms when it expires. At Chicago, the city temporized over letting a new contract for garbage disposal until finally the old contract expired and the contractor shut down the garbage-reduction plant on October 1, 1913. Steps to buy the plant were taken by the city, but the purchase had not been completed at the end of the year and the city was getting rid of its garbage by make-shift methods. At Philadelphia, it should be stated, the city seized and itself operated the contractor's reduction works.

In Europe the almost universal practice still was to mix garbage with ashes and rubbish and burn the whole in refuse destructors—that

is, where any improved means of disposal had been adopted. It was reported during the year that the health department of the State of Victoria, Australia, had served notice on thirty-two municipalities to abandon refuse "tips" or "dumps" and install destructors. So far as known, this was the first order of the kind issued in any part of the world.

GARDINER, JOHN HAYS. An American educator and writer, died May 15, 1913. He was born in Gardiner, Me., in 1863, and graduated from Harvard University in 1885. He studied law at the Harvard Law School in 1886-87. In 1892 he was appointed instructor in English in Harvard University, filling this chair until 1900, when he became assistant professor. He was the author of *Forms of Prose Literature* (1900); *Elements of English Composition* (1902); *The Bible as English Literature* (1907); *Manual of Composition and Rhetoric* (1907).

GAS, NATURAL. The year 1912 was one of greatest prosperity in the production of natural gas, and was remarkable for the making of high industrial records. Important features were increased production, the extension of pipe lines to new communities, consequent increased consumption of gas for both domestic and industrial purposes, and increased prices. One feature of particular interest was the completion of the pipe line which conveys natural gas from the Buena Vista Hills of Kern County, Cal., to consumers in the city of Los Angeles and the surrounding towns. This line was built under great difficulties and at great cost.

The total production of natural gas produced in the United States in 1912 was 562,203,452 cubic feet, valued at \$84,563,957. This compares with 512,993,021 M. cubic feet, valued at \$74,621,534 in 1911. The largest quantity was produced in West Virginia, 215,785,027 M. cubic feet, valued at \$29,064,968. Pennsylvania produced 112,149,885 M. cubic feet, valued at \$18,539,672. Oklahoma was third as a producer with 73,799,319 M. cubic feet, valued at \$7,406,528. Other States producing large quantities were Ohio, Kansas, New York, California, Texas, Illinois, and Indiana. Of the total production in 1912, 337,550,875 M. cubic feet were used for industrial purposes, and 193,454,802 M. cubic feet for domestic purposes.

Natural gas is produced in many foreign countries, the most important of which is Canada. The production in that country in 1912 was valued at \$2,263,700. There is also a considerable production in Galicia, Hungary, and Italy. The amount of gasoline produced from natural gas in the United States in 1912 was 12,081,179 gallons, valued at \$1,157,476. To make this, 4,687,796,329 cubic feet of gas were used.

GASES, DISCHARGE THROUGH. See PHYSICS.

GAUL, ALFRED. An English composer, died September 13, 1913. He was born in Norwich, England, in 1837, and studied music at Cambridge University. He acted as organist in several cities, and in 1887 became conductor of the Walsall Philharmonic. Up to a short time before his death he was teacher in and conductor of the Birmingham and Midland Institute, and a teacher in several other institutes. He was the author of the oratorio *Hezekiah*, and the cantatas *Ruth* and *The Holy City*. The

last named is by far the best known of his works. He wrote also a number of trios, duets, and psalms.

GAYNOR, WILLIAM J. An American jurist and public official, died at sea, September 11, 1913. He was born in Whitestown, Oneida County, N. Y., in 1851. His father was an Irish farmer who was prominent in the early abolitionist movement, and was a follower of Beriah Green and Gerritt Smith. The son was baptized in the Roman Catholic Church. He received his education in the Assumption Academy and in the Whitestown Academy. For a time he studied theology, and went to the Christian Brothers College in St. Louis. After three years there, he visited California, Mexico, and the Isthmus of Panama, returning thence to the East, and for a time teaching school in Boston. He then decided to study law, and in 1873 removed to Brooklyn, where he worked as a newspaper reporter to support himself while he studied law. He was admitted to the bar in 1875, and went to live in Flatbush, a section of Brooklyn which at that time was entirely in the hands of corrupt politicians. The young lawyer began at once to oppose these conditions, and he wrote and spoke so effectively that threats were made that he would be assassinated. In spite of this he persisted, and as a result of his efforts, drove the unlicensed saloon-keepers out of the village, and put up and elected a reform citizens' ticket. He was made a police commissioner of Flatbush. This was the first work of a long series of his crusades against lawless persons. In 1885 he removed to Brooklyn proper. Here he found conditions much the same, but on a larger scale than he had found them in Flatbush. The city was governed by a political ring headed by Hugh McLaughlin. Mr. Gaynor, acting as a citizen, opposed the scheme of McLaughlin's, whereby the latter proposed to sell the city for \$1,500,000. property which had been purchased for \$185,000. A suit was begun and carried through every court to the highest. This resulted in the defeat of the ring, and exposure of conditions under McLaughlin. His next crusade was against the elevated railroad of Brooklyn, which had up to that time succeeded in avoiding the payment of taxes. Through his efforts, these roads were obliged to pay more than \$1,000,000 in back taxes. He had by this time become one of the most conspicuous figures in New York State, and in 1893 was elected judge of the Supreme Court. During this campaign he became a national figure. As a result of his successful efforts against John Y. McKane, a notorious politician who was at that time the virtual master of Coney Island (McKane's methods included the padding of the voting lists and the stealing of ballots), Mr. Gaynor warned him that if he endeavored to debauch the ballot in the election of 1893 he would be sent to prison. McKane defied these threats and defied the law. On election day, Mr. Gaynor had the polls watched and the watcher armed with injunctions from the Supreme Court. McKane and his men assaulted these watchers and drove them away. Gaynor thereupon secured the appointment of special deputy attorney-generals by the governor, and with these undertook the work of prosecuting McKane. As a result McKane was sentenced to seven years in the penitentiary, and sixteen of his followers went to prison. Mr. Gaynor was now one of the most

important Democratic politicians in the State, and was asked by David B. Hill in 1894 to run for governor. This he declined to do. Two years later he declined to be a candidate for mayor of Brooklyn. At the Democratic city convention of 1903 he was a candidate against George B. McClellan, and received 219 votes. There was a popular demand for him as a candidate for governor in 1904, but Tammany opposed him, and he failed of the nomination. He was nominated as a candidate for the Democratic party for mayor of New York in 1909. In this election he had the support of Tammany Hall. He had two opponents, Otto T. Bannard, Republican, and William R. Hearst, Independent. Gaynor's victory was sweeping. He received 250,378 votes, as compared with 177,304 votes for Mr. Bannard, and 154,187 for Mr. Hearst. The rest of the Democratic ticket, however, was badly defeated. As a result he became mayor, with the other officials of the city government either Republicans or Independents in politics. Once elected, the mayor lost no time in convincing Tammany Hall it would have no consideration at his hands. He selected for his advisers and department heads, able business men. He began to put into practice reforms which he had developed from years of experience, and he did away with many useless and expensive commissions which had existed under former governments. His simplicity, his genuine interest in life, and his shrewdness and ready wit, combined with his fearlessness, all endeared him to the people. On August 9, 1910, as he embarked on a steamship for a voyage to Europe, he was shot by James J. Gallagher, the bullet penetrating his neck, but the mayor, after weeks of suffering, recovered in a measure, and resumed his duties. He never recovered from the shock of the experience, however, and until the time of his death the effects of his wound became more and more apparent. In 1912 he allowed his name to be used as a candidate for the Democratic nomination for the presidency. He was bitterly opposed by Tammany Hall, however, and his name was not mentioned in the convention. In the campaign for mayor in 1913, he was refused a renomination by Tammany Hall, the Democratic organization in the city, but his supporters nominated him in a public meeting held in City Hall Park. Several days after he accepted this nomination, he sailed for Europe and died suddenly before the steamship had reached Queenstown. Mr. Gaynor, during his service as mayor, became known not only for his political and civic activities, but for his unique and remarkable letters which were published in all the newspapers, and were read throughout the country. These letters were written with a simplicity and humor that made them delightful reading. A volume of these letters was published shortly before his death. Mr. Gaynor left the Roman Catholic Church, and became a communicant of the Protestant Episcopal Church early in life.

GEMS AND PRECIOUS STONES. The principal gem mineral mined in the United States during 1912 was Montana sapphire, of which there was a large output for use both as gems and in mechanical applications. The development of the opal deposits at Humboldt County, Nevada, met with large success, and a quantity of magnificent gem material was obtained. The opal is of an unusual type, consisting of dark, translucent mineral with a va-

riety of rich colors. The deposits promised to supply a gem equal if not superior in beauty to the opal from Australia. The total value of the gems of all sorts mined in 1912 was \$319,722, a decrease of \$23,980 in value from 1911. There were large changes in the production of some minerals. The output of opal increased from \$1875 in 1911 to \$10,925 in 1912; kunzite from \$75 in 1911 to \$18,000 in 1912; turquoise decreased from \$44,751 in 1911 to \$10,140 in 1912. In addition to the gems and precious stones already mentioned, the most important of those produced were tourmaline, valued at \$28,200; agates, \$9978; turquoise, \$10,140; variscite, \$8450; and peridot, \$8100.

DIAMONDS. Diamonds are found in the United States in Arkansas, Indiana, Texas, and California. The total value of the output in Arkansas in 1906, the year in which the first discoveries were made, is estimated at \$12,108. About twenty diamonds have been found in Indiana during the last thirty-five years in Morgan and Brown counties. These have been discovered in panning and washing for gold. A diamond was found in June, 1911, in Foard County, Texas. This was a rough diamond, rather brown, but fairly clear, and would yield a good gem weighing about one-quarter of a carat. Several diamonds were found in 1912 in Butte County, Cal., while washing gold in the placers of Cherokee Flats.

The production of diamonds during the fiscal year 1912 by the De Beers Consolidated Mines in South Africa amounted to 2,087,392 carats, as compared with 2,180,856 carats in 1911. Actual sales during the year amounted to \$26,884,858. The feature of the South African diamond mining during 1912 was the absorption of the Voorspoed diamond mine in Orange River Colony by the De Beers Consolidated Mines. The production of diamonds in German Southwest Africa for the year ending March 31, 1912, amounted to 726,465 carats, which were sold for \$4,712,831. The production from April 1 to September 30, 1912, amounted to 439,261 carats which sold for \$2,938,539. See also under **DIAMONDS**.

IMPORTS. The total value of the imports of diamonds and other precious stones in 1912 was \$40,363,325. Of these, unset diamonds were valued at \$22,865,685, and pearls at \$5,130,376.

BIRTH STONES. In August, 1912, the American International Retail Jewelers' Association adopted a standard list of birth stones. The chief changes are the addition of alternative stones for certain months. Following is the list adopted: January, garnet; February, amethyst; March, bloodstone or aquamarine; April, diamond; May, emerald; June, pearl or moonstone; July, ruby; August, sardonyx or peridot; September, sapphire; October, opal or tourmaline; November, topaz; December, turquoise or lapis lazuli.

GENERAL STRIKES. See **BELGIUM**; **SOCIALISM**; **STRIKES**; and section *History* under various countries.

GEOGRAPHICAL SOCIETY, AMERICAN. A body organized in 1852 for the purpose of investigating and disseminating new geographical information. It was established in New York for the benefit of commerce and navigation, and the institution opens sources of accurate information for public use in every part of the globe. In 1912 a new building for the

society was completed at Broadway and 156th Street in New York City. Its annual publication bulletin contains over 1100 pages. The society coöperated in fitting out the Crocker Land Expedition under the command of D. B. McMillan, which sailed from New York in the summer of 1913. The officers are as follows: President, A. M. Huntington; vice-presidents, Walter B. James, John Greenough, Anton A. Raven; corresponding secretaries, William Libbey, Archibald D. Russell; recording secretary, Hamilton F. Kean. The society has about 1200 members.

GEOGRAPHIC SOCIETY, NATIONAL. A society, founded in 1888, with the object of collecting and diffusing geographic knowledge, chiefly through its official organ, *The National Geographic Magazine*. It maintains research work both independently and in connection with other organizations and institutions. During 1913 an examination was made into the eruption of Mount Katmai and neighboring volcanoes in Alaska. The membership of the society is about 150,000. The officers are: President, Henry Gannett; vice-president, O. K. Tittmann; secretary, O. P. Asutin; director and editor, Gilbert H. Grosvenor. The headquarters are in Washington.

GEOLOGY. The present review continues the plan adopted in preceding years—to outline some of the leading subjects of current investigation and discussion with especial reference to those having a broad relation to the general principles of the science. Recent progress was not marked by any extraordinary events that arrested attention or diverted it into new fields; still a great mass of useful information was added to the accumulated store as a result of intensive activity in all the various branches. One line of work which was being steadily advanced and which had a very important bearing upon the whole domain of geology was that connected with the areal map. The mapping and description of geological formations are more particularly the function of governmental surveys; in this country both State and Federal organizations were engaged upon the task and they were also carrying on many investigations of economic and scientific interest which were quite beyond the resources of the individual worker.

GEOLOGICAL CONGRESS. The twelfth session of the International Congress which was held in Toronto from August 7 to 14, brought together a large number of geologists from all parts of the world. It was presided over by Dr. Frank D. Adams of McGill University. Preliminary to the meeting a committee of Canadian geologists, with the coöperation of leading authorities in different countries, had undertaken the preparation of an extensive account of the coal supplies of the world, as a companion work to that issued on iron ores, which was presented at the eleventh congress held in Stockholm in 1910. Further reference to the report will be made in another place. The attention of the members during the sessions was directed to a specified list of topics, which would be illustrated by Canadian conditions, such as the differentiation of the igneous rocks, origin and correlation of the Pre-Cambrian formations, glacial geology, and the influence of depth upon the deposition of the metallic minerals. It was decided to hold the next congress in Belgium in 1917.

AGE OF THE EARTH. The discovery of the radio-activity of the common rock materials was followed by a revision of previous estimates of the earth's age, made necessary on account of the influence of radium upon the temperature gradient. Some of these estimates have already been noted in the YEAR BOOK. There seemed to be general agreement among geologists that radio-activity was a factor that tended to lengthen the time beyond the limit fixed by physicists (for example, Lord Kelvin) on the basis of the refrigeration of a once molten globe. The latest contribution to the subject, in 1913, by Arthur Helms, brought out the apparent anomaly that if the proportion of radium in the interior was the same as that in the surface rocks the earth should be growing hotter. The temperature gradient, also, should be much higher than the average that had been found. That the heat of the earth is not increasing, but the opposite condition holds, is attributable to the fact that radium is more concentrated in the acid rocks which are characteristic of the outer crustal zone. The crustal portion has a mean density of 2.8 and an approximate thickness of 30 miles. Below occurs an ultra-basic zone having a density of 3.4 and continuing to depths of from 600 to 900 miles. The internal core is regarded as consisting largely of iron with a density of 8. On the basis of the existing proportion of helium to lead, which are the end-products of uranium; the elapsed time since the beginning of the Archæan era was found to be from 1300 to 1600 million years. This was a much more liberal interpretation of the results than had been previously given.

DESCRIPTION OF FAULTS. The lack of uniformity in the use of terms applied to the phenomena of faulting had been a source of much confusion to students, which rather increased with the development of knowledge and the introduction of many new ideas regarding the subject. The need for a revised nomenclature was emphasized in a series of articles that was published some time ago in *Economic Geology*, but the various suggestions as to the form it should take did not lead to any definite results. A committee appointed by the Geological Society of America in 1908 submitted a report in which there was incorporated a scheme that might serve as a basis for the accomplishment of the desired object. The changes recommended by the committee were too numerous to be mentioned here, although it may be said they were not so radical or so sweeping as those involved in some of the plans hitherto proposed. In fact, the committee stated that it had introduced no changes in terms which had a recognized meaning, and had endeavored to follow the best usage wherever terms were employed with different meanings. The classification advocated for adoption was based upon genetic and descriptive principles, rather than upon features of origin, which were considered as being insufficiently understood at present to afford a feasible plan.

CONTINENTAL UPLIFT AND SUBSIDENCE. The changes of relative position between the land and the sea, which have taken place on a great scale in the geological past and are no doubt even now in progress, were discussed by T. C. Chamberlin from the various view-points that have afforded a basis for previous explanations. The theory of internal stresses, such as were

usually comprehended by the name diastrophism, was held to be unsuited to explain the broad adjustments between the land and the sea which govern the transgression of the latter and the formation of sedimentary terranes. Such adjustments are nicely balanced, requiring harmonious relations between the land movements and the sea, which could scarcely result from diastrophism. Also, the view that the adjustments arise from vertical stresses, superinduced by a change of load, was rejected, because the shifting of load by erosion in one place and deposition in another tends to produce a warp of the superstructure, rather than a movement that retains the parallelism between sea-surface and sea-bottom characteristic of continental shelves. There is, however, another kind of stress that arises from the force of gravity acting upon the continental masses by reason of their elevation above the ocean beds. This gravitative stress involves a lateral component, equally whether the continents be considered as resting upon an inflexible base or whether they float, as it were, on a molten interior and are maintained in a state of isostatic adjustment. The lateral spreading force for a prism of rock of average density that corresponds to a difference of relief, as between a continental elevation of 6000 feet and a sea depression of 12,000 feet, or 18,000 feet in all, would be about 16,000 pounds per square inch; and in the case of the extremes of relief of about 30,000 feet, as exemplified by the Tibetan plateau and the adjacent Indian Ocean, the unbalanced lateral stress is around 25,000 pounds to the square inch. Such intense pressure in an isolated prism must be accompanied by lateral creep, as indicated by the phenomena of creep often noticed in the floors of deep mine-openings. The lateral stress in continental masses is supported to some extent by the buttresses of the submarine continental slopes, but how far such resistance to lateral spread may be effective is difficult to estimate. It would appear, however, that there may be an appreciable horizontal movement of the rocks, which is suggested by the lateral motions in faults and by the prevalence of tensional faulting over compression faulting. It is thought that the outward glacier-like creep of continents helps to maintain equilibrium with the building up of the continental shelf by sedimentation.

THEORY OF METAMORPHISM. The application of physico-chemical principles to the study of metamorphism was brought out in a very suggestive paper by John Johnston and Paul Niggli of the Carnegie Geo-physical Laboratory. The authors stated that the features conditioning the changes collectively described as metamorphism are the same as those determining chemical equilibrium, and hence come under the principle of the phase rule. The factors may be summed up under the heads of change of temperature, uniform pressure, stress, chemical composition, and speed of reaction. Metamorphism occurs whenever the original components become unstable by reason of changed external conditions. A knowledge of these factors may be used as a basis for the prediction of the character and significance of metamorphic processes, but there are elements of uncertainty involved owing to the lack of uniformity in temperature and pressure during the change. All kinds of metamorphism inclusive of contact,

dynamo-metamorphism, etc., involve the same factors. While the application of physico-chemical principles is held to be a difficult matter, the opinion is expressed that experimental investigations on that basis may lead to important results.

ORIGIN OF THE IGNEOUS ROCKS. The derivation of the varied classes and types of igneous rocks from a few parent bodies or magmas is an accepted principle of modern geology. But students of the subject hold variant views as to the precise methods by which the magmas have been split up, or differentiated, into the resultant products. A number of papers, representative almost of an equal number of standpoints, appeared during the year. R. H. Daly advocated the force of gravitation acting upon the crystallizing materials as the leading factor. He also maintained that many species are the result of assimilation of the country rocks by the magma in its advance toward the surface, leading to "synthetic" magmas. Harker maintained that fractional crystallization was the principal agency, and conceived that a magma in process of crystallization may be pictured as having an open fabric like a sponge with the still molten matter occupying the pores. Under crustal stresses this interstitial liquid is squeezed out, and being of different composition than the consolidated material gives rise to a separate rock type. H. S. Washington described some cycles of eruption noted in the volcanoes of Sardinia, in which the first rocks formed had an acid character, the following ones an intermediate composition, while the last products were of basic character.

The alkaline rocks, which are designated oftentimes as the "Atlantic" type, on account of their prevalence within the Atlantic continental zones, are considered by C. H. Smyth to have formed from the sub-alkaline or "Pacific" magmas by a process of differentiation influenced by mineralizing solutions and vapors. Among these are water above the critical temperature, chlorine, sulphur dioxide, and other gaseous or volatile substances that are recognized as having an important relation to the origin of pegmatites. The alkaline rocks in fact show a degree of similarity to these coarse forms of granite, particularly in their content of the rarer elements.

VOLCANOES. A party of American geologists was organized in 1911 to study volcanic problems at Kilauea, with the particular purpose of bringing modern methods and equipment to bear on the almost insuperable difficulties of such an investigation. An account of the earlier work by the party was given by Perret. Among the results accomplished were accurate temperature observations of the molten lava in the crater, which necessitated a revision of previous data that had been obtained by indirect means. The lava in the crater bowl was found to have a temperature of 1050° C., and a possible range of from 1000° to 1200°. A thermo-electric couple of platinum and iridio-platinum was used, immersed from 30 to 50 centimeters below the surface of the lava pool. Previous determinations were made by noting the fusing point of metal wires in contact with the magma, a method rendered unreliable by the chemical reaction between the metal and the sulphur present in the lava. Wires of wrought iron and nickel melted quickly when immersed, although normally requiring a heat of 1300° C. for iron

and 1450° for nickel. Samples of the molten lava were dipped from the pool and subjected to chemical analysis to discover the nature of the volcanic gases. These included chlorine, hydrochloric acid, sulphur dioxide, carbon dioxide, carbo monoxide, hydrogen, and nitrogen. Among the solids sodium and potassium chlorides and bitumen were found. The combustible nature of certain gasses may be noted as tending to confirm the reported presence of flames in volcanic emanations, although such phenomena were ascribed usually to reflection of the red hot lava upon the smoke clouds. According to Dr. Albert Brun, who analyzed the materials, whatever water vapor may have occurred was formed secondarily by chemical reaction during the escape of the gases into the atmosphere and did not issue from the depths. This conclusion is antagonistic to previous conceptions of igneous fusion and to prevalent theories of the active agency of magmatic waters in the formation of ore-bodies, and it will probably be contested. To the presence of gases Perret ascribed an important rôle in the upward migration of the lava from its source in the earth's interior. The gases naturally collect above the igneous body and there exercise a strong fluxing power upon the rock walls, tending to make a vertical channel toward the surface. Without their coöperation the igneous mass would be unable to make its way against the force of gravity and the cooling effects exercised by the contact with the walls. See also article VOLCANOES.

TEMPERATURE GRADIENT. A deep well was in progress of drilling near McDonald, in the natural gas region of western Pennsylvania. In May, 1913, a depth of 6299 feet had been reached, making it the deepest hole in this country, and, with one or two exceptions, the deepest in the world. Measurements of temperature were taken at intervals below 5000 feet depth: At 5150 feet the thermometer registered 110° F.; at 5220 feet 120°; at 5800 feet 140°; at 6000 feet 100°; at 6270 feet 156°. The fall in temperature at 6000 feet was ascribed by I. C. White, who reported the results, to cooling by expansion of a body of natural gas which was encountered at that depth. In the vertical distance of 1120 feet covered by the measurements there was an increase of one degree for each 24.4 feet of descent—a rate much higher than the average record for shallower holes. A flow of saline waters encountered at 6260 feet may be considered perhaps an instance of the so-called connate waters which were imprisoned in the rocks at the time of their deposition beneath the sea.

PRE-CAMBRIAN FORMATIONS. The classification of the Pre-Cambrian rocks was discussed by members of the international congress at Toronto. The principal feature, it would appear, was the lack of any uniform basis for comparing the rocks of different countries and even lack of agreement among geologists of the same country as to the proper standards for subdivision and correlation. One result of the discussion was the adoption of a resolution by the congress to the effect that countries having contiguous areas of these rocks should form international committees for the purpose of settling upon some standard of correlation.

CORAL REEFS. Darwin's theory of the growth of coral reefs may be said to have lost much of its former prestige through the conflicting testimony brought forward in the last quarter of a century by Murray, Alexander Agassiz, and others. According to Davis the real test of the theory of subsidence, as propounded by Darwin, was given by J. D. Dana whose investigations in the course of the Wilkes expedition seem to have been generally overlooked. Dana's contribution consisted in placing a proper value upon the physiographic features of the central volcanic islands, which he showed were characterized by abrupt shorelines, cliffs, and deep embayments. These features denote the subsidence of a once elevated and deeply-eroded land surface. Where present they afford the strongest possible support to the explanation of barrier reefs, and probably also of atolls, by the upward growth of corals on a subsiding platform. The conclusion reached by Davis is that "the theory of subsidence deserves for a number of well-studied examples the acceptance that it once enjoyed and that it for a time lost."

GLACIAL GEOLOGY. A summary of the results of many years of study of the glacial phenomena of New York State was presented by Fairchild, who estimated the period of time since the ice retreated from the western section at 30,000 years. The last or Wisconsin ice epoch probably covered a period of 150,000 years in all, while the preceding Glacial and inter-Glacial epochs may have lengthened the whole time for the Pleistocene to 500,000 years or even much more.

The report of the international committee on glaciers for the year 1911 indicated that most European glaciers were in process of retreat, although in the Alps those on the French side of Mont Blanc had recently manifested a tendency to advance. Some of the Scandinavian glaciers were advancing, while others were shrinking. The glaciers on Mount Rainier retreated markedly in the period from 1901 to 1912. The Glacier Bay and Malaspina glaciers of Alaska had also receded; the Grand Pacific glacier in Glacier Bay lost an average of 3300 feet a year between 1907 and 1911 and since 1897 had retreated over 15 miles.

ORE DEPOSITS. An analysis of the evidences regarding the formation of secondary silicate zones on the contacts of intrusive igneous rocks with limestones was given by W. L. Uglow. The subject has a close bearing upon the question of origin of the "contact" ore deposits which have been shown by recent work in the western mining regions to be a very common type of occurrence for iron, copper, and lead minerals. The main interest from the standpoint of origin of the minerals centers about the problem as to whether the silicates and the accompanying ores have been introduced by the igneous intrusions or whether their materials did not already exist in the limestones and have only been segregated and recrystallized by the influence of the heated waters and vapors set in motion by the igneous magma. The conclusion reached from the evidences was that the silicate minerals were largely the result of recrystallization of components that existed in the limestones.

The translation into English of the medieval classic *De Re Metallica* of Georgius Agricola was an achievement in which students of

mining geology will be interested. In its original Latin the work probably has not been frequently consulted, and the German translation is difficult reading to all but those expert in technical terminology. The present rendering is the work of H. C. Hoover and L. H. Hoover.

Among systematic treatises on ore deposits to claim attention may be mentioned the encyclopædic work *Traité de Metallogenie* by the French geologist de Launay, and the American contribution, *Mineral Deposits*, by Lindgren. The issue of the second volume of the German treatise by Beyschlag, *Krusch and Vogt*, should also be noted.

COAL RESOURCES. An exhaustive account of the coal supplies of the world appeared during the year under the auspices of the International Geological Congress. The work covers three large volumes and is a description of the occurrence of coal in 64 countries, each article being contributed by one or more experts for that country. Of general interest is the attempt to summarize the available supplies, the first that has been made on such a scale or with such reliable data. The available resources throughout the world are placed at 7,397,533 million tons, of which 4,000,000 million tons are bituminous, 3,000,000 million tons brown coal, and the rest anthracite. Of the whole amount, the United States is credited with something less than one-half, or in exact figures, 3,214,174 million tons. The other leading countries include Canada with a supply of 1,234,264 million tons; the United Kingdom with 189,535 million tons; Russia with 233,917 million tons; Germany with 85,551 million tons; and France with 17,585 million tons. The present rate of consumption for all countries is less than 1500 million tons, so that there appears to be an abundance of this fuel in the world, although some countries are making quite rapid inroads on their supplies.

GEORGE I., KING OF GREECE. Assassinated at Salonika, March 18, 1913 (see GREECE). King George was the second son of Christian IX., king of Denmark, and was born at Copenhagen in December, 1845. He became king of Greece as a result of the revolution of 1862, which brought about the departure from Athens of King Otho. The throne thus made vacant was first offered to Prince Alfred, afterwards Duke of Edinburgh. The British government, however, refused to allow the acceptance of this offer and it was then offered to the son of the king of Denmark, who accepted it on January 6, 1863. Shortly after his accession he was able to secure for his people, largely through the influence of Mr. Gladstone, a coronation gift in the shape of the Ionian Islands, which for nearly half a century had been a British protectorate. In October, 1867, he married the Grand Duchess Olga of Russia. In spite of constitutional and other difficulties, King George during the earlier part of his reign was unable to accomplish much for the advancement of Greece, but the system of brigandage was broken up, and railways and passable roads were built. On his own property at Tatoi the king showed his subjects an excellent example in farming, viticulture, and forestry. His success in these years was due largely to the assistance and coöperation of M. Tricoupis, his premier. In January, 1895, M. Tricoupis resigned office in consequence of

a disagreement with the crown prince on a question of military discipline. He died fourteen months later, depriving Greece of his guidance at the critical moment of her history. The year 1896 was a great awakening of patriotic sentiment, which found Crete, and the conditions existing there, a fruitful field for its activities. After attempts by the powers to cope with the situation, war between Greece and Turkey broke out in 1897. The campaign was disastrous to Greece from the start and the government was obliged to pay to Turkey a war indemnity of \$20,000,000. The state of the country after the conclusion of hostilities was deplorable, and the dynasty seemed in danger. A reaction, however, set in as a result of an attempt to assassinate King George on February 28, 1898. In the following summer the king made a tour through the country and was everywhere received with enthusiasm. In the autumn of that year the powers, on the initiative of Russia, decided to entrust Prince George with the government of Crete. He continued to hold this office until 1906, when he resigned, and was given the privilege of designating his successor. In October, 1908, the Cretan Assembly proclaimed union with Greece. This led to fresh complications, and the cautious attitude of the Greek government provoked an agitation in the army which came to a head in 1909. On July 18 of that year, a popular demonstration against the prime minister caused his resignation. His successor, M. Ralli, announced a programme of military and economic reform. The army, however, took matters into its own hands and in the name of the Military League placed M. Marvromichalis in place of Ralli. For the next six months the constitutional government was practically superseded by that of the Military League, and for a time the crown itself seemed to be in danger. The league insisted on the removal, as commander-in-chief, of Prince Constantine, heir-apparent, and the removal of the other princes from the army. The king had no choice but to consent. He was obliged to consent also to the removal of two other officers, who loyally resisted the mutiny of the troops under their command. The influence of the league, however, rapidly declined, and a reckless attempt to establish a naval directorship in Athens was quickly stopped. Another attempt by the army and navy to cause trouble in 1910 failed equally, owing to the firmness of the king.

Venezelos, the Cretan leader, suggested the creation of a national assembly and he and King George continued to work together for the regeneration of Greece. Venezelos took part in the negotiations which resulted in the Balkan League and in this had the steady support of the king. After the fall of Salonika, King George went to that city and made a triumphal entry in the early part of March, 1913. On March 18, in company with an equerry, he was returning from a walk, when he was shot by a Greek named Alexandre Skinas.

GEORGETOWN UNIVERSITY. An institution for higher education, under the auspices of the Roman Catholic Church, founded in Washington, D. C., in 1789. The students enrolled in the several departments of the university in the autumn of 1913 were 1533. The faculty numbered 175. There were no noteworthy changes in the faculty during the year,

and no notable benefactions were received. The library contains about 150,000 volumes. The president is Rev. Alphonsus J. Donlon.

GEORGE WASHINGTON UNIVERSITY.

An institution of higher learning in Washington, D. C., founded in 1821 as Columbian University. The enrollment in all departments in the autumn of 1912 was approximately 440. The faculty numbered 192. Profs. Ash, H. W. Wiley, and B. F. Moore resigned in 1913. Prof. Bedford Brown was appointed head of the department of architecture. The funds of the university amount to about \$132,000, and the income to about \$5300. There are about 45,500 volumes in the library. The president is Charles H. Stockton.

GEORGIA. POPULATION. The population of the State in 1910 was 2,609,121. According to the estimates of the Bureau of the Census, made in 1913, the population then was 2,736,737.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	4,066,000	63,023,000	\$57,351,000
	1912	3,910,000	53,958,000	45,864,000
Wheat	1913	140,000	1,708,000	2,050,000
	1912	132,000	1,228,000	1,498,000
Oats	1913	420,000	9,240,000	6,283,000
	1912	364,000	7,571,000	4,921,000
Rye	1913	13,000	124,000	167,000
	1912	11,000	101,000	141,000
Rice	1913	500	16,000	13,000
	1912	900	27,000	24,000
Potatoes	1913	12,000	972,000	1,021,000
	1912	12,000	936,000	814,000
Hay	1913	250,000	a 350,000	6,275,000
	1912	234,000	316,000	5,372,000
Tobacco	1913	1,800	b1,800,000	558,000
	1912	1,400	1,162,000	349,000
Cotton	1913	5,328,000	c2,275,000	139,135,000
	1912	5,335,000	1,776,000	105,266,000

a Tons. b Pounds. c Bales.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$6,306,140, compared with \$6,172,857, in 1911. The total production of coal in 1912 was 227,503 short tons, valued at \$338,426. For the first time in five years, the coal production of the State showed an increase over the preceding year, noteworthy as with the exception of 1912 the production had shown a steady decrease since 1903. This was attributed to the withdrawal by the State of the convicts with which the mines had been operated. The scarcity of free labor in the somewhat isolated district had prevented the mines being worked to their full capacity. The State produces a small amount of iron ore. In 1912 this amounted to 135,337 long tons, valued at \$227,282, compared with 207,279 tons, valued at \$315,704 in 1911. The total value of clay products of Georgia in 1912 was \$2,806,541, an increase of \$170,161 over 1911. The principal product is common brick.

FINANCE. The total receipts for the fiscal year ending December 31, 1912, were \$5,558,447, and the total disbursements were \$5,450,284. At the beginning of the fiscal year, there was a balance of \$618,923, and, at the end of the fiscal year, of \$727,076. The chief sources of revenue are the general taxes, railroad tax, railroad rentals, and license fees. The chief

expenses are for education, for the maintenance of State institutions, and for the expenditures of State government.

TRANSPORTATION. The total railway mileage in the State on June 30, 1912 was 7166 single track, and 80 double. The railways having the largest mileage are the Central of Georgia, 1331; Atlantic Coast Line, 707; Seaboard Air Line, 744; Southern Railway, 909; Atlantic, Birmingham, and Atlantic, 484; Georgia and Florida Railway, 310; Georgia Railroad, 303; and the Georgia, Southern, and Florida Railway, 239.

EDUCATION. The total enrollment in the public schools of the State on December 31, 1912, was 571,230. Of these, 348,571 were white, and 222,659 were colored. The total attendance in the public schools was 357,243, of whom 226,914 were white, and 130,329 were colored. The total number of schools for white children receiving State aid was 4782 and for colored children 3058, or a total of 7840. The schools for white children giving high school courses numbered 1082, and for colored children 58. Teachers in white schools numbered 9053, and in schools for colored children 4052, or a total of 13,105. The total expenditures for educational purposes during the year was \$6,158,526. Of this \$5,094,130 was for the common schools, and \$1,064,106 for higher education. The average annual salary for teachers in the State was \$250.

POLITICS AND GOVERNMENT. The legislature met in 1913. Most of the measures enacted were of local interest and importance. There was no election for State officers during the year. The term of the governor expires on July 1, 1915, but the next election for State officers is in October of 1914. The first election of a senator in any State in accordance with the Seventeenth Amendment, took place in the State on July 15, 1913, when Senator Bacon was reelected without opposition. Not more than 10,000 votes were cast in this election. Senator Bacon's term expired on March 4, 1913, and he was holding over by appointment to await reelection. On November 5 Judge Frank Park was elected representative from the second district to succeed S. A. Roddenberry (q.v.), deceased. On July 15 an inquiry was begun on the administration of Emory Speer, judge of the Federal district of southern Georgia, in accordance with charges made against him. On July 7 a resolution was introduced in the Senate. The chief basis of the charges were alleged abuse of his position as a Federal judge. These charges were considered by the judiciary committee of the House. Judge Speer denounced the inquiry as partisan, and declared that it was brought about by his attack on the spy system. On August 22 Judge Speer was allowed to attend meetings of the judiciary committee with counsel. The House on August 27 passed a resolution authorizing an inquiry into the charges. A committee from the House was appointed to investigate.

The close of the year saw an important event in the development of the negro race. On Sunday night, December 14, over 8000 negroes gathered in a giant mass meeting at the Atlanta Auditorium to raise funds and assure the building of a negro Y. M. C. A. The meeting was the first of its kind ever held in the South, and while all the money

necessary was not raised, the plan was being rapidly pushed to completion, mainly by the negroes themselves, but with the cooperation of a number of well-known white citizens.

See also **LIQUOR REGULATION.**

STATE GOVERNMENT. Governor, John M. Slaton; Secretary of State, Philip Cook; Treasurer, Wm. J. Speer; Comptroller and ex-officio Commissioner of Insurance, W. A. Wright; Attorney-General, Thomas S. Felder; Adjutant-General, J. Van Holt Nash; Superintendent of Education, M. J. Brittain; Commissioner of Agriculture, J. D. Price—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Wm. H. Fish; Presiding Justice, Beverly D. Evans; Associate Justices, J. H. Lumpkin, M. W. Beck, Samuel C. Atkinson, and H. W. Hill; Clerk, Z. D. Harrison—all Democrats.

STATE LEGISLATURE, 1913. Democrats: Senate, 43; House, 183; joint ballot, 226. Republicans: Senate, 1; House, 1; joint ballot, 2. Democratic majority: Senate, 42; House, 182; joint ballot, 224.

The State representatives in Congress will be found in the article **UNITED STATES**, section *Congress*.

GEORGIA, UNIVERSITY OF. A State university for higher education, founded at Athens, Ga., in 1785. The enrollment in all the departments in the autumn of 1913 was 682. The faculty numbered 83. There were no noteworthy changes in the faculty during the year, and no important benefactions were received. The productive funds of the university amount to about \$375,000, and the annual income to about \$140,000. The library contains about 40,000 volumes. The president is D. C. Barrow, LL.D.

GERARD, JAMES WATSON. An American jurist and public official. He was born in Geneseo, N. Y., in 1867, and graduated from Columbia University in 1900. He studied law at that university, receiving the degree of LL.B. in 1902. In the same year he was admitted to the bar. He was for four years chairman of the Democratic campaign committee of New York County. In 1908 he was elected associate justice of the Supreme Court of New York for the term ending 1921. He was appointed ambassador to Germany by President Wilson.

GERMAN ANTARCTIC EXPEDITION. See **POLAR EXPLORATION.**

GERMAN EAST AFRICA. A German protectorate bordering on the Indian Ocean and lying between the British East Africa Protectorate and Portuguese East Africa. The area is officially estimated at 995,000 square kilometers (384,170 square miles). The native population is estimated as 7,510,800. The whites numbered (1912) 4866. There are government and mission schools.

On the German plantations are cultivated coffee, cacao, vanilla, tobacco, rubber, sugar, cotton, cocoanuts, and cardamoms. Gems are found, and there exist various mineral deposits. The imports in 1911 were valued at 45,892,000 marks (23,203,000 from Germany), and the exports at 22,438,000 (11,912,000). In 1910 the imports were valued at 38,659,000 marks and the exports at 20,805,000 (rubber 6,195,000 marks, sisal 3,011,000, copra 1,909,000, ivory 703,000, wax 672,000, etc.). The railways in operation at the end of 1912 had a total

kilometrage of 1199. There were opened for traffic 146 miles of new railway in German East Africa during 1913, 42 miles in the Cameroons, and three miles in Togoland, making a total of 191 miles, as contracted, with an increase of 254 miles in 1912. This gives for German East Africa a total mileage of 2588. At the end of the year it was stated that the Tanganyika railway would probably reach Lake Tanganyika early in 1914, and that, shortly after, through traffic would be undertaken from Dar-es-Salaam to Kigoma.

The budget estimate for revenue 1913-14 was 54,755,315 marks (colonial revenue 16,901,628, imperial contribution 3,603,687, loans 34,250,000). Expenditure, 54,755,315 (civil administration 9,308,782, military 3,615,030, extraordinary—the amount of loans—34,250,000). The governor in 1913 was Dr. Schnee, residing at Dar-es-Salaam (about 26,000 inhabitants).

GERMAN EVANGELICAL SYNOD OF NORTH AMERICA. A religious denomination, founded in 1840 as the Evangelical Association of the West. Its present name was adopted in 1877. The strength of the denomination is greatest in the central and north central States, although it is represented in nearly all the States of the Union. In 1913 the communicants numbered 258,911; the churches 1326; and the ministers 1038. The church property is valued at nearly \$14,000,000, and over \$1,000,000 annually is spent for the maintenance of churches. Missions are maintained in India, where the communicants and adherents of the denomination number about 3500. The official organs of the denomination are *Der Friedensbote* and *The Messenger of Peace*, both issued from the Eden Publishing House at St. Louis. The denomination maintains Elmhurst College at Elmhurst, Ill., and the Eden Theological Seminary at St. Louis. There are charitable institutions for orphans, superannuated ministers, and the widows and orphans of deceased ministers. See **RELIGIOUS DENOMINATIONS AND MOVEMENTS.**

GERMANIC PHILOLOGY. See **PHILOLOGY.**

GERMAN LITERATURE. The literary life of Germany, like that of other countries, seems of late to centre in the drama. Of the numerous prizes offered by the Schiller-, the Kleist-Stiftung, and other funds created to encourage the deserving author, the majority go to the dramatist. Yet the distinction so acquired does not seem materially to strengthen their chances upon the stage. None of the prize-crowned dramatists of 1912 and 1913 have even remotely approached the success of Rössler's *Die fünf Frankfurter*, which has even been imported into America. It is almost pathetic to witness the efforts of writers of undeniable merit in other lines to win the favor of a theatrical audience. Their failures are innumerable; but hope persists and the lure of fabulous royalties and of the widest possible publicity is irresistible.

The year 1913 received its cue and keynote from the one-hundredth anniversary of Germany's uprising against Napoleon, and, although the memory of 1813 had been celebrated in lyric verse by Ernest Lissauer, in a novel *Deutschland marschirt* by Kurt Martens, and in other works, all artistic interest roused by the occasion was directed to the play written by Gerhart Hauptmann for the century exposition at Dreslau. This *Festspiel in deutschen*

Reimen, staged by Reinhardt, was to be the dramatic event of the year. The poet, however, is of the younger generation, and that archaic sentiment which even in popular parlance in his country is significantly styled "Hurrah-Patriotismus," is alien to him. He sees the Napoleonic epoch in the perspective of our time, and skillfully removes the plot and its actors into a sphere where even the mighty of this world are only puppets in the hands of the Master. It was the most dignified expression of the new reading of life applied to events which shook the very foundations of Europe a hundred years ago. But the future sovereign of the German empire did not see the topic of the play in that light, and ordered the discontinuance of the performances.

DRAMA. While Gerhart Hauptmann has in his *Festspiel in deutschen Reimen* given new evidence of his creative imagination, Hermann Sudermann has in *Der gute Ruf* rearranged with the infallible symmetry of a kaleidoscopic contrivance characters and conflicts long familiar to the playgoer who has seen the long line of his works, beginning with *Sodom's Ende*, and has varied his favorite "honor" motive by setting it against a background of Berlin W. depravity. Carl Hauptmann, on the contrary, who has always suffered by comparison with his younger brother, has made enormous strides within the last few years, and the two plays published and performed this year have given him a place of honor among German dramatists of the first rank. *Die lange Jule* is a most powerful peasant drama, with the greed of possession as the central theme, and *Die armen Besenbinder*, a most poetical and fanciful "Marchendrama" with a great ethical truth. Max Halbe has hardly added to his reputation by his *Freiheit*, another play of the Napoleonic anniversary; neither his work nor George Hirschfeld's *Überwinder* fulfills the promise of their early and brilliant débuts. Ludwig Thoma, the sturdy Bavarian, is amazingly prolific and his works are astonishingly even in quality. Since the success of his village drama, *Magdalena*, he has written an unusually strong play of family tyranny, *Die Sippe*, with a cleverly sketched provincial milieu. Frank Wedekind, after having sorely tried even his admirers with *Franziska*, which he chose to call a mystery play, has this year published a *Simon* in verse, which is a very powerful drama of jealousy. Herbert Eulenburg has had a number of performances to his credit, among them that of his *Zeitwende*, in which a curiously romantic character comments upon the action like the fool of medieval or the chorus of antique drama. Heinrich Lilienfein's *Tyrann* and Schalom Asch's *Bund der Schwachen* cannot compare with their earlier works. On the other hand, Stefan Zweig, the gifted Viennese, gave evidence of growth in his drama *Das Haus am Meer*. Max Bernstein, too, who never aims high but always does his best within his limitations, presented a delightful comedy, *Der gute Vogel*. Raoul Auernheimer deftly employed his wonted touch of flippancy in the Viennese comedy *Das Paar nach der Mode*. Franz Adam Beyerlein, the author of the military drama which had a sensational success some years ago, *Zapfenstreich* ("Taps"), entitles his latest play simply *Frauen* ("Women"). Otto Soyka's *Geldzauber* is a comedy founded upon an extravagant carica-

ture of what Europeans chose to call Americanism. Ludwig Fahrenkrog, the painter-poet, has followed up his earlier dramatic venture, *Baldur*, with a new play from Norse lore, *Wölund*. Oskar Kokoschka, the young Viennese painter-poet, has published a volume of curious dramatic studies under the title *Dramen und Bilder*. Among the newcomers whose first performances were received with marked favor are Felix Montanus, the author of a striking historical tragedy *Der Phantast*; Hans Franck, who wrote the three-act drama *Herzog Heinrichs Heimkehr*; Anton Wildgans, who has to his credit the charming one-act piece *In Ewigkeit, Amen*; and Walter Lutz, whose drama *Andreas Hofer* shows pronounced originality. Among the novelists and poets who succumbed to the attraction of the footlights, Gustav Frenssen suffered a dismal failure with his *Sönke Ericksen*. *Gefährliche Liebe*, by Wilhelm von Scholz, *Die grosse Liebe* by Heinrich Mann, and *Das Wundermädchen von Berlin* by Hans Heinz Ewers, may also be classed among experiments that made one regret the waste of energy. That a work by Friedrich Halm, the time-honored author of *Ingomar*, should only now have been resuscitated and had its première, must be recorded as a curiosity, for his *Verbot und Befehl* proved such a successful comedy that one is rather puzzled by the question why it should have been forgotten so long.

FICTION. In fiction as in drama no one work can be singled out as the greatest achievement of the year. But Carl Hauptmann has written a novel which deserves being named first: *Ismail Friedmann* handles the problem of marriage between Jew and Gentile with an admirable delicacy and depth of insight, endows the actors of the firmly constructed, logical plot with a haunting vitality, and is altogether a striking proof of the steady development of the author's genius. Jakob Wassermann, too, has turned out what seems to be his best story, *Der Mann von vierzig Jahren*, which suggests in the life of the strong sex an emotional climacteric identical with the so-called dangerous age of woman—a motive which seems also to have haunted Thomas Mann in his novel *Der Tod in Venedig* and Arthur Schnitzler in his *Frau Beate und ihr Sohn*. An interesting native of that same Silesia which has given us Carl and Gerhart Hauptmann is Hermann Stehr, whose *Geschichten aus dem Mandelhauss* is a story of very pronounced originality, breathing the mystic spiritual atmosphere which bred Jacob Böhm. Hermann Stegemann, the Alsatian, has written a powerful story based upon the tragic problem of that province, *Die Kraft von Illzach*. Bernhard Kellermann, whose name has become identified with the strangely elusive, subtle psychology of his earlier works, has given his admirers a distinct shock by his new book, *Der Tunnel*, which is no less than a story of the building of a tunnel which is to connect Europe and America—a theme which gave him opportunity for a series of graphic pictures of supposedly American life. Gerhard Ouckama Knoop, who has occupied a position quite apart from any of the schools and tendencies of the period, and has in each of his works struck a new individual note, published shortly before his death what seemed still another new departure, a novel of old Munich: *Unter König Max*. Some of the

writers more or less identified with the struggle for new literary ideals a quarter of a century ago, have published new works of varying merit: Carl Bleibtreu, the novel *Weltbrand* and the satirical story *Zwei wackere Helden*; Stanislaus Przybyszewski, who had for some years resumed his native Polish, has returned to the German in *Das Gericht*; Johannes Schlaf, by the very title *Das Recht der Jugend*, suggests a problem story; and Kurt Martens has made a concession to the patriotic mood of the year in his *Deutschland marschirt*. Richard Voss's *Kundry* is in his wonted emotional vein; Ottomar Enking's *Mathias Tedebus* shows his racy quality. Max Geissler, as usual, charms by a certain lyric element in his story *Die Herrgottswiege*. Ernst Zahn, the Swiss novelist, has given us the quaint story of a philosophical apothecary in a provincial town. Traugott Tamm's *Hingstberger* graphically presents the lure of the city. Friedrich Freksa, the author of *Sumurun*, has in his *Erwin Bernstein* written a story of theatrical Berlin. Alfons Petzold, the poet, who has risen from the ranks of simple unskilled workmen, has followed up the success of his poems and prose sketches of a year ago by a novel which reflects his reading of life: *Erde*. Walter von Molo has finished his trilogy of Schiller novels, and Walter Bloem that of the Franco-German War. Clara Viebig, too, has written a semi-historical novel, *Das Eisen im Feuer*, giving a vivid picture of mid-century Berlin. Emmy von Egidy's *Mathias Werner* is the story of a spiritual struggle. Margarete Böhme, who has become known to American readers through *The Department-Store*, has written two more novels that may be classed with "woman novels" of the time: *Christine Immersen* and *Anna Nissens Traum*. Marie Vaërtling has made a successful debut with *Max Treumann's erste Liebe*, Katarina Botaky with an unusually thoughtful book of woman's life, entitled *Sommer und Herbst*, and Angela Langer with what seems an autobiographical document, *Stromaufwärts*. Enrica Handel-Mazzetti's *Brüderlein und Schwesterlein* deals with the tragedy of the young girl fresh from the convent school who is brutally thrust into a thoroughly rotten society life by an ignorant and ambitious mother. Some interesting volumes of short stories and sketches have been published during the year. Wilhelm Hegeler's *Eros* derives its title from the initial story, which is that of a first love, and is an admirable specimen of the author's narrative art. Otto von Leitgeb's *Das Hohelied* is characterized by the refined taste with which he is wont to temper his emotional and imaginative intensity. Alexander Castell, who was credited a year ago with having created in the hero of his novel, *Bernards Versuchung*, the type of a modern "Don Juan," has collected under the title *Capriccio* stories dealing with erotic problems in the artist world and the smart set of Paris, Munich, and other metropolitan centres. A book of curiously fanciful tales of modern life is Hans Bötticher's *Ein jeder lebt's*. Ludwig Thoma's *Nachbarsleute* is a volume of sketches, in which the Bavarian writer depicts the life of peasants and provincials and pokes fun at the poses of city dwellers. Marie Eugénie delle Grazie suggests the serious undernote of her stories in the title *Das Buch des Lebens*, while Bertha von Suttner has chosen for her volume the puzzling *Ku-i-kuk*. Carl Hauptmann has

filled the interval between the completion of his two last plays and his novel and the conception of a new work with the collection of a book of short stories of human lives in various social strata, which he significantly calls *Schicksale*. Peter Altenberg, the whimsical and ultra-modern Austrian, has published a new volume of his brief sketches and impressions under the title *Semmering 1912*. Gustav Meyrink's grim humor and grotesque fancy are unique in modern fiction and the three volumes under the title *Des deutschen Spiessers Wunderhorn*, in which he has collected his tales and sketches, will be among those that will have a permanent place in the library.

POETRY. The fiftieth birthday of Richard Dehmel, who is acknowledged the greatest writer of lyric verse in Germany to-day, has been celebrated by a complete edition of his works, but he has also published a new volume of poems, *Schöne wilde Welt*, which is characteristic of his philosophy and his poetic ideal. Richard Schaukal and Paul Wilhelm, two Austrian poets that came into prominence about the same time as Dehmel did, have also sent out new volumes of *Gedichte*; likewise two Swiss poets of the same generation, though not of the same tendencies, Adolf Frey and J. C. Heer. Georg Busse-Palma entitles his new volume of verse *Zwischen Himmel und Erde*. The peasant-poet Christian Wagner-Warmbrunn has sent out two volumes of verse, one of them recording his impressions of Italy. Several new Austrian voices have joined the choir: Wladimir von Hartlieb with two books of verse, *Anima Candida* and *Gott fordert dich*, that have a touch of the Whitman spirit and occasionally skillfully demonstrate the strength of the Whitman "strophe"; Anton Wildgans with a volume of sonnets, *Sonnette an Ead*, in which he sings the praise of woman; and Alfons Petzold, whose rise from the ranks of labor to literary prominence has been much commented upon, has given us a book of thoughtful lyrics, *Heimat Welt*. Other poets that have recently come into prominence are Willy Alexander Kastner with his *Weltwahn*, Franz Werfel with his emphatic *Wir sind*, Heinrich Ehrler with the tender *Briefe an ein Mädchen*, Albert Rausch, whose *Vigilien* attracted attention two years ago, with a *Buch der Trauer*. A German-American poet who passed away during the year, Udo Brachvogel, had just collected the poetical gleanings of a life-time: *Gedichte*. A posthumous volume by Georg Heym, a young poet whose untimely death is deeply lamented, is *Umbra vitæ*. Alberta von Puttkammer, who as a poet ranks close to Ricardo Huch, has, after some years of silence, published a volume entitled *Mit vollem Saitenspiel*, and Erika Rheinsch, whose verse has been attracting attention in the magazines, has collected her poems under the title *Die Laute*.

ESSAYS, CRITICISM, ETC. Of the extent of literary study in Germany nothing gives a better idea than the amazing number of critical, analytical, and appreciative essays annually turned out either in slim paper-covered booklets or in more ample and ambitious volumes. The centenary of Hebbel has been productive of a number of such studies, among them Lahnstein's treatise on Hebbel's ethics and mysticism, Bruns's study of the relation between Hebbel and Ludvig, Kutscher's of Hebbel and Grabbe, Walzel's of the dramas of Hebbel, and Dr. Ludwig Lewin's *Hebbel: ein Psychogramm*. Theo-

dor Storm is the subject of a volume of intimate reminiscences by Gertrud Storm, and Dr. Peter Hanssen has written on Storm's relation to medicine. Dr. Ernst Jentsch has looked into the pathological traits of Otto Ludwig. Hans Dünnebieber has written on the relation between Ludwig Feuerbach and Gottfried Keller. Ernest Caffi compares Nietzsche and Macchiavelli. Oskar Walzel has treated the subject of Wagner in and after his time. Alfred Markowitz has written about Ibsen's reading of life and Dr. M. Bienenstock about his views of art. Two more books have been added to the literature growing up about Gerhart Hauptmann, and Robert Ress has seen fit to write a book about the cultural significance of Arno Holz. Carl Bleibtreu, who some years ago wrote a play about Byron, has now published a book called *Das Byron Geheimniss*. Otto Harnack has written about Wilhelm von Humboldt. There are books on Lessing's educational importance, Jean Paul's personality, Friedrich Schlegel, Friedrich Matthiessen, Solomon Gessner, Theodor Körner, Eduard Müricke, Gottfried Keller, Wilhelm Jensen, Arthur Fitger, Paul Heyse, Felix Dahn, J. V. von Scheffel, Robert Hamerling, Hermann Bahr, Rainer Maria Rilke, Ernst Hardt, Thomas Mann, Richard Dehmel, Ernst von Wildenbruch, Gertrud Pfander, and on foreign writers, among them Balzac and Verlaine. Most delightful books of miscellaneous essays were those by Hermann Bahr, *Essays*; Felix Salten, *Gestalten und Erscheinungen*, and one of unusual literary distinction, Felix Popenberg's *Masken*.

BIOGRAPHIES, LETTERS, MEMOIRS. A monumental biography is that by Heinrich Spiero: *Detlev von Liliencron, sein Leben und seine Werke*. Other biographical volumes are Litzmann's *Wildenbruch*, Richard Maria von Werner's *Hebbel*, and Anton X. Schurz's *Lenau*. A book of more than biographical scope is Hans Landsberg's *Henriette Herz und ihre Zeit*. Among the letters important for their human significance, as for their literary quality, are the two volumes, *Caroline: Briefe aus der Frühromantik*, and *Karoline Michaelis: Auswahl aus ihren Briefen*. The curiously interesting character of the diplomat Gentz is reflected in the collection of his letters, which, with his book on *Rahel Varnhagen und ihre Zeit*, are valuable contributions to the history of that period. There is also a volume of reminiscences of Ernst Moritz Arndt and a book of letters by Immanuel Kant. Julius Hart's *Kleistbuch* is a sympathetic memoir. August Sauer's *Grillparzer's Gespräche* is a valuable supplement to the biography of the poet; Richard Wagner figures on the title-page of a volume, *Wagner: sein Leben in Briefen*. An autobiographical volume by Peter Rosegger is entitled *Mein Wellleben*. Max Dauthendey's *Gedankengut aus meinen Wanderjahren* is an absorbingly interesting record of the spiritual evolution of the young generation in Germany.

GOETHE AND SCHILLER LITERATURE. There seems to be no limit to the books written about Goethe. Georg Simmel presents a life, Hermann Brandt studies his relation to the graphic arts, Ernst Maas to antiquity, G. Chr. Hirsch to biology. Max Wundt has written about *Wilhelm Meister* and the new reading of life. Eduard von der Hellen has edited a new collection of Goethe letters. J. Alex. Baumgartner's *Goethe, sein Leben und seine Werke*, has gone

into a third, much revised edition; Harry Maync has compiled a history of Goethe bibliography, and a bibliography of original editions of works by other authors published during Goethe's lifetime seems to stretch the subject about as far as it can go. There have been books on Schiller and his idealism by Dr. Felix Kuberka, on Schiller's theory of beauty by Johann Tiedge, on his aesthetics of tragedy by Wilhelm Bolze, on Schiller in his talk by Biedermann, and Georg Wittkowski has reëdited Streicher's account of Schiller's flight from Stuttgart.

LITERATURE, HISTORY. The term coined by Goethe, "Weltliteratur," occurs on the title-page of no less than four works recently published: Adolf Bartels has written an introduction to the history of the world's literature, Carl Busse a *Geschichte der Weltliteratur* in two volumes, Paul Wiegler a book on the same subject, and Richard Meyer a *Geschichte der Weltliteratur im 20. Jahrhundert*. Heinrich Spiro has written a *Geschichte der deutschen Frauenbildung seit 1800*, which should prove a valuable contribution to the history of woman's progress. In this connection it is interesting to note that the most important historical work of the year is considered to be Ricarda Huch's story of the Thirty Years' War: *Der grosse Krieg in Deutschland*.

SCIENCE, NATURE, ART, TRAVEL, ETC. Dr. Sigmund Freud's *Totem und Tabu* establishes some startling relations between the concepts of primitive savages and the neurotic phenomena of civilized races. Walter Rathenau has written a book entitled *Zur Mechanik des Geistes*. Wilhelm Bölsche's *Stirb und Werde* is a delightful book of nature studies. A curious contribution to archaeology is *Im Palast des Minos*, by "Sir Galahad." George Kutzke's *Aus Luther's Heimat* is devoted to the country of Luther and the Luther landmarks. Interesting books of travel are Emil Ludwig's *Afrika*, Hermann Hesse's *Indien*, and Arthur Achleitner's *Reise im slavischen Süden*. The theatre comes in for an astonishingly large number of books: Julius Bab's *Nebenrollen*, Monty Jacobs's *Deutsche Schauspielkunst*, Willy Rath's *Kino und Bühne*, Ferdinand Gregori's *Maskenkünste*, and a volume of dramatic criticisms by the late Otto Brahm. The renaissance of the art of dancing is treated in Hans Brandenburg's *Der moderne Tanz*, which traces the development of modern dancing back to Delsarte and Isadora Duncan. Theological controversy of recent years is revived by the posthumous publication of Carl Jatho's *Zur Freiheit seid ihr berufen* and his reformation sermon preached in 1910. Bruno Wille has compiled an anthology of philosophy entitled *Lebensweisheit*.

GERMAN NEW GUINEA. A German protectorate, including Kaiser-Wilhelmsland and the Bismarck Archipelago. The area is officially estimated at 240,000 sq. kilometers (92,664 sq. miles). The native population is estimated at 609,200; whites in 1912, 1278. Capital, Rabaul, in Neu-Pommern. The total imports in 1911 amounted to 5,299,000 marks (from Germany, 2,553,000 marks), and the exports to 4,109,000 (3,330,000). Vessels entered, 717, of 468,000 tons. The budget for 1913-14 balanced at 3,413,997 marks, including 1,419,031 marks imperial subvention. The governor in 1913 was Dr. Hahl.

Administratively attached to German New Guinea are the Caroline, Palau, Mariana, and

Marshall groups of islands, estimated to cover 2572 sq. kilometers (996 sq. miles), and to contain about 53,000 inhabitants. Imports and exports (1911) of the Marshall Islands, 987,000 and 406,000 marks respectively; of the other groups, 1,720,000 and 860,000.

GERMAN SAMOA. A German protectorate in the southern Pacific, consisting of the islands of Savii (652.9 sq. miles), Upolu (335.5), Manono (3.3), and Apolima (1.8): 993.5 sq. miles in all. Population, 37,480 natives; whites, 500. The imports in 1911 were valued at 4,066,000 marks (855,000 marks from Germany), and the exports at 4,390,000 (2,125,000). Vessels entered, 132, of 141,000 tons. The budget for 1913-14 balanced at 1,132,804 marks. The governor in 1913 was Dr. Schultz, residing at Apia, in Upolu.

GERMAN SOUTHWEST AFRICA. A German protectorate lying between Angola and the Cape Province. The area is officially estimated at 835,100 sq. kilometers (322,432 sq. miles). Estimated native population, 87,770; whites in 1912, 14,816. Stock-raising is the leading occupation, the number of livestock (1910) being as follows: 121,139 cattle, 343,989 sheep, and 327,095 goats. In the neighborhood of Lüderitzbucht diamond mines are worked, the output for the year ending March 31, 1911, totaling 814,322 carats. The imports for 1911 amounted to 45,302,000 marks (37,259,000 from Germany), and the exports to 28,573,000 (24,360,000 to Germany). The leading exports were diamonds, valued at 23,034,000 marks, copper 3,754,000, lead 346,000, skins 324,000, ostrich plumes 80,000, wool 74,000. Vessels entered (1911), 401, of 1,295,000 tons. There were 2104 kilometers of railway in operation at the close of 1912. There was active discussion during the year of projects to increase the railway system. A line into Amboiland received the sanction of the Reichstag and an extension of the Swakopmund-Windhuk line to Gobabis, about 62 miles from the Anglo-German frontier, was proposed, traversing, as it would, a region of remarkable fertility. The third line proposed was an extension of the Lüderitzbucht railway to Keetmanshoop and to Hansuur so as to unite this system with the railway system of the South African Union. The budget for 1913-14 balanced at 54,141,672 marks, including 14,626,840 marks imperial subvention. The governor in 1913 was Dr. Seitz, residing at Windhuk.

In accordance with an imperial decree of June 26, 1913, the Landesrat met in November for the first time in its existence as a real legislative body, its functions having hitherto been confined to advice and consultation. In financial matters the Landesrat is still without authority. Further reform of the government is demanded by the local press, especially as concerns the membership of the Landesrat, which at present is half elective and half appointive.

GERMANY. The German Empire, extending from France to Russia, consists of twenty-five federated states and an imperial territory (Reichsland). The capital is Berlin.

AREA AND POPULATION. The area in square kilometers and equivalent square miles, and the population present according to the census of December 1, 1910, are shown by states in the following table (*k* kingdom, *g* grand duchy, *d* duchy, *p* principality, *fc* free city, *r* Reichsland); under Prussia are shown the constituent prov-

inces and territory of Hohenzollern, and under Bavaria are shown Bavaria proper (that is, the eastern part) and the detached Palatinate (west of the Rhine):

The estimated population of the empire and of the Zollgebiet, on June 30, 1912, was 66,096,000 and 66,341,000 respectively; on June 30, 1913, 66,835,000 and 67,082,000. Of the 1910 population, 32,040,166 were males, and 32,885,827 females. The foreign population at the 1910 census was 1,259,873 (716,994 males, 542,879 females), of whom 634,983 were Austrians, 144,175 Dutch, 137,697 Russians, 104,204 Italians, 68,257 Swiss, 32,079 Hungarians, 26,233 Danes, 19,140 French, 18,319 British, and 17,572 Americans.

The population in 1910, 64,925,993, was divided among 75,939 communes (*Gemeinde*). Communes with less than 100 inhabitants numbered 15,013, with a total population of 822,406; communes with 100 to 499 inhabitants, 40,516, with a population of 10,250,420; communes with 500 to 999 inhabitants, 11,686, with a population of 8,090,857; communes with 1000 to 1999 inhabitants, 4984, with a population of 6,790,904; communes with 2000 to 4999 inhabitants, 2441, with a population of 7,297,770; communes with 5000 to 19,999 inhabitants, 1028, with a population of 9,172,333; com-

munes with 20,000 and less than 100,000 inhabitants, 223, with a population of 8,677,955; communes with 100,000 or more inhabitants, 48, with a population of 13,823,348. Communed population of the larger cities December 1, 1910: Berlin, 2,071,257 (Greater Berlin, 3,710,000); Hamburg, 932,116; Leipzig, 626,267; Munich, 608,375; Dresden, 551,697; Cologne, 516,527; Breslau, 514,765; Frankfurt-on-the-Main, 414,576; Düsseldorf, 358,728; Nuremberg, 333,142; Charlottenburg, 305,978; Hanover, 302,375; Essen, 294,653; Chemnitz, 287,807; Stuttgart, 286,218; Magdeburg, 279,629; Bremen, 247,437; Königsberg, 245,994; Stettin, 237,419; Neukölln (formerly Rixdorf), 237,289; Duisburg, 220,483; Dortmund, 214,226; Kiel, 211,627; Mannheim, 206,049; Halle, 180,843; Strassburg, 178,891; Berlin-Schöneberg, 172,823; Altona, 172,628; Danzig, 170,337; Elberfeld, 170,195; Gelsenkirchen, 160,513; Barmen, 160,214; Posen, 156,601; Aachen (Aix-la-Chapelle), 156,143; Cassel, 153,196; Brunswick, 143,552; Bochum, 136,931; Karlsruhe, 134,313; Lichtenberg, 133,141; Krefeld, 129,406.

In 1910, persons unmarried numbered 38,107,944 (19,516,340 males and 18,591,604 females), married 23,220,713, widowed 3,450,548, and divorced or separated 137,788. Protestants numbered 39,991,421 (61.59 per cent. of the total population); Roman Catholics, 23,821,453 (36.60); other Christians, 283,946 (0.44); Jews, 615,021 (0.95); others, 214,152.

In 1910, marriages per thousand inhabitants were 7.7 and in 1911 7.8; births, 30.7 and 29.5; deaths, 17.1 and 18.2; living births, 29.8 and 28.6. Of the births, 2.9 per cent. were stillbirths in 1910, and 3.0 per cent. in 1911; illegitimate, 9.1 per cent. and 9.2 per cent. Movement of the population from 1908 to 1911:

	1908	1909	1910	1911
Marriages.....	500,620	494,127	496,396	512,819
Births *.....	2,076,660	2,038,357	1,982,836	1,927,039
Stillbirths.....	61,607	60,079	58,057	56,295
Deaths *.....	1,197,098	1,154,296	1,103,728	1,187,094

* Including stillbirths.

In recent years the birth rate has shown a marked decline. In 1876 it was 42.6; in 1886, 38.5; in 1896, 37.5; in 1906, 34.1; in 1909, 32.0; and in 1911, 29.5.

In 1910, German emigrants numbered 25,531; in 1911, 22,690; in 1912, 18,545, of whom 13,706 were bound for the United States, 891 for Canada, 225 for Brazil, 3307 for other American countries, and 322 for Australia.

EDUCATION. Probably no country in the world takes higher rank than Germany in general educational development. Illiteracy is almost negligible. In 1901, there were 59,187 public elementary schools, with 124,027 male teachers, 22,513 female teachers, and 8,924,779 pupils. In 1911 the public elementary schools numbered 61,557, with 148,217 male teachers, 39,268 female teachers, and 10,309,949 pupils (5,157,446 boys and 5,152,503 girls); in addition, there were 480 private elementary schools, with 26,151 pupils (11,894 boys and 14,257 girls). Ranking next above the elementary schools are the middle schools, statistics of which for 1911 are: Public middle schools, 914; private middle schools, 1135; male teachers, 5147 and 1131; female teachers, 2384 and 3403; pupils, 273,394 and 80,660 (boys, 135,799 and 21,873; girls, 137,595 and 58,787). In 1911 there were 524 gymnasias, with 160,237

students; 223 realgymnasias, with 70,357; 167 oberrealschulen, with 75,832; 81 progymnasias, with 9509; 63 prorealgymnasias, with 7252; 411 realschulen, with 80,968; 218 other secondary schools for boys, with 14,489; 39 gymnasias for girls, with 22,137 students; 789 higher schools for girls, with 212,324. There are 11 degree-conferring technical high schools, with 16,187 students in the winter semester of 1912-13. In the 22 universities (including the medical Kaiser-Wilhelm Academy at Berlin and the Posen Academy) there were in winter semester of 1912-13 69,277 students (including 9965 non-matriculated). In addition to the institutions mentioned, there are many schools for technical and special education.

AGRICULTURE. The area of the empire is 54,085,760 hectares, of which in 1907 farm land comprised 43,106,486 ha.; of the farm land, 31,834,874 hectares (73.0 per cent.) were under cultivation, 7,679,754 ha. (17.8) were profitable forest land, and 3,591,858 ha. (8.3) were poor pasture, waste land, yards, etc. The land under cultivation consisted of arable land, 24,432,354 ha. (56.7 per cent. of total farm land); meadows and sown pastures, 6,805,436 ha. (15.8); gardens, 481,716 ha. (1.1); and vineyards, 115,368 ha. (0.3). As compared with 1895, the year 1907 showed an increase in waste and forest land and a slight decrease in cultivated land; and in the later year, 27.95 per cent. of the population were supported by agriculture, against 34.9 in the former.

For some of the principal crops, the area harvested, in thousands of hectares, and the yield in metric quintals, in 1912 and 1913, with the yield per hectare in 1912, are shown below:

	1000 ha.		Quintals		Qs. ha.
	1912	1913	1912	1913	
Wheat	1,926	1,974	43,606,240	46,559,560	22.6
Rye	6,268	6,414	115,982,890	122,223,940	18.5
Barley	1,590	1,654	34,819,740	36,732,540	21.9
Oats	4,387	4,438	85,201,830	97,139,650	19.4

Some of the other important crops in 1911 and 1912, with yield per hectare in 1912, were as follows:

	1000 ha.		Quintals		Qs. ha.
	1911	1912	1911	1912	
Potatoes....	3,321	3,341	343,742,250	502,094,660	150.3
Spelt.....	282	283	4,027,290	4,070,320	14.4
Hay.....	5,932	5,921	199,753,240	276,818,600	46.8
Vines*.....	110	109	2,922,886	2,019,392	18.6

* Production in hectoliters of most.

In 1911, 26,658 ha. were under hops, which yielded 106,277 qs. (27,460 ha. and 204,110 qs. in 1910); in 1911, 17,017 ha. were sown to tobacco, yield, 291,809 qs. The sugar beet is a valuable crop. For Prussia, the harvest area in 1912 and 1913 was 426,327 ha. and 443,240 ha.; yield, 129,632,150 ha. and 136,254,830 ha.; yield per ha., 304.1 ha. and 307.4.

The results of the livestock census of December 2, 1912, in comparison with that of December 2, 1907, were as follows: Horses, 4,523,059 in 1912 and 4,345,047 in 1907; mules and hinnies, 1883 and 942; asses, 11,264 and 10,349; cattle, 20,182,021 and 20,630,544 (cows and heifers, 10,944,238 and 10,966,998); sheep, 5,803,445 and 7,703,710; swine, 21,923,707 and 22,146,532; goats, 3,410,396 and 3,533,970; poultry, 82,702,030 and 77,103,045; beehives, 2,630,837 and 2,594,690. Slaughter in 1912: Oxen, 523,149; bulls, 421,772; cows, 1,727,621;

calves over three months, 961,452; calves up to three months, 4,360,326; swine, 18,196,343; sheep, 2,263,423; goats, 467,858; horses, 178,961; dogs, 8132.

MINERALS AND METALS. Included in the figures of Germany's mineral and metal productions are those of the grand duchy of Luxembourg. The principal mining products, in thousands of metric tons, values in thousands of marks, are shown in the following table:

	1000 metric tons		1000 marks	
	1910	1911	1910	1911

The total value of all mining products in 1911 was 2,085,566,000 marks; in 1910, 2,008,708,000; in 1902, 1,235,759,000; in 1892, 711,695,000. The output of salts from solution in 1911 was 1,892,000 metric tons (1,769,500 in 1910), valued at 130,103,000 marks (115,497,000 in 1910); of which common salt, 651,000 tons, valued at 17,838,000 marks, and potassium chloride, 838,400 tons, valued at 83,410,000 marks.

Important reduction products, in thousands of metric tons, valued in thousands of marks:

Total.....	72,558	28,050	72,768	28,159

On January 1, 1913, the merchant marine included 4850 sea-going vessels, of 3,153,724 tons, of which 2098 vessels, of 2,655,496 tons, were steamers. The registered tonnage of Hamburg was 1,797,508; Bremen, 902,221; Prussia, 298,584; Lübeck, 52,786; Aldenburg, 60,402; Mecklenburg, 42,223; total, 3,153,724 (as compared with 3,023,725 in 1912 and 2,825,449 in 1909).

COMMUNICATIONS. The railways in operation on March 31, 1913, were as follows (normal gauge, narrow gauge, and totals in kilometers):

	Owned or operated by:	Norm. g.	Nar. g.	Total
Prussia	38,790	240		39,030
Bavaria	8,034	115		8,149
Saxony	2,814	508		3,322
Württemberg ..	1,997	101		2,098
Baden	1,754	28		1,782
Mecklenburg	1,094			1,094
Oldenburg	652			652
Prussia (Royal Military Ry.)	71			71
Imperial government in Alsace-Lorraine ..	2,022	78		2,100
Government railways.....	57,228	1,070		58,298
Private railways.....	3,577	1,143		4,720
Total in 1913.....	60,805	2,213		63,018
Total in 1912.....	59,992	2,215		62,207
Total in 1911.....	59,259	2,178		61,437

The foregoing totals for 1913, in miles:

Government railways.....	35,560	665	36,225
Private railways.....	2,223	710	2,933
Total in 1913.....	37,783	1,375	39,158
Total in 1912.....	37,278	1,376	38,654

During 1913 there was more than the usual activity in railway construction in Germany. At East Frankfort O. M. a new station was opened in March. Along the Belgian frontier the Stavelote Malmédy Railway was under construction with a tunnel 547 yards in length, while in Bavaria the Mittenwald Hydro-Electric

Railway, which passes over a 3500-foot summit, and was 70 miles in length, was in progress. The Berlin city line extensions, which at the end of the year comprised 23 miles, were still in progress. Electrification was being undertaken on a number of lines and on the Dessau-Ritterfeld line was almost completed between Leipzig and Magdeburg.

Telegraphs are owned by the imperial government except in Bavaria and Württemberg; these kingdoms operate, under certain limitations, their own telegraphs and posts. In addition to the State telegraphs, there are railway and some private lines. In 1912 there were in the empire, exclusive of Bavaria and Württemberg, 37,369 telegraph offices (32,238 State, 5131 railway, etc.); in Bavaria, 8538 (7147 and 1391); in Württemberg, 2260 (2239 and 21); total, 48,167 (41,624 and 6543). State telegraph lines in 1912: Imperial, 191,679 kilometers (with 612,889 km. of wire); in Bavaria, 29,186 (81,433); in Württemberg, 11,225 (19,217); total, 232,090 (723,539). There were reported 15 wireless stations and 213 on board ship. Post offices in 1912: Imperial, 34,690; in Bavaria, 5308; in Württemberg, 1194; total, 41,192 (in 1911, 40,987).

FINANCE. The monetary unit is the mark, par value, 23.821 cents. The imperial budget for the year ended March 31, 1913, balanced at 2,886,135,087 marks (including extraordinary revenue and expenditure balancing at 134,473,100 marks). The budget for the fiscal year 1914, pursuant to laws of May 4 and July 3, 1913, balanced at 3,696,033,215 marks (including revenue and expenditure balancing at 118,634,500 marks). Of the extraordinary estimated revenue for the fiscal year 1914, loans accounted for 115,458,148 marks. For that year the larger estimated receipts were: Customs, excise, stamps, etc., 2,086,580,894 marks (customs, 721,470,000; military contributions, 416,787,000; imperial stamps, 226,722,000; spirits excise, 195,455,000; sugar, 157,600,000; beer, 124,780,000; etc.); matricular contributions of the several States (exclusive of their contributions from spirits excise), 51,940,794; posts and telegraphs, 842,369,000; railways, 153,779,000. Larger estimated disbursements for the fiscal year 1914, including ordinary (permanent and transitory) and extraordinary: Military administration, 1,368,685,243 marks (against 827,795,405 marks estimated for the fiscal year 1913); posts and telegraphs, 734,533,884 (714,009,235); administration of the navy, 480,253,894 (470,433,623); general direction of finance, 290,168,213 (97,707,127); debts of the empire, 243,557,366 (240,032,521); interior, 159,148,032 (123,017,171); pensions, 142,542,052 (143,411,248); administration of the railways, 139,671,611 (124,343,651); imperial treasury, 43,975,875 (44,026,356).

In October, 1912, the interest-bearing debt of the empire was 4,802,242 marks, having decreased 21,414,700 marks since October, 1911. The non-interest-bearing debt was: Treasury bonds, 160,000,000 marks (having decreased 140,000,000 marks); paper money, 120,000,000. Total debt, 50,082,242,000 marks (the decrease from 1911 being 161,414,700). A war fund of 120,000,000 marks in gold is kept at Spandau.

ARMY. On October 1 the scheme of organization came into effect whereby the German army was to consist of 651 battalions of infantry, 555 squadrons of cavalry, 633 batteries of

field artillery, 226 batteries of heavy and fortress artillery, 44 battalions of pioneers, 21 battalions of railway troops, and 26 battalions of train, all of these units being maintained at a high peace effective which was to range from 835,000 to 870,000 men, according to the season of the year.

The developments of the year provide for the utilization of reservists in the ranks of the existing forces when they are called upon to take the field, and the provision of additional officers to organize the reserve units to be maintained on a cadre basis.

The new law carried an effective budgetary strength for the German army, as follows: 36,000 officers, 110,000 non-commissioned officers and 661,000 soldiers, in addition to 6000 civilian employes, and 4000 employes of low rank, and 18,000 volunteers for one year—in other words, a total of 835,000 men, which will be increased to 870,000 men at the beginning of spring by the incorporation of extra men to increase the effective strength.

The law dealt with the organization of the various units and the methods by which they were to be increased. The organization of the German army was in 25 corps, which were grouped in eight inspection commands, instead of seven, as previously, the new inspection including the three army groups of the east of the empire, the II., V., and VI. This division, following the institution of the seventh inspection command, reduces the number of corps under the command of a single general to three, and will increase his responsibility for the discipline and control of such armies, rather than merely handling a number of grand units in municipalities, as hitherto. The number and distribution of the 25 corps and their division into inspection districts was as follows:

First inspection, I. (Königsberg), XVII. (Danzig), XX. (Allenstein); 2nd inspection, guard (Berlin), XII. and XIX. (Saxon contingent); 3rd inspection, VII. (Münster), IX. (Altona), X. (Hanover); 4th inspection, III. (Brandenburg), and 3 Bavarian corps; 5th inspection, VIII. (Coblenz), XIV. (Baden contingent), XV. (Strassburg); 6th inspection, IV. (Magdeburg), XI. (Cassel), XIII. (Württemberg contingent); 7th inspection, XVI. (Metz), XVIII. (Frankfort), XXI. (Saarbrücken); 8th inspection, II. (Stettin), V. (Posen), VI. (Breslau).

Military service in the German army is compulsory for every citizen, with certain exceptions, from the 10th to the 45th year, the theoretical arrangement being seven years in the regular army, either with the colors or in the reserve, five years in the first levy of the Landwehr, ten years in the second levy of the Landwehr, and finally with the Landwehr home defense army until the completion of the citizen's 55th year. In practice the recruit spends two years with the colors in all branches of the service excepting the cavalry and horse artillery, where it is three years, and then remains in the reserve for the remainder of the seven years.

It is estimated that more than one-half of the able-bodied men in Germany have altogether escaped military service, but this proportion was to be affected by the new law, despite the larger proportion required for training. The total war strength of Germany in 1913 was estimated at approximately 4,350,000 men, which included the standing army with its reserve, the Landwehr,

and the trained men of the Landsturm, with a highly trained and vigorous first line amounting, however, to not more than 1,800,000 men ready for immediate service. See also **MILITARY PROGRESS.**

NAVY. Number and displacement of warships of 1500 or more tons, and of torpedo craft of 50 or more tons, built and building, December 1, 1913: Dreadnoughts (battleships having a main battery of all big guns, that is, 11 or more inches in calibre): built, 13, of 285,670 tons; building, 6, of 162,300 tons. Pre-dreadnoughts (battleships of about 10,000 or more tons, whose main batteries are of more than one calibre): built, 20, of 242,800 tons; building, none. Coast-defense vessels (including smaller battleships and monitors): built, 2, of 8168 tons; building, none. Battle cruisers (armored cruisers having guns of largest calibre in main battery and capable of taking their place in line of battle with the battleships): built, 4, of 88,974 tons; building, 3, of 84,000 tons. Armored cruisers: built, 9, of 94,245 tons; building, none. Cruisers (unarmored warships of 1500 or more tons): built, 40, of 145,847 tons; building, 4, of 21,886 tons. Torpedo-boat destroyers: built, 130, of 67,094 tons; building, 12, of 7200 tons. Torpedo boats, none built or building. Submarines: built, 24, of 10,540 tons; building, 12, of 9484 tons. Total tonnage: built, 943,338; building, 284,870. Excluded from the foregoing: Ships over twenty years old from date of launch unless reconstructed and rearmend within five years; torpedo craft over fifteen years old; transports, colliers, repair ships, torpedo depot ships, and other auxiliaries; vessels not actually begun or ordered although authorized. Germany is second among the nations (the United Kingdom being first) in amount of warship tonnage completed and also in the aggregate tonnage built and building.

Officers and men in 1913, 73,396, including 2 admirals of the fleet, 5 admirals, 11 vice-admirals, 22 rear-admirals, 356 captains and commanders, and 1881 other line officers.

Of the 13 dreadnoughts built, two were completed in 1909, two in 1910, three in 1911, three in 1912, and three in 1913. Those completed in 1913 are the *Kaiserin*, *König Albert*, and *Prinz-regent Luitpold*. These ships, like the *Kaiser*, finished in 1912, carry a main battery of ten 12-inch guns, all of which may be fired on either broadside. Of the six dreadnoughts building, three were launched in 1913, the *König* on March 1 at the imperial yard, Wilhelmshaven, the *Grosser Kurfürst* on May 5 at Hamburg, and the *Markgraf* on June 4 at Bremen. Of the battle cruisers built, one, the *Seydlitz*, was completed for service in October, 1913; of the three building, the *Derfflinger* was launched at Hamburg on July 1, 1913. See also **BATTLESHIPS and NAVAL PROGRESS.**

GOVERNMENT. The imperial legislature consists of the Bundesrat, or federal council (61 members chosen by the government of the several states) and the Reichstag (397 members elected for five years by direct vote). The executive authority is vested in the king of Prussia under the title of German emperor. In 1912, the emperor was William II.; he was born January 27, 1859, and succeeded to the throne June 15, 1888. Heir-apparent, Prince Frederick William, born May 6, 1882; the frequent and unintelligent manifestations of his jingo tendencies have become a cause of alarm in Germany. The imperial ministers, or sec-

retaries of state, do not form a ministry proper, but act independently of each other under the general supervision of the imperial chancellor. The chancellor, who is president of the Bundesrat, is appointed by the emperor without reference to the political majority in the Reichstag, and to the emperor he is directly responsible. Imperial chancellor (and Prussian prime minister) in 1913, Theobald von Bethmann-Hollweg (from July 14, 1909). The imperial secretaries of state in 1913 were: Secretary of state for foreign affairs, Gottlieb von Jagow (succeeding Alfred von Kiderlin-Waechter, who died December 30, 1912); interior, Klemens Delbrück (from July 14, 1909); marine, Grand Admiral Alfred von Tirpitz (from June 15, 1897); justice, Hermann Lisso (from November 1, 1909); treasury, Hermann Kühn (from March 16, 1912); posts and telegraphs, Reinhold Kraetke (from 1901); colonies, Wilhelm Solf (from December 20, 1911).

HISTORY

THE CENTRE AND THE GOVERNMENT. By refusing to suspend the Jesuit law of 1872, the Bundesrat, in November, 1912, had seriously offended the Clericals, and von Bethmann-Hollweg appeared to have lost the support of the Centre party in the Reichstag. When that body met on January 8, 1913, to discuss the budget, the Centre lost no opportunity to censure the government's policy; first it was found insufficient in the matter of social legislation; then it was assailed for brutality toward the Poles. On January 30 the Centre combined with Social Democrats, Poles, Danes, and Alsations to declare lack of confidence in the ministry, and subsequently the same combination struck out the appropriations in the imperial budget for military and postal administration in the East Mark. The chancellor, however, denied the right of the Reichstag to interfere with what seemed to him to be a purely Prussian question, and the Prussian government continued its policy of expropriating the Poles and encouraging German colonization in Posen. Some 200 millions of marks were appropriated for that purpose in the Prussian budget of the present year.

The Centre might be defied by the Prussian government in the Polish question, but it was none the less resolute in demanding the abrogation of the obnoxious restrictions on the Jesuits. On February 19 a Centrist bill for the suspension of the Jesuit law was defended by Dr. Spahn on the ground that the Jesuits were neither political agitators, nor intolerant toward Protestants, nor immoral, and should not be subjected to exceptional laws. The bill passed all three readings on the votes of Centrists, Poles, Alsations, Danes, and Social Democrats, and was referred to the Bundesrat. The Centre then consented to coöperate with the government, and on April 28 the budget debate was brought to a conclusion.

THE ARMY INCREASE. When the Reichstag resumed its labors on May 27 after almost a month's vacation the centre of interest had shifted from clerical politics to the government's proposals for increasing the army. An army bill, together with five bills to provide new funds for military expenditure, had been passed by the Bundesrat on March 28 and introduced in the Reichstag on April 7. Considered from

the point of view of the increased burdens placed upon the German people, or from the point of view of the pacifist, this new addition to the burden of taxation and the new impetus to militarism might indeed be inexcusable, but excuses could hardly be lacking when Austria-Hungary was threatening to involve the continent in war, when France was cherishing the memory of Alsace-Lorraine, when Great Britain was boasting naval supremacy, when the Triple Entente was winning the friendship of Spain. To be sure, in his public statement, the chancellor commented on the effective work of Sir Edward Grey in preserving peace, affirmed that relations with Russia were "friendly" and with France "good," and rejoiced at the solidarity of the Triple Alliance; in secret conferences, however, the international situation assumed so grave a complexion that no real patriot could doubt that Germany might at any moment be called upon to fight for existence. And since a majority of the deputies in the Reichstag were unwilling to be other than patriots, the army bill encountered little opposition, except from the Social Democrats.

The budget commission proved ungenerous only in one detail: it would grant but three of the six new cavalry regiments demanded by the bill. The other provisions were all approved. In addition to the existing forces there were to be raised 18 battalions of infantry, 34 squadrons of cavalry, 7 battalions of foot artillery, 11 of pioneers, 13 of transportation of troops, and 11 of train, a total of 136,000 men (including officers) and 27,000 horses. The annual contingent of recruits was increased by 63,000, and the peace footing will be 661,176 as compared with 544,211 under the law of 1912. When the bill was reported to the Reichstag there was little discussion; even the Social Democrats were thinking more about the financial than the military measures. On June 30 the bill was passed, against the votes of the Social Democrats, Poles, and Alsatians; and in addition, the three cavalry regiments struck out in committee were restored by vote of the Right, the National Liberals, and almost all of the Centre.

THE NEW TAXES. It was easy to decide on a larger army; it was quite a different thing to pay for it. The cost of carrying the new law into effect was estimated at almost a billion marks, of which 435,000,000 would fall due in 1913; 285,000,000 in 1914, and 178,000,000 in 1915. Over and above this non-recurring expenditure, the running expenses of the army would be increased in 1913 by 54,000,000 marks, in 1914 by 153,000,000 marks, and in 1915 by 186,000,000. To cover the extraordinary defense contribution, i.e., non-recurring direct tax on property at the rate of $\frac{1}{2}\%$ on all estates exceeding 10,000 m. and of 2% on incomes exceeding 50,000 m. For the recurring expenditures, funds would be raised from a stamp-tax, and an inheritance-tax. In the heated controversy which these proposals engendered, two issues were fundamental. In the first place the Social Democrats were extremely anxious to inaugurate imperial graduated income, inheritance, and property taxes; while at the other extreme the Conservatives were determined to combat both inheritance and property taxes; and in between were the National Liberals, who would rather tax the property and inheritances of agrarian nobles than touch the incomes of

their own constituents, the industrial bourgeoisie. In the second place, the advocates of states-rights, in the Bundesrat as well as in the Reichstag, regarded all imperial direct taxation, whether of income, inheritance, or property, as an encroachment upon the prerogatives of the states, and a dangerous innovation. For a time, the Centre joined with the National Liberals in calling for an imperial property tax; to this the chancellor set his veto. The augmentation of the matricular contributions of the states was opposed by the same two parties. Finally a property-increment tax was decided upon as a compromise in which all parties except the Right could concur. A vexatious detail remained to be settled. Would the princes of the empire be liable to the new taxes? In deference to the Conservatives, the National Liberals, at the last moment, cast a deciding vote in favor of exempting the princes, to the utter disgust of the extreme Left. The third reading of the entire finance law—including the defense contribution, the property-increment tax, the stamp-tax, and the sugar tax,—was passed on June 30. The Social Democrats were favorable to the defense contribution, and the property increment tax as the beginnings of taxation of the rich, but opposed the augmentation of the war treasure, the exemption of the princes, the stamp tax, and the continuation of the burdensome sugar tax. The Poles and Alsatians voted in the negative from force of habit. Against the property increment tax the Right protested in the name of states-rights and registered a feeble protest with its 63 negative votes. Only the National Liberals and the Centre seemed thoroughly satisfied, and the leaders of both parties were effusively congratulated by the chancellor.

A word should be said in explanation of the defense contribution and the property increment tax. (1). The contribution reaches both income and property, and is expected to bring in almost a billion marks. An estate, including real and personal property, is liable to the defense contribution if it exceeds 10,000 m., but is exempt up to 30,000 m. if the possessor has not more than 4000 m. income, and up to 50,000 m. if he has less than 2000 m. income. Incomes are taxed for the contribution if they exceed 5000 m. An estate is taxed .15% on the first 50,000 m., .35% on the next 50,000 m., .50% on the next 100,000 m., and 1.50% on amounts exceeding 5,000,000 m. (2). The property increment tax is reckoned every three years on the amount by which a man's total real and personal property has increased during that period, and will fall due first on December 31, 1916. Up to 20,000 m. estates are exempt, and up to 10,000 m. increments are exempt. The scale of taxation is on a basis of a double progression, i.e., in proportion to the estate and in proportion to the increase. The rate on increments of from 10,000 m. to 50,000 m. is 0.75%; from 50,000 m. to 100,000 m., 0.90%, and so on until 1.50% is reached for increments exceeding 1,000,000 m. But the tax is increased by 0.1% of the increment if the estate exceeds 100,000 m., 0.2% if it exceeds 200,000 m. . . . and 1% if it exceeds 10,000,000 m. In drafting this elaborate scheme the German legislators were not unmindful of the encouragement due to fathers of large families; a paterfamilias with less than 100,000 m. in property and with more

than two children receives a 5% reduction in his tax for the third and each subsequent child.

OTHER BILLS. Two other bills were passed by the Reichstag before its adjournment on June 30. The citizenship bill made it easier for Germans living or born abroad to retain their German citizenship, and created a central bureau in the foreign office to assist Germans who wished to regain their citizenship. The military penal law enabled military tribunals to exercise greater clemency in dealing with the indiscretions of young and intoxicated soldiers; it was especially advantageous in permitting the alleviation of sentences imposed June 27 on seven Reservists and members of the Landwehr who failed to observe due decorum while under the influence of alcoholic stimulants at Erfurt on April 10.

THE KRUPP CASE. The most effective antidote to militarism was the sensational allegation made on April 18 by Dr. Liebknecht, the Social Democratic orator. The great German armament firms, notably, the Krupp family, so often praised as patriotic and public-minded manufacturers of the arms for Germany, were now accused of misinforming the French press in order to stimulate militarism, of obtaining public secrets by bribery and underhand methods, of conspiring with other firms to force up the price of munitions of war. On the following day, April 19, the Centrist Dr. Pfeiffer demanded explanations, and reminded the minister of war that some years ago the Centre had proved that the supposedly patriotic Krupp firm was selling its wares cheaper abroad than to the Fatherland. So unsatisfactory were the explanations offered by the ministry, that on April 21 the Centre brought in a bill requesting the chancellor to appoint a commission of experts and of Reichstag deputies to investigate the foundations of Dr. Liebknecht's charges. The commission was constituted accordingly and met on November 14; but Dr. Liebknecht was debarred and the Social Democrats refused to have anything to do with the commission. In the meantime the military court at Berlin tried seven military officials suspected of complicity in the malpractices of the Krupp firm, and, finding them guilty, on August 5, imposed short terms in prison varying from three weeks to six months. The more interesting phase of the Krupp case began on October 23 with the trial of Maximilian Brandt, a former agent of the firm, and of Otto Eccius, a director, before a Prussian criminal court. Damaging evidence was brought to light, but no such sensational revelations were forthcoming as had been anticipated. Herr Eccius, as "the man higher up," was dismissed with a fine of 1200 m., while Brandt was sentenced to four months in jail.

THE FALL SESSION. The Reichstag as it met on November 25, 1913, had changed in several respects since its first meeting in 1912. Bye-elections had increased the numerical strength of the Left by 5; Social Democrats had 111 votes instead of 110, the Progressives 44 instead of 41, the National Liberals 45 instead of 44, while the Centre had dropped from 90 to 89, the Conservatives from 45 to 42. While the Left had gained in numbers, it had not fulfilled the expectations awakened in the last general election. On important measures, such as the army and finance bills, the National Liberals had shown more of a tendency to cooperate with the Centre than with the Social Demo-

crats; and there seemed to be no possibility of a working coalition of the Left. The Centre, moreover, had manifested surprising vitality, had ventured to censure the government, had passed its bill for the suspension of the Jesuit law, and had been the party to take up Dr. Liebknecht's Krupp revelations. In their congress at Metz, August 16-23, the Catholics of Germany exhibited unexpected unanimity, and expressed themselves with undiminished vigor on the question of education and the Jesuit law, and resolved to carry forward the work of social amelioration outlined by Ozanam and Kolping. The Social Democratic Congress, on the other hand, faced a serious situation. In bye-elections the Socialist vote had fallen off in alarming fashion. *Vorwärts* had lost thousands of subscribers. The great leader of the German Social Democrats, August Bebel (q.v.) was no longer there, and his place could hardly be filled by Fritz Ebert, who was chosen to succeed him as party chairman. Worst of all, the split between opportunists and revolutionaries was daily growing wider; dependence on National Liberal votes in the general elections had resulted in weaker protests against militarism, more of a tendency to compromise; and in voting on the advisability of inaugurating "mass strikes" to obtain franchise reform in Prussia, only 160 of the delegates assembled at Jena were for immediate action, while 240 were willing to adopt the "principle," but not as yet the practice, of the general strike.

When the Reichstag met again on November 25, a government bill for the more effective prevention and punishment of espionage came up for consideration, and, significantly enough, it was with the Centre and not with the National Liberals, that the Social Democrats joined in protesting against the press restrictions in article ix. The budget for 1914 next attracted attention. It balanced at 3,403,011,671 m. But presently, budget, espionage, and all were forgotten in the exciting discussion of the Zabern incident.

THE ZABERN INCIDENT. Zabern, or Saverne, a quiet little town of Alsace, garrisoned by the 99th Infantry, had been terribly excited by the brutal attitude of the German officers. Lieutenant von Forstner, a young nobleman, remarked that he would be willing to give 10 m. out of his own pocket to any German soldier who would run his bayonet through an Alsatian blackguard (Wackes). In spite of popular indignation von Forstner was upheld by his superiors, Colonel von Reutter and General von Deimling, with the result that German soldiers were hooted at by the French populace, and von Forstner was afraid to appear in the streets without a corporal's guard. The young nobleman still further earned the hatred of the town by striking with his sword a lame shoemaker, who had laughed at him in the street. In Paris, *Le Matin* appeared with furious denunciations of German tyranny in Alsace-Lorraine. In Strassburg and Metz great demonstrations were instituted to show sympathy for the townsmen of Zabern. In Berlin the Social Democrats held anti-militarist meetings. The Reichstag, too, was agitated. When questioned on December 1, the chancellor said he would give full explanations later. On December 3 he was interpellated on the subject. In the meantime the minister of war, von Falkenhayn, had obtained the emperor's instructions to uphold

the army without compromise or apology; it was therefore with confidence and assurance that he asserted the necessity of maintaining the authority of the army against the insults of Francophil Alsations, and despite the criticism of political agitators. A tumult of shouts and jeers expressed the Reichstag's answer; and on the following day all parties except the Conservatives joined in a vote of no confidence (293 to 54). The trouble might have been averted by a prompt removal of the offensive von Forstner; it was now lessened by promises that the officers would be court-martialed. In order to prevent further outbreaks, the troops were removed from Zabern to Hagenau, some 25 miles away, and, incidentally, the tradesmen of Zabern lost the lucrative custom of the German soldiers. The interesting question now arose, whether the chancellor would resign after the vote of censure. Had the other parties joined with the Social Democrats in unyielding opposition, they might have forced Herr von Bethmann-Hollweg to retire. As it was, the Social Democrats and Alsations were left alone, and Herr von Bethmann-Hollweg was enabled triumphantly to declare that the position of the chancellor depended solely upon imperial prerogative, and that the privilege recently acquired by the Reichstag of expressing judgment after interpellations implied no control of the government. See also SOCIALISM.

FOREIGN AFFAIRS. In the international entanglement which grew out of the Balkan wars Germany played no inconsiderable part as the loyal ally of Austria-Hungary, and on the other hand, the German ambassador at London worked with Sir Edward Grey in the interests of European peace—at least, that was the report of the chancellor. In general, German influence seemed to have been exerted in favor of Turkey, and many comments were made upon the fact that the Turkish army had been drilled by German officers, while the opposing armies had profited by French instruction. An impression to the contrary was created in September by King Constantine's eulogy of the German army and expression of his indebtedness to German tactics—a eulogy so extravagant that it aroused jealousy in Paris. The Triple Alliance seemed to be stronger, if anything, after the wars than before, although the interests of Austria-Hungary had almost involved the Triple Alliance in war, and a difference of opinion had arisen after the Treaty of Bucharest, when, instead of seconding Austro-Hungarian demands for revision, Emperor William had exchanged congratulatory telegrams with King Charles of Rumania. One reason for the vigor of the Triple Alliance was to be sought in the fact that Herr von Jagow, who, as ambassador at Rome, had helped to renew the Triple Alliance a year ago, was now German foreign minister, having succeeded Kiderlen-Waechter, who died December 30, 1912. Anglo-German relations were characterized throughout the year by mutual endeavor to eliminate misunderstandings between the two countries. In discussing foreign affairs in the Reichstag, von Bethmann-Hollweg voiced his approval of the British policy in Turkey, and especially in Asia Minor. The improvement in Anglo-German relations was marked by an attempt to moderate Anglo-German naval competition. On February 7, Admiral von Terpitz, after consulting with Herr von Jagow, announced that the 16-to-10 relation

was quite acceptable. About a month later Mr. Churchill, speaking before the Commons, suggested that Germany and Great Britain might agree to a year's interruption of their naval-construction programmes or otherwise lessen their rivalry, provided a ratio of 16-to-10 could be maintained. In commenting on the idea, the German press was inclined to look to Great Britain to take the initiative in bringing about the "naval holiday." For a discussion of Franco-German relations, see FRANCE, *History*; also the *Zabern Incident* (*supra*). See also NORWAY, *Foreign Affairs*.

OTHER EVENTS. Among the numerous celebrations which took place during the year, the Prussian centennial celebration of the War of Liberation (March 10), the Emperor's Jubilee or 25th anniversary (on June 13), the Kehlheim festivities (on August 25), and the centennial of the "Battle of Nations" at Leipzig (on October 16), might be mentioned. On this latter occasion a pretentious monument was dedicated in the presence of German premiers and representatives from Austria, Sweden, and Russia. The French press could not well sympathize with such jubulations, and contented itself with ridiculing the inartistic character of the Leipzig memorial.

ALSACE-LORRAINE. The Zabern incident, noted above, was not the only cause of ill-feeling between the empire and the Reichsland. The year began with a series of inflammatory speeches delivered by Herr Wetterlé, a deputy in the Reichstag. Almost at the same time the *Souvenir Alsacien-lorrain*, a society whose function was to keep alive the memory of dead heroes, was dissolved under article 2 of the association law, because it disseminated a spirit of hostility toward the German government. In May the government asked the Bundesrat to pass two exceptional laws, one of which would allow the Statthalter to dissolve dangerous societies with greater expedition. The other would add a provision to the press law relative to the prohibition of French publications in Alsace-Lorraine. The second Chamber of the Diet protested most strenuously against these measures and expressed the "conviction that the peaceful development of our land will be seriously disturbed by the government's policy of exceptional legislation, and that the people of Alsace-Lorraine can and will of their own accord safeguard their political relations against all nationalist chauvinism."

SOCIALIST LOSS IN BADEN. In the elections to the Landtag on October 21, the Social Democratic vote was 12,000 less than in 1909, while the Centre gained 25,000, the Progressives 9,000, the National Liberals 4,900, and the Conservatives 3,000. Although the Social Democrats lost 7 of their 20 seats, the coalition of the Left still retained a majority of 3 votes, and was able to elect the president.

END OF THE BAVARIAN REGENCY. When the Bavarian Landtag met on September 29, after almost eleven months' recess, it soon became evident that there was an overwhelming sentiment in favor of terminating the regency, notwithstanding the request made on December 22, 1912, by the Prince Regent Ludwig (who succeeded Prince Regent Luitpold in 1912) that the termination of the regency should not be considered at present. On October 30, 1913, the chamber passed a bill designed to depose the mad King Otto I. by a vote of 122-27. The

LUDWIG III, KING OF BAVARIA
PROCLAIMED KING NOVEMBER 5, 1913

decision was supported by the upper chamber or Reichsrat, and after physicians had testified to Otto's insanity, the throne was declared vacant. The prince regent thus became King Ludwig III. of Bavaria, and on November 12 received homage. The Landtag then returned to a consideration of the budget. Some criticism of the ministry was occasioned by the augmentation of the civil list by over a million marks. The Centrist premier, Baron von Hertling, made an important statement in connection with the budget, indicating that the Clericals were disposed to turn their attention from militarism to social legislation. "It is now high time," he said, "to let armaments rest, for the German people can assume no more burdens for many years to come." The Socialists, he said, should come forward with practical proposals for social reform, instead of opposing everything. The premier also stated that he would consider proposals for the reform of the Reichsrat, which at present consists mostly of nobles.

THE GUELPHS AND BRUNSWICK. Between the Guelph family, now represented by the Duke of Cumberland, and the reigning Hohenzollerns, a feud has existed ever since Prussia dispossessed the Guelphs in Hanover in 1866. A reconciliation was foreshadowed on February 10, if not accomplished, by the engagement of the emperor's only daughter, Princess Victoria Louise, to Prince Ernst August, the son of the Duke of Cumberland. On February 15 Prince Ernst joined the Prussian army and as a Prussian officer took an oath to do or countenance nothing in violation of Prussia's territorial integrity. On May 24 the young couple were married. During the summer "the Guelph question" entered on a new phase; the query became, would Prince Ernst be allowed to ascend the throne of Brunswick—now in regency—without explicitly renouncing the claims of his family to Hanover. The crown prince of Prussia seemed inclined to demand a renunciation. The Kaiser, however, was more indulgent to his new son-in-law. In October a Prussian bill was passed by the Bundesrat rescinding the decision of 1907 that no Guelph could ascend the throne of Brunswick without making a formal renunciation of Hanover. Prince Ernst August was therefore allowed to become Duke of Brunswick on November 3, and promised loyalty "to the empire and to its exalted head. Soon afterward the Guelph party in Brunswick dissolved.

MECKLENBURG-STRELITZ. Another attempt to establish a representative diet in the grand duchy shipwrecked on the obstinacy of the aristocracy. The proposed constitutional reform favored by the grand duke, provided for only 10 elected delegates in an assembly of 22; even this measure of democracy was unacceptable. "The estates," as the grand duke said, "have been unable to agree to subordinate their private wishes and class interests to the common good."

PRUSSIA. Unexciting elections to the Landtag were held on May 15. In spite of the inequitable three-class electoral law, the Social Democrats made gains, but still remained an insignificant minority; while the Conservatives by combining with either Centre or National Liberals could command a majority. The budget for 1914-15, discussed in December, balanced at 4,846,239,109 m. The expropriation of the Poles has been referred to above. It was sig-

nificant that when the emperor visited Posen late in August, the nobles were polite and the people resentful.

WÜRTTEMBERG. In the new Landtag which met on January 9 as a result of the elections of December, 1912, Right and Left were evenly balanced. In electing the *präsidium* the Centre-Conservative *bloo* was successful, but subsequently a bye-election gave the other side of the House a majority. Premier von Weizsäcker made it clear, that in case the empire should suspend the Jesuit law, Württemberg would revive its own legislation on the subject.

OTHER STATES. In Saxony a National Liberal was elected president of the lower chamber of the Landtag, and a Conservative vice-president. In Schwarzburg-Rudolstadt plans for constitutional reform were announced by Freiherr von der Recker; in addition to the present Landtag (consisting of 4 representatives of large taxpayers and 12 delegates elected by direct secret suffrage) there are to be 12 representatives of the professions.

GERMANY, ARCHÆOLOGY OF. See **ARCHÆOLOGY.**

GHEENT EXPOSITION. See **EXPOSITIONS.**

GIBRALTAR. A British crown colony, naval and coaling station, and *entrepôt* of British trade with the North African Arab states; a narrow peninsula extending southward from the southwest coast of Spain. Its area is 1½ square miles and its population (1911) 19,586, exclusive of military. Naval and military barracks, hospitals, etc., occupy the southern part; the naval harbor is on the west side. There are no trade returns, Gibraltar being practically a free port. Revenue and expenditure for 1911 were £94,573 and £73,390 respectively (£80,929 and £76,410 in 1910). The governor and commander-in-chief (General Sir A. Hunter in 1913) is sole administrator, without executive or legislative councils. A sanitary commission has in charge the drainage, water supply, etc. Their debt stood December 31, 1911, as £159,779.

GIFTS AND BEQUESTS. The following list of gifts and bequests in 1913 is compiled from the record kept by the *Chicago Tribune*. It does not include notice of any gifts and bequests of less than \$5000. An exception to this rule is made in the case of one bequest of an unusual nature. In October, Mrs. Martha Fouse, a negro woman who was born a slave in Cass County, Mo., and sold from her parents when a very young girl, and who had accumulated in domestic service a considerable amount of money, contributed a scholarship valued at \$2000 to the Curry Normal and Industrial Institute at Urbana, O. This is the largest gift ever made by any colored woman for educational purpose to any institution.

The total sum of gifts and bequests in 1913 was much less than that contributed in 1912. The record of the latter year was, however, phenomenal, and greatly exceeded the gifts and bequests made in previous years. In 1913 the record shows \$169,851,442, compared with \$241,821,719 in 1912. These totals of course include only donations of a public character. If the entire amount given and bequeathed were known, it would probably reach nearer five hundred than one hundred and fifty million.

Of the total amount given in 1913, \$76,791,109 represents donations and \$93,050,333 bequests. The total sum was distributed as follows: To

charities of various kinds, \$85,109,640; to educational institutions, \$57,601,997; to religious bodies, \$21,233,300; to art museums, galleries, and municipal improvements, \$23,560,505; and to libraries \$2,162,000. The largest individual amount was contributed by Andrew Carnegie, \$6,620,000. The total contributions made by Mr. Carnegie for various purposes up to the present time, amounted to \$209,200,800. John D. Rockefeller gave in 1913 \$1,462,500. Mrs. Russell Sage gave \$243,500. J. Pierpont Morgan left by will \$800,000 for religious purposes and for charity. The value of his art collection, and that of Mr. Benjamin Altman, cannot be estimated in money.

Abbot, A. S., Bon Homme, S. D., gift to Yankton College, \$15,000.

Abbott, Carrie T., Cambridge, Mass., will to Radcliffe College, \$5000.

Abingdon, Ill., gift for library by John Mosser, \$10,000.

Abington Hospital, Philadelphia, Pa., gift by G. W. Elkins, \$185,000.

Academy of Design, will by Benjamin Altman, \$100,000.

Adler, Simon, Baltimore, Md., gift to charity, \$10,000.

Albion, Mich., gift of school building by Frank L. Besse, \$15,000.

Albion College, will by Manly Chase, \$5000; will by Thomas W. Palmer, \$50,000.

Alderson, I. C., Alderson, W. Va., will to Baptist school, \$10,000.

Alexander, Mrs. C. B., New York, gift to University of California, \$75,000.

Allegheny City, Pa., gift to library by Andrew Carnegie, \$150,000.

Allen, Katharine, Worcester, Mass., will to Worcester Technical Institute, \$100,000; will to Memorial Hospital, \$100,000; will to Tuskegee Institute, \$5000; will to Hampton Institute, \$5000; will to charities, \$100,000.

Allen, Sarah J., Sanford, Me., will to hospital, \$10,000.

Allen, Mrs. T. J., Boston, Mass., will to Harvard University, \$30,000.

Allentown, Pa., will to Allentown hospital by Edward Harney, \$200,000.

Allerbury, W. W., New York, will to charities, \$145,000.

Altman, Benjamin, New York, will to Metropolitan Art Museum, collections valued at \$15,150,000; will to charity, \$250,000; will to Academy of Design, \$100,000; will to Educational Alliance, \$50,000; will to employees, \$30,000,000.

Amen, H. P., Exeter, N. H., will to charity, \$5000.

American Museum of Natural History, gift by Jessie Greer, \$90,000.

American Natural History Museum, gift for south polar exploration, \$22,500.

American Museum of Safety, gift by Andrew Carnegie, \$5000.

American Seamen's Aid Society, gift by Mrs. Russell Sage, \$25,000.

Smith, Richard, Philadelphia, Pa., will for playgrounds, \$849,235.

Smith, Mrs. R. M., New York, gift to Y. M. C. A., \$500,000.

Smith College, gift by Mrs. W. D. Straight, \$50,000; gift by various donors, \$950,000.

Smithsonian Institution, gift by Leander D. Chamberlain, \$35,000.

Smitt, Mrs. A. M., New York, gift to Y. M. C. A., \$500,000.

Snell Seminary, gift by Edward Poulson, \$30,000.

Snyder, N. Z., Bethlehem, Pa., will to Franklin and Marshall College, \$25,000.

Social Service Hospital, Los Angeles, Cal., gift by various donors, \$75,000.

Society for Prevention of Cruelty to Animals, will by Victor M. Osborn, \$100,000.

Solomon, William, New York, gift to American Union of Hebrew Congregation, \$10,000; gift to Hebrew Union College, \$5000.

Southern Methodist University, gift by various donors, \$800,000.

Southmayd, Emily F., New York, gift to Bar Association, \$100,000.

South polar exploration, gift by American National History Museum, \$22,500; gift by National Geographical Society, \$22,500.

Spears, May C. W., Brookline, Mass., will to Y. M. C. A., \$25,000.

Spires, Mary H., Los Angeles, Cal., will to Occidental College, \$10,000; will to Y. M. C. A., \$10,000; will to charity, \$25,000.

Steel workers at Pittsburgh, Pa., gift of Braddock Hospital, \$100,000.

Stetson University, will by Henry M. Flagler, \$75,000.

Stewart, David D., St. Albans, Me., gift to Colby College, \$75,000.

Stewart, L. M., Yarmouth, Me., will to Yarmouth Academy, \$5000.

Stewart, Levi M., Minneapolis, Minn., will to charity, \$5000.

Stewart, P. B., St. Albans, Me., gift to Dartmouth College, \$75,000.

Stimpson, Charles M., Los Angeles, Cal., gift to Bible Institute, \$100,000; gift to Y. M. C. A., \$39,000.

Stokes, Anson P., New York, will to charity, \$36,000.

Stotesbury, Mrs. E. T., Philadelphia, Pa., gift to Y. W. C. A., \$50,000.

Straight, Mrs. W. D., New York, gift to Smith College, \$50,000; gift to Y. M. C. A. and Y. W. C. A., \$300,000.

Strauss children, New York, gift to charity, \$185,000.

Stuart, John, Elburn, Ill., gift for good roads, \$50,000.

Sturgeon, W. O., Boyne, Kan., gift to charity, \$35,000.

Sturgeon Bay, Wis., gift of library by Andrew Carnegie, \$12,000.

Summer donations to Harvard University, \$101,887.

Sutherland, Emily F., N. Y., will to Yale University, \$125,000.

Sutton, W. H., Norristown, Pa., will to schools, \$3000; will to church, \$3000.

Syracuse University, gift by Mrs. Russell Sage, \$34,000.

Sweetser, Thomas W., Salem, Mass., will to charity, \$10,000.

Swift, Mrs. G. F., Chicago, Ill., gift to colored Y. M. C. A., \$5000.

Tag Day, Chicago, Ill., \$41,952.

Talles, Maria E., New York, will to charity, \$22,500; will to Cornell University, \$25,000.

Taylor Orphan Asylum, will by Stephen Bull, \$20,000.

Terre Haute Hospital, will by James McGregor, \$50,000.

Thessalonian Institute, gift by Leander D. Chamberlain, \$100,000.

Thompson, F. S., New York, will to Princeton University, \$500,000; will to Mercy Hospital, Chicago, Ill., \$200,000.

Thompson, Olivia, Denver, Colo., will to charity, \$22,000; will to Colorado Law School, \$75,000.

Thorkeld, Sisere, Fulton, Mo., gift to Woods College, \$40,000.

Thornton, Mrs. F. F., gift to Vassar College, \$75,000.

Thwaites, R. G., Madison, Wis., will to library, \$10,000.

Tierney, Thomas F., Philadelphia, Pa., will to charity, \$2200.

Tilden, Edward, Chicago, Ill., gift to charity, \$10,000.

Toberman, J. B., Los Angeles, Cal., will to church, \$20,000.

Tobey, Frank, Chicago, will to charity, \$15,000.

Townsend, Burden, Troy, N. Y., will to church, \$10,000.

Trask, Mrs. Spencer, Saratoga, N. Y., will for Home for Artists, \$3,000,000.

Treadwell, R. D., Portsmouth, N. H., will to charity, \$7000.

Trinity College, gift by Duke Bros., \$1,000,000.

Tuberculosis Hospital, San Francisco, Cal., will by Elizabeth M. Newton, \$150,000.

Tuck, Edward, gift to New Hampshire Historical Society, \$60,000.

Tuck, Mr. and Mrs. E., gift to charity, \$63,000.

Tufts College, will by Hannah S. Moulton, \$25,000.

Tuskegee Institute, gift by Katharine Allen,

- \$5000; gift by V. E. Cornwell, \$10,000; will by Z. R. Cornwell, \$40,000.
- Tuxbury, Alfred C., Saco, Me., will to charity, \$10,000.
- United Lutheran Church, Minneapolis, Minn., gift by James J. Hill, \$50,000; gift by various donors, \$200,000.
- Urbana, Ill., will to library by F. E. Eubaling, \$10,000.
- Utah University, will by James McGregor, \$50,000; for student endowment, \$100,000.
- Van Arde, Frederick, New York, will to charity, \$11,000.
- Vanderbilt family, gift to Y. M. C. A., \$300,000.
- Vanderbilt, A. A., New York, gift to Y. M. C. A., \$2000.
- Vanderbilt, Frederick W., New York, gift to Yale University, \$160,000.
- Vanderbilt, L. W., New York, gift to Yale University, \$160,000.
- Vanderbilt, Mrs. W. K., New York, gift to Babylon (L. I.) Hospital, \$4000.
- Vanderbilt University, gift by Andrew Carnegie, \$1,000,000.
- Van Deursen, Margaret, Middleton, Conn., will to charity, \$150,000.
- Vavet, Louise, New York, will to church, \$16,000.
- Virginia University of, will by George Herndon, \$16,000.
- Von Post, Herman C., New York, will to charity, \$170,000.
- Walte, Fannie P., Cleveland, O., will to charity, \$45,000.
- Wanamaker, John, Philadelphia, Pa., gift to charity, \$25,000.
- Wardwell, Martha W., New York, will to charity, \$20,000.
- Warner, Nate, New York, will to charity, \$50,000.
- Washington College, gift by Andrew Carnegie, \$50,000; gift by various donors, Topeka, Kan., \$200,000.
- Washington and Lee University, will by R. P. Doremus, \$2,000,000.
- Washington University, gift by R. D. Browning, \$1,000,000; will by R. P. Doremus, \$1,100,000; will by Marie C. Gregory, \$50,000.
- Watts, Cal., gift of library by Andrew Carnegie, \$10,000.
- Waupaca, Wis., gift of library by Andrew Carnegie, \$10,000.
- W. C. T. U., gift by H. C. Wisner, \$40,000.
- Weatherley, C. B., Burlington, Vt., will to charity, \$200,000.
- Wellesley College, gift by unnamed donor, \$100,000.
- Wesley Hospital, gift by Asa G. Cander, \$150,000.
- Western Reserve College for Women, gift by Mr. Mather, \$50,000; gift by alumnae, \$80,000.
- Western Union Theological Seminary, gift by N. W. Conkling, \$100,000.
- Weyerhaeuser, Frederick, St. Paul, Minn., gift to charity, \$80,000.
- White, John B., gift of library to Kansas City, Mo., \$40,000.
- White, Theodore G., New York, will to charity, \$80,000.
- Whitman College, will by H. N. Lockwood, \$5000.
- Whitney, Morgan, New Orleans, La., will to charity, \$15,000.
- Wilhere, Nellie M., Philadelphia, Pa., will to charity, \$50,000.
- Willamette College, gift by James J. Hill, \$250,000; gift by various donors, \$250,000.
- Williams, Mrs. Nathaniel, Middleton, Del., will to church, \$65,000.
- Williams, Rebecca, Bellefontaine, O., gift for charity, \$100,000.
- Williams College, will by Sarah Patterson, \$100,000.
- Willimantic, Conn., gift to church by various donors, \$12,000.
- Wilmington, Del., gift to Maternity Hospital by Mrs. R. I. Dupont, \$50,000.
- Winans, Helen D., New York, will to charity, \$50,000.
- Winchester, Ky., gift of library by Andrew Carnegie, \$30,000.
- Winthrop, Gordenia, New York, gift to charity, \$15,000.
- Wisner, H. C., Medicine Lodge, Kas., will to W. C. T. U., \$40,000.
- Wood, Mrs. Alan, Conshohocken, Pa., gift to library, \$5000.
- Woods, W. S., Fulton, Mo., gift to Woods College, \$59,200.
- Woods College, gift by W. S. Woods, \$59,200; gift by Sisere Thorkeld, \$40,000; gift by other donors, \$13,000.
- Woodward, Sarah A., New York, will to charity, \$10,000.
- Wooster, University of, gift by L. H. Severance, \$1,000,000.
- Worcester, Mass., gift to Memorial Hospital by Katharine Alien, \$100,000.
- Worcester Technical Institute, will by Katharine Allen, \$100,000.
- World Peace Society, gift by Edward Ginn, \$10,000.
- Wyeth, F. H., Philadelphia, Pa., will to charity, \$55,000.
- Wyman, Ella B., Newburyport, Mass., will to Boston Medical Library, \$85,000.
- Wyman, Mrs. George, South Bend, Ind., gift to charity, \$125,000.
- Wyman, Mrs. G. W., South Bend, Ind., gift to charity, \$5000.
- Yale University, gift by alumni, \$112,000; will by Henry B. Browne, \$100,000; will by Otis K. Dimock, \$125,000; will by Albert Loessel, \$42,000; will by Joseph Lyman, \$80,000; will by J. R. McPherson, \$318,000; will by Emily F. Sutherland, \$125,000; gift by unnamed donor, \$10,000; gift by L. W. Vanderbilt, \$160,000.
- Yankton College, gift by A. J. Abbott, \$15,000.

- Y. M. C. A., Monroe, Mich., gift by David Reed, \$5000.
- Y. M. C. A., New York, gift by Mrs. R. M. Smith, \$500,000; gift by Mrs. A. M. Smitt, \$500,000.
- Y. M. C. A., Pawtucket, R. I., gift by Mrs. Smith Grant, \$50,000.
- Y. M. C. A., Pottstown, Pa., gift by John Melg, \$50,000.
- Y. M. C. A., St. Louis, Mo., gift by various donors, \$35,000.
- Y. M. C. A., San Francisco, Cal., gift by John C. Coleman, \$25,000.
- Y. M. C. A., San Jose, Cal., gift by various donors, \$141,000.
- Y. M. C. A., Worcester, Mass., gift by Mrs. M. P. Higgins, \$5000.
- Y. M. C. A. and Y. W. C. A., New York, gift by J. D. Archbold, \$20,000; gift by Mrs. J. D. Archbold, \$5000; gift by C. H. Dodge, \$250,000; gift by Grace Dodge, \$250,000; gift by Mrs. J. W. Gates, \$25,000; gift by H. M. McCormick, \$25,000; gift by Mr. and Mrs. C. H. McCormick, \$25,000; gift by Joseph Milbank, \$10,000; gift by New York Telephone Company, \$25,000; gift by J. D. Rockefeller, \$450,000; gift by J. D. Rockefeller, Jr., \$25,000; gift by Mrs. J. D. Rockefeller, \$25,000; gift by Julius Rosenwald, \$50,000; gift by Mr. and Mrs. Jacob H. Schiff, \$60,000; gift by Mrs. W. D. Straight, \$300,000; gift by various donors, \$2,566,000.
- York, Pa., will for Woman's Home by Anna L. Gardiner, \$400,000.
- Y. W. C. A., Chicago, gift by R. T. Crane estate, \$10,000.
- Y. W. C. A., New Britain, Conn., gift by various donors, \$76,000.
- Y. W. C. A., Philadelphia, Pa., gift by Mrs. E. T. Stotesbury, \$50,000; gift by various donors, \$500,000.

GILLESPIE, GEORGE LEWIS. An American major-general, died September 27, 1913. Born in Kingston, Tenn., in 1841, and graduated from

the United States Military Academy in 1862, he saw active service in the Civil War, and in 1864 was brevetted major for gallant services. He was made lieutenant-colonel in 1865. In the latter year he was appointed chief engineer of the Army of Shenandoah. In 1885 he was president of the Mississippi River commission. During the war with Spain he was assigned to the command of the Department of the East for the defense of the Atlantic Coast. In 1898 he was made brigadier-general of volunteers, and in 1901 brigadier-general of engineers, U. S. A. He was promoted to major-general and retired in January, 1904.

GILLOTT, SIR SAMUEL. An Australian public official, died June 29, 1913. He was born in 1838 in Sheffield, England. At the age of seventeen he removed to Melbourne where, after graduating from Melbourne University, he began the study of law. He built up a successful practice, and also took an active part in political life of Victoria. He was chief secretary of the state of Victoria, and was at one time its attorney-general. He also sat as a member for Melbourne East and the Victorian Parliament.

GOFF, NATHAN. United States senator (Republican) from West Virginia. He was born at Clarksburg, Va. (now West Virginia), in 1843, and was educated at the Northwestern Virginia Academy, Georgetown College, and the University of the City of New York. In 1865 he was admitted to the bar. Two years later he was elected a member of the West Virginia legislature. In 1868 he was appointed United States attorney for the district of West Virginia, to which position he was reappointed in 1872, 1876, and 1880. In 1881 he resigned this position on his appointment as Secretary of the Navy by President Hayes. In March, 1881, he was reappointed district attorney for West Virginia by President Garfield. He was the candidate of the Republican party for governor of the State in 1876, and was defeated. He was elected to the 48th, 49th, and 50th Congresses. In 1888 he was candidate for governor and on the face of the returns was elected. The legislature, which was Democratic, however, seated his opponent. He was appointed United States circuit judge in 1892. For the details of his election to the Senate on February 21, 1913, see WEST VIRGINIA. His term expires 1919.

GOLD. The production of gold in the United States from domestic ores in 1912 was 4,520,717 fine ounces, valued at \$93,451,500. This was a decrease of \$4,174,324 from the production of 1911. The principal gold-producing States in 1912 rank as follows: California, Colorado, Alaska, Nevada, South Dakota, Utah, Arizona, Montana, and Idaho. This was the same relative rank as in 1911, except that a small increase in Alaska and a large decrease in Nevada caused them to change places in order of rank, and a current corresponding increase in Arizona and a decrease in Montana, caused them to change places in 1912 also. No

other State beside the nine mentioned has ever produced over \$1,000,000 in gold since 1910. The most notable increases in gold in 1912 were \$451,496 in South Dakota, \$377,923 in Philippines, \$331,707 in Arizona, and \$292,625 in Alaska. The heaviest decreases were \$4,737,217 in Nevada, \$431,147 in Utah, and \$413,413 in Colorado.

Of the total production in 1912, \$23,019,633 were taken from placer mines, compared with \$23,415,168 taken from these sources in 1911. The chief placer production is in Alaska, where in 1912 it was \$11,990,000, compared with \$12,540,000 in 1911. In California the placer production in 1912 was \$8,645,663, compared with \$8,986,527 in 1911. In 1912 dredging supplied \$11,218,804, compared with \$10,311,589 in 1911. Of the total, California produced \$7,429,955 in 1912, against \$7,666,261 in 1911.

At the end of 1913 the director of the United States mint estimates the production of gold in the world during the year at \$455,000,000, or approximately \$11,000,000 less than in 1912. The United States fell off \$5,000,000, chiefly in Alaska and Nevada. The Transvaal, which fell \$5,000,000 behind its record of 1912, but for the miners' strike in June would have shown a moderate increase. Australasia lost \$1,000,000, which was a continuation of a decline that had been going on for several years. Mexico's production fell off about \$5,000,000, due to the war. On the other hand Canada gained about \$2,700,000 and British India \$1,000,000, and there were smaller gains elsewhere. The mint bureau's final estimate upon the production of gold in 1912 was \$466,000,000.

WORLD'S PRODUCTION OF GOLD, CALENDAR YEAR 1912

Countries	Value
North America:	
United States	\$ 93,451,500
Canada	12,648,800
Mexico	24,500,000
Africa:	
Transvaal	188,293,100
West Coast	7,286,000
French Colonies	2,044,600
Rhodesia	14,226,900
Australasia	54,509,400
Europe:	
Austria-Hungary	2,043,200
France	1,812,100
Germany	78,100
Great Britain	27,800
Italy	11,000
Portugal	2,300
Russia	22,199,000
Servia	251,100
Sweden	20,300
Turkey	500
South America:	
Argentina	107,300
Bolivia and Chile	175,000
Brazil	3,570,600
Colombia	2,971,700
Ecuador	406,500
Peru	492,200
Uruguay	111,000
Venezuela	623,500
Gulana, British	879,800
" Dutch	407,300
" French	3,050,600
Central America	3,030,400
Asia:	
British India	11,055,700
China	3,658,900
East Indies, British	1,352,000
" Dutch	3,387,100
Indo-China	74,700
Japan	4,467,000
Corea	2,852,600
Siam	56,500
Total	\$466,136,100

The gold output in 1913, according to the estimate of the Bureau of the Mint and the Geological Survey, as is shown in the table below, was smaller than in 1912. The decrease is to be ascribed mainly to the declines in the output of Alaska, Nevada, South Dakota, and Utah.

GOLD PRODUCTION IN THE UNITED STATES

	(Value) 1912	1913	Changes
Alabama	\$ 16,400	\$ 8,062	D. 8,338
Alaska	17,198,600	14,783,512	D. 2,415,088
Arizona	3,785,400	3,803,039	I. 17,639
California	20,008,000	20,105,447	I. 97,447
Colorado	18,741,200	18,420,031	D. 321,169
Georgia	10,900	9,881	D. 1,019
Idaho	1,401,700	1,366,605	D. 35,095
Maryland	1,200		D. 1,200
Montana	3,707,900	3,078,202	D. 629,698
Nevada	13,575,700	12,279,131	D. 1,296,569
New Mexico	754,600	844,086	I. 89,486
North Carolina	156,000	111,442	D. 44,558
Oregon	759,700	1,370,987	I. 611,287
South Carolina	15,400	1,985	D. 13,415
South Dakota	7,823,700	7,197,498	D. 626,202
Tennessee	11,500	7,711	D. 3,789
Texas	2,200	120	D. 2,080
Utah	4,812,600	3,400,103	D. 1,412,497
Virginia	800	5,514	I. 3,214

Wyoming	24,300	30,491	I. 6,191
Continental			
U. S.	\$92,989,900	\$87,512,868	D. \$5,477,032
Porto Rico		1,116	I. 1,116
Philippines	461,600	787,039	I. 325,439
Total	\$93,451,500	\$88,301,023	D. \$5,150,477

In Alaska the net decrease of nearly \$2,500,000 was due in part to the exceptionally dry summer of 1913. In Nevada the gold output declined about 10 per cent., or over \$1,300,000. In South Dakota the production of gold declined nearly \$700,000, from the record yielded in 1912. The falling off in Utah was over \$675,000. California retains first rank in the gold output, followed in order by Colorado, Alaska, Nevada, South Dakota, and Utah.

IMPORTS AND EXPORTS. According to the estimates of the Bureau of Foreign and Domestic Commerce, gold imports in 1913 comprised gold valued at \$63,961,609, and the gold exported was valued at \$88,601,200. The gold imported was mainly in the form of ore and bullion, and the exported consisted chiefly of refined bullion and coin.

See also METALLURGY.

GOLD COAST, THE. A British crown colony (24,200 square miles) and protectorate (Ashanti, 20,000 square miles; the Northern Territories, 35,800) on the gulf of Guinea. Population figures (census 1911) are believed to underrate the number of inhabitants, being placed at 853,766 for the colony, 287,814 for Ashanti, 361,806 for the Northern Territories. Capital, Accra (19,585 inhabitants). The gold and gold-dust export in 1911 was valued at £1,071,616. Improvement of railway and other means of transportation, coupled with the passing in 1900 of the concessions ordinance, has done much to develop the mining industry. Cacao export, £1,613,468 (1910, £866,571; 1900, £27,280). Palm kernels, £175,801; palm oil, £128,916. Transportation of large quantities of oil would seem to offer some difficulties in those regions not near a railway; the problem is solved by packing it in casks and rolling it to the Volta (the principal river, navigable to Akuse) or to the nearest seaport. Kola nuts, £93,099. A growing industry is the

cultivation of rubber (£219,447). The government has planted 15,000 trees and is endeavoring to promote a less wasteful method of gathering than that prevailing among the natives. Timber (£138,821) is of importance. The total imports and exports (1911) were valued at £3,784,260 (£2,842,895 to the United Kingdom) and £3,792,454 (£2,453,629 to United Kingdom), respectively. There is a railway from Secondee to Kumasi, a branch line from Brumasi to Prestea, and a line between Accra and Akwapim in operation as far as Pakro. Revenue and expenditure amounted in 1911 to £1,111,632 and £914,501 respectively (£1,006,633 and £924,862 in 1910). Tonnage entered and cleared in 1911, 2,676,440; of which 1,557,686 tons. British governor in 1913, Sir H. C. Clifford (appointed 1912).

GOLDMAN, EDWIN. An English surgeon and educator, died August 13, 1913. He was born in Burgersdorp, Cape Colony, in 1862; educated at Burgersdorp, and at Breslau and Freiburg universities. For eleven years he was assistant at the University Hospital in Freiburg. He made a special study of cancer. He became in 1892 a professor of surgery at the University at Freiburg. He was an associate in an institute for experimental therapeutics conducted at Frankfort-on-Main by Professor Ehrlich. He contributed many articles to medical journals on subjects relating to cancer and other malignant growths.

GOLF. Francis J. Ouimet, by winning the national open championship at Brookline, Mass., stamped himself as the golfing marvel of 1913. Ouimet had played a steady game for several seasons, but had never shown any special brilliancy. His defeat of such splendid players as Harry Vardon and Edward Ray, the British professionals, therefore came as a great surprise to golf followers. Ouimet's score was 72, Vardon's 77, and Ray's 78 in the round to decide a triple tie of 304. Jerome D. Travers captured the amateur title for the fourth time in his career by defeating J. G. Anderson 5 up and 4 to play. Mrs. Gladys Ravenscroft of England won the American women's championship, defeating Miss Marion Hollis of Westbrook in the final round, 2 up.

The English open championship was won by J. H. Taylor who made the 72 holes in 304 strokes. Edward Ray, the 1912 champion, was second with 312, and Harry Vardon and M. Moran tied for third with 313. The English amateur championship was captured by H. H. Hilton, who defeated R. Harris 6 up and 5 to play. The English women's championship was won by Miss Muriel Dodd who defeated Miss Chubb 3 up and 2 to play. The French open championship went to George Duncan and the amateur title to Lord Charles Hope.

The American team championship of the Intercollegiate Golf Association was won for the sixth year in succession by Yale, which defeated Williams in the finals by 6 matches to 3. The individual winner was Nathaniel Wheeler of Yale who was the victor over John Marshall, Jr., of Williams, 3 up and 2 to play. In dual college matches Yale defeated Princeton and Cornell, Princeton defeated Cornell; Williams defeated Princeton and Cornell, and Dartmouth defeated Williams. The western intercollegiate championship was won by Chicago, with Illinois second.

GOODWIN, FORREST. Representative in Congress from Maine, died May 28, 1913. He was born in Skowhegan, in 1862; graduated from Colby College in 1887; studied law at Boston University Law School, graduating in 1890; and then engaged in the practice of law. He was a member of the Maine House of Representatives in 1899; was elected to the Maine Senate in 1903, serving as president of that body in 1905; and was elected to the 63rd Congress in September, 1912.

GORELL, JOHN BARNES, first baron. An English jurist, died April 22, 1913. He was born in 1848 and was educated at Peterhouse College, Cambridge. He became a barrister in 1876; Queen's Counsel in 1888; and a bencher of the Inner Temple in 1896. From 1892-1905 he was judge of the Probate Divorce and Admiralty Division of the High Court of Justice, and president of this court from 1905-08. He was created First Baron Gorell of Brampton in 1909.

GORKY, MAXIM. See *RUSSIA, History.*

GOTCH, FRANCIS. An English physiologist, died July 14, 1913. He was born in Liverpool in 1853; educated at Cambridge; and in 1883 was appointed demonstrator of physiology at Oxford University. He became professor of physiology at Liverpool in 1891, where he remained until appointed Waynflete professor at Oxford in 1895. This chair he held until his death. During this period he carried on many investigations, in particular concerning the excitable tissues of the muscles and nerves. In 1892 he was elected a fellow of the Royal Society. He published many papers on the physiology of nerves and muscles.

GOVERNMENT. See section so entitled under various countries.

GOVERNORS' CONFERENCE. The sixth annual meeting of the governors of the States, the so-called "House of Governors," met in Colorado Springs on August 26, 1913. The chief question discussed related to conservation and good roads. The conference was opened with addresses by Governor Ammon of Colorado, and Mr. Lane, Secretary of the Interior. Reports were read by the commission of rural credits and the Lincoln highway. Governor Baldwin of Connecticut delivered an address on the expenses of candidates, and Governor Lister of Washington spoke on the State department of efficiency. There was a discussion of State legislatures by Governors O'Neal of Alabama, and Hodges of Kansas. The session closed on August 30. The meeting of 1914 will be held in Madison, Wis.

GRAPES. See *HORTICULTURE, passim.*

GRAPHITE. The greater part of the graphite consumed in the United States was derived from foreign deposits. The total domestic production in 1912 was 2445 short tons of natural graphite, valued at \$207,033, and 6448 short tons of manufactured graphite, valued at \$830,193. In 1912 as in 1911 the total production of crystalline graphite came from Alabama, New York, and Pennsylvania. The production of this graphite has decreased continuously since 1909. Its decrease resulted mainly from the closing of numerous graphite properties. The destruction by fire of the mill of the Allen Graphite Company of Quenelda, Ala., was the cause of part of the decrease in 1912. Amorphous graphite was produced during 1912

in small quantities in Michigan, Nevada and Wisconsin. Nevada and Wisconsin products are very small. In the fiscal year 1913, the imports of graphite into the United States amounted to 26,222 short tons, valued at \$1,972,177. Of this quantity the greater part came from Ceylon. Other countries sending considerable amounts were Mexico, Canada, and Korea.

GREAT BRITAIN. THE UNITED KINGDOM OF GREAT BRITAIN AND IRELAND. A constitutional monarchy. Capital, London. Great Britain proper is England, Scotland, and Wales.

AREA AND POPULATION. The area of the United Kingdom, including inland water, is stated at 121,105 square miles. Attached to the United Kingdom, but not forming a political part thereof, are the Isle of Man and the Channel Islands, with an aggregate area of 302 square miles. The United Kingdom and these islands together constitute the British Isles, with an area of 121,407 square miles. England and Wales comprise 58,340 square miles; or in land area alone, 58,029 square miles; Scotland, 30,405 square miles, or in land area 29,782. By divisions, the area, the population according to the censuses of April 1, 1901, and April 3, 1911, are shown in the following table:

	Sq. m.	Pop. 1901	Pop. 1911	Dens.
England	50,874	30,813,048	34,045,290	669
Wales	7,466	1,714,800	2,025,202	271
Scotland	30,405	4,472,103	4,760,904	156
Ireland	32,360	4,458,775	4,390,219	136
U. Kingdom..	121,105	41,458,721	45,221,615	373
Isle of Man....	227	54,752	52,016	229
Channel Islands	75	95,618	96,899	1,292
British Isles..	121,407	41,609,091	45,370,530	374

The population figures represent persons present; no census of the population resident is taken in the United Kingdom, and therefore the figures above do not include British soldiers, sailors, and merchant seamen abroad.

As estimated for June 30, 1912, the population of the United Kingdom was 45,662,646; June 30, 1913, 46,035,570. Increase of population (decrease in Ireland since 1841) has been as follows, according to census returns:

	E. & W.	Scotland	Ireland	U. K.
1801.....	8,892,536	1,608,420
1811.....	10,164,256	1,805,864
1821.....	12,000,236	2,091,521	6,801,827	20,893,584
1841.....	15,914,148	2,620,184	8,176,124	26,709,456
1861.....	20,066,224	3,062,294	5,798,967	28,927,485
1881.....	25,974,439	3,735,573	5,174,636	34,884,648
1891.....	29,002,525	4,025,647	4,704,750	37,732,922
1901.....	32,527,843	4,472,103	4,458,775	41,458,721
1911.....	36,070,492	4,760,904	4,390,219	45,221,615

The percentage of population in the several divisions and the percentage of increase from 1891 to 1901 and from 1901 to 1911 are shown below:

	1841	1891	1901	1911	'91-'01	'01-'11
England ...	56.1	72.8	74.3	75.3	12.1	10.5
Wales	3.4	4.0	4.1	4.5	13.3	18.1
Scotland ...	9.8	10.7	10.8	10.5	11.1	6.5
Ireland	30.7	12.5	10.8	9.7	*5.2	*1.6

* Decrease.

The population in the Isle of Man and the Channel Islands is almost stationary. It was 148,915 in 1911, as compared with 150,370 in 1901, 147,842 in 1891, and 143,126 in 1851.

In 1911, the number of males and females were, respectively: England, 18,421,298 and 17,623,992 (or 1073 females to 1000 males); Wales, 1,024,310 and 1,000,892 (997 females to 1000 males); Scotland, 2,308,839 and 2,452,065 (1062 females to 1000 males); Ireland, 2,192,048 and 2,198,171 (1003 females to 1000 males).

In England and Wales, the percentage of population in urban districts in 1911 was 78.1, as compared with 77.0 in 1901, 72.0 in 1891, and approximately 50.2 in 1851. In Scotland, the burghal population in 1911 was 66 per cent. of the total, as compared with 58.5 per cent. in 1901. A large part of the total population increase was in the suburbs of Glasgow. The population of the City of London (675 acres) in 1901 was 26,923 and in 1911 19,658; administrative county of London (74,816 acres), 4,536,267 and 4,521,685. "Greater London" consists of the City of London and Metropolitan police districts, or the administrative county of London and a wide belt of suburban towns and districts known as the "outer ring"; the outer ring had in 1901 2,045,135 inhabitants and in 1911 2,729,673; Greater London 6,581,402 and 7,251,358. The area of Greater London in 1911 was 443,424 acres, or 693 square miles. On June 30, 1913, the estimated population of the administrative county of London was 4,518,191 and of Greater London 7,411,885.

The population of the larger cities (after London) of England and Wales was returned as follows by the 1911 census: Birmingham, 525,833 (with districts annexed November 9, 1911, 840,202); Liverpool, 746,421; Manchester, 714,333; Sheffield, 454,632 (with area annexed April 1, 1912, 459,916); Leeds, 445,500; Bristol, 357,048; West Ham (in the outer ring), 289,030; Bradford, 288,458; Kingston-upon-Hull, 277,991; Newcastle-upon-Tyne, 266,603; Nottingham, 259,904; Stoke-on-Trent, 234,534; Salford, 231,357; Portsmouth, 231,141; Leicester, 227,222; Cardiff (in Wales), 182,259; Bolton, 180,851; Croydon (in the outer ring), 169,551; Willesden (in the outer ring), 154,214; Rhondda (in Wales), 152,781; Sunderland, 151,159; Oldham, 147,483.

In Scotland the population of the larger burghs was as follows, according to the 1911 census: Glasgow, 784,496; Edinburgh, 320,318; Dundee, 165,004 (in 1913, Broughty Ferry, which had 11,058 inhabitants in 1911, was annexed to Dundee); Aberdeen, 163,891; Govan, 89,605; Paisley, 84,455; Leith, 80,488; Greenock, 75,140; Partick, 66,849; Coatbridge, 43,286; Motherwell, 40,380; Kirkcaldy, 39,601; Hamilton, 38,644; Clydebank, 37,548; Perth, 35,854; Kilmarnock, 34,728; Falkirk, 33,574; Ayr, 32,986.

The larger cities in Ireland, with population according to the preliminary returns of the 1911 census, are: Dublin, 309,272 (with suburbs 403,030); Belfast, 385,492; Cork, 76,632; Londonderry, 40,799; Limerick, 38,403; Waterford, 27,430.

The following table shows the rate, per thousand of population, of births, deaths, and marriages, that is, persons married:

	E. & W.	Scot.	Ire.	U. K.
Births 1902.....	28.5	29.3	23.0	28.0
" 1907.....	26.5	27.7	23.2	26.3
" 1911.....	24.4	25.6	23.2	24.4
" 1912.....	23.8	25.9	23.0	24.0

	E. & W.	Scot.	Ire.	U. K.
Deaths 1902.....	16.8	17.3	17.5	16.5
" 1907.....	15.1	16.6	17.6	15.5
" 1911.....	14.6	15.1	16.5	14.8
" 1912.....	13.3	15.3	16.5	13.8
Marriages 1902.....	15.9	14.2	10.4	15.1
" 1907.....	15.9	14.3	10.3	15.2
" 1911.....	15.2	13.4	10.7	14.6
" 1912.....	15.5	13.7	10.6	14.8

The number of passengers that arrived in or left the United Kingdom (exclusive of passengers from or to Europe) is officially reported as follows (the last column of the table shows the number of British passengers from and to the United States):

	British	Allens	Total	U. S.
Arrivals 1908.....	172,043	170,879	342,922	65,418
" 1911.....	192,718	157,711	350,429	72,082
" 1912.....	199,181	141,515	340,696	71,493
Departures 1908.....	263,199	123,212	386,411	96,869
" 1911.....	454,527	168,898	623,425	121,814
" 1912.....	467,666	189,169	656,835	117,310

PUBLIC EDUCATION. In England and Wales, on July 31, 1912, departments in the ordinary public elementary schools numbered 32,234; accommodations, 6,862,876; teachers, 41,307 men, 122,676 women; pupils enrolled, 3,044,384 boys, 2,992,986 girls; average attendance 88.79 per cent. On the same date, there were 51 higher elementary schools, having accommodations for 14,104, with 464 teachers, 10,806 pupils (average during the year), and an average attendance of 90.1 per cent. For public secondary education, there were on January 31, 1912, 995 schools recognized for grant, having full-time teachers, 5106 men and 4974 women, part-time teachers 3326, and full-time pupils 89,004 boys and 76,613 girls. At evening and similar schools, pupils enrolled in 1912 numbered 784,984; in day technical classes, 11,758; in technical institution courses, 1289; in art classes, 3250; in schools of art, 41,677 (20,359 males and 21,318 females). Teachers are trained at pupil-teacher centres, training classes, and hostels. The public schools here treated are not to be confounded with the many private institutions known as "the public schools."

In Scotland, for the year ended August 31, 1912, there were 3164 public primary schools in receipt of grants, with accommodations for 1,042,703 pupils, 820,171 pupils enrolled, and 733,792 in average attendance; 196 higher grade schools in receipt of grants, with 24,544 pupils enrolled and 24,201 in average attendance; 1152 continuation classes, with 144,815 scholars. Teachers in elementary schools (day and higher grade) numbered 5362 men and 15,096 women. There were 56 secondary schools claiming grant, with 1175 teachers, 20,484 students enrolled (11,956 boys and 8528 girls), and 19,458 in average attendance.

In Ireland, on December 31, 1912, public primary schools in operation numbered 8255, with 13,213 teachers, accommodations for 769,697 pupils, an enrollment of 668,974, and an average attendance of 499,038.

PAUPERISM. The mean number of paupers, and the ratio per thousand of estimated population, relieved on January 1 and on July 1 preceding (exclusive of casual paupers and insane) are reported as follows for England and Wales:

	Indoor		Outdoor		Total *	
	No.	Ratio	No.	Ratio	No.	Ratio
1903.....	203,604	6.2	506,029	15.4	709,473	21.6
1908.....	237,549	6.8	535,452	15.4	772,346	22.3
1912.....	248,035	6.9	403,552	11.2	650,626	18.0
1913.....	245,638	6.7	407,018	11.1	652,528	17.9

* Deductions are made from total for paupers who received both indoor and outdoor relief on the same day.

Of the above paupers, the following were able-bodied adults:

	No.	Ratio	No.	Ratio	No.	Ratio
1903.....	37,561	1.1	61,393	1.9	98,954	3.0
1908.....	46,135	1.3	65,040	1.9	111,175	3.2
1912.....	50,884	1.4	69,333	1.9	120,217	3.3
1913.....	49,957	1.4

A number of paupers, especially outdoor paupers, ceased to be dependent on poor relief in 1911 in consequence of the partial removal of the pauper disqualification for old-age pensions.

In parishes in Scotland, the poor of all classes (including lunatic poor) in receipt of relief on January 15, 1912, were 67,581 paupers and 41,658 dependents; on January 15, 1913, 67,767 and 40,535. In unions in Ireland, the number of paupers in receipt of relief at the close of the first week of January, 1912, was 79,636 (of whom 4609 were able-bodied adults receiving indoor relief); at the end of the first week of January, 1913, 78,799 (4312).

AGRICULTURE. The following table shows the total area in acres (including rivers and lakes, but not including foreshore and tidal waters) and the total cultivated area (in the first week of June) in Great Britain, in Ireland, and in the United Kingdom, including the Isle of Man and the Channel Islands:

	Gr. Britain		Ireland		U. K.	
Total acres.....	56,804,166	20,734,124	77,724,044			
Cultivated 1898.....	32,477,031	15,191,818	47,793,140			
" 1902.....	32,387,959	15,240,135	47,752,744			
" 1907.....	32,243,447	14,629,593	46,997,546			
" 1911.....	32,094,658	14,707,808	46,926,500			
" 1912.....	31,996,024	14,673,778	46,793,747			

The area in acres under the principal crops in the first week of June, 1912, is reported as follows (figures for the United Kingdom include those for the Isle of Man and the Channel Islands):

	Gr. Britain	Ireland	U. K.
Corn crops:			
Wheat	1,925,737	44,855	1,971,801
Barley	1,648,201	165,367	1,816,426
Oats	3,029,054	1,046,000	4,096,111
Rye	60,943	7,765	68,779
Beans	285,989	1,421	287,511

Swine....	2,655,797	1,323,957	3,992,549	4,250,013

* Including Isle of Man and Channel Islands.

MINING AND METALS. The following table shows the quantity of coal and metal produced in the United Kingdom, with estimated value at the place of production:

	1901	1906	1911
Coal	219,046,945	251,067,628	271,891,899
£ 102,488,552	91,529,266	110,783,683	
Pig iron*.....	4,091,908	5,040,360	5,020,510
£ 12,826,622	17,623,966	16,146,340	
Pig iron†.....	3,836,739	5,143,500	4,605,762
£ 12,026,762	17,984,603	14,490,872	
Fine copper, t.	532	749	392
£ 37,661	69,385	23,461	
Metallic lead, t.	20,034	22,335	17,990
£ 254,599	392,445	254,259	
White tin, tons	4,560	4,522	4,873
£ 556,571	819,377	931,917	
Zinc	8,418	8,539	6,098
£ 149,174	235,819	153,593	
Silver....ounces	174,466	148,341	118,458
£ 19,764	19,083	12,123	
Bar gold....oz.	6,225	1,871	425
£ 22,042	6,569	1,415	
Total	£ 128,379,747	128,680,513	142,797,662

* From British ores. † From foreign ores.

Excepting part of the pig iron, the metals named in the foregoing table were produced from British ores. The output of coal in 1912 was 117,921,068 tons.

FISHERIES. The value of fish (exclusive of salmon) landed on the coasts of the United Kingdom is reported as follows:

	1911	E. & W.	Scotland	Ireland	U. K.
Fish, wet...£	8,051,486	£3,060,574	£315,679	£11,427,739	
Shellfish....	273,012	67,355	58,406	398,773	
Total.....	8,324,498	3,127,929	374,085	11,826,512	
1912					
Fish, wet...£	8,884,347	£3,588,584	£306,786	£12,779,717	
Shellfish....	326,534	67,594	60,581	454,709	
Total.....	9,210,881	3,656,178	367,367	13,234,426	

Value for the United Kingdom of the principal catches in 1912: Herrings, £3,705,476; cod, £1,971,994; haddock, £1,936,489; hake, £617,340; soles, £479,272; whiting, £301,280; turbot, £299,-

934; skates and rays, £277,332; mackerel, £253,808; ling, £155,250.

COMMERCE. Total imports, imports re-exported, and net imports (that is, imports for home consumption) have been valued as follows (exclusive of specie and bullion, of foreign merchandise transhipped under bond, and of diamonds from the Union of South Africa):

	Total Imports	Re-exports	Net Imports
1902.....	£528,391,274	£ 65,814,813	£462,576,471
1907.....	645,807,942	91,942,084	553,865,858
1910.....	678,257,024	103,761,045	574,495,979
1911.....	680,157,527	102,759,134	577,398,393
1912.....	744,640,631	111,737,691	632,902,940

For the same years, the value of diamonds exported from the Union of South Africa to the United Kingdom (not included above) were as follows: 1902, £5,380,390; 1907, £8,828,805; 1910, £8,290,367; 1911, £8,267,044; 1912, £9,089,905.

Imports of gold and silver specie and bullion (not included in above table): 1902, £31,393,345;

1907, £73,072,439; 1910, £71,422,077; 1911, £62,987,500; 1912, £69,467,185.

Total exports, re-exports of foreign and colonial produce, and domestic exports (that is, exports of United Kingdom produce) have been valued as follows (exclusive of specie and bullion and of foreign merchandise transhipped under bond):

	Total Exports	Re-exports	Dom. Exp.
1902.....	£349,238,779	£ 65,814,813	£283,423,966
1907.....	517,977,167	91,942,084	426,035,083
1910.....	534,145,817	103,761,045	430,384,772
1911.....	556,878,432	102,759,134	454,119,298
1912.....	598,961,130	111,737,691	487,223,439

For the same years, the exports of gold and silver bullion and specie (not included above) were: 1902, £26,125,206; 1907, £67,786,858; 1910, £64,724,213; 1911, £57,024,077; 1912, £64,871,488.

Total imports of merchandise and domestic exports of merchandise in 1911 and 1912 are shown by classes in the following table:

	Total Imports		Domestic Exports	
	1911	1912	1911	1912
I. Food, Drink, and Tobacco:				
Grain and flour.....	£ 75,760,943	£ 88,496,284	£ 3,573,905	£ 4,238,820
Meat, including animals for food.....	49,722,183	49,079,559	1,023,361	1,102,582
Other food and drink.....	22,268,918	24,726,379
1. Non-dutiable.....	73,638,263	77,319,259
2. Dutiable.....	59,561,830	59,333,614
Tobacco.....	5,284,918	6,359,115	2,171,394	2,618,967
Total.....	263,953,137	280,587,831	29,037,578	32,685,808

* Other than machinery and telegraph and telephone wire. † Including parcel-post goods not liable to duty.

In the table of imports and exports by classes, the exports include only domestic merchandise. Re-exports (that is, exports of foreign and colonial merchandise), under the same classification were as follows in 1911 and 1912 respectively: I. Food, drink, and tobacco, £14,311,306 and £15,093,809; II. Raw materials and articles mainly unmanufactured, £59,957,708 and £67,286,032; III. Articles wholly or mainly manufactured, £28,344,970 and £29,189,219; IV. Miscellaneous and unclassified, £145,150 and £168,631; total, £102,759,134 and £111,737,691.

Leading imports not specified in the table were as follows in 1911 and 1912, in thousands of pounds sterling: Wheat, 38,910 and 46,455; sheep wool, 32,978 and 33,235; butter, 24,601 and 24,354; unmanufactured rubber, 18,334 and 21,580; sawn or split fir, 15,147 and 16,463; bacon, 14,463 and 14,456; fresh and refrigerated beef, 11,134 and 13,674; maize, 10,713 and 13,593; refined sugar, 14,353 and 13,371; tea, 12,983 and 13,126; unrefined sugar, 12,233 and 11,778; broad stuffs (silk), 9306 and 9912; fresh and refrigerated mutton, 9576 and 9699; copper (excluding manufactures of), 7840 and 9203; tin (block, etc.), 8739 and 8970; eggs, 7968 and 8395; cheese, 7140 and 7415; undressed leather, 5446 and 6518; oats, 5391 and 6338; iron ore, 5646 and 6028; wheatmeal and flour, 5277 and 5519; dressed leather, 4303 and 4561.

Leading domestic exports not specified in the table were as follows in 1911 and 1912, in thousands of pounds sterling: Cotton piece goods, 90,513 and 91,624 (including white bleached 24,171 and 25,964, gray unbleached 24,355 and 24,618, dyed in the piece 20,479 and 20,052); coal, 36,521 and 40,494; cotton yarn, 15,663 and 16,222; woolen tissues, 13,303 and 14,124; worsted tissues, 9315 and 9029; textile machinery, 6779 and 7043; tin plate, 6843 and 6833; linen piece goods, 5642 and 6121; woolen and worsted yarn, 6477 and 5899; herrings, 4913 and 5114; pig and puddled iron, 3889 and 4674; boots and shoes, 3599 and 4203; sulphate of ammonia, 3820 and 3991; cotton thread for sewing, 3978 and 3910; linen thread, 2200 and 2296.

The following table shows the value of merchandise consigned from and to foreign countries and British possessions, in thousands of pounds sterling; imports for consumption, or net imports, are discriminated from total imports, and domestic exports, or exports of United Kingdom produce, from total exports:

	Total Imports		Net Imports	
	1911	1912	1911	1912
From for. c'tries	508,898	558,627	455,608	503,174
From Br. poss.	171,260	186,013	121,946	129,800
Total	680,158	744,640	577,398	632,903
	Total Exports		Dom. Exports	
	1911	1912	1911	1912
To for'gn c'tries	384,937	407,418	295,275	310,131
To Br. possess'n.	171,941	191,543	158,844	177,093
Total	556,878	598,961	454,119	487,223

* Re-exports in excess of imports to unknown countries were about £55,000 in 1911 and £71,000 in 1912.

Net imports and domestic exports consigned from and to the principal countries, in thousands of pounds sterling:

	Imports		Exports	
	1911	1912	1911	1912
United States	110,782	123,401	27,519	30,066

Total, including others	577,398	632,903	454,119	487,223

* Including Federated Malay States. † Imports do not include diamonds. ‡ Including Formosa.

SHIPPING. Total net tonnage entered and cleared, with cargo and in ballast (exclusive of the coasting trade):

Entered	British	Foreign	Total
1902 *	32,182,909	17,287,802	49,470,711
1911	40,777,476	28,387,039	69,164,515
1912 †	44,291,842	31,898,774	76,190,616
Cleared			
1902 *	32,250,174	17,570,500	49,820,674
1911	41,107,978	28,636,848	69,744,826
1912 †	44,374,946	31,891,483	76,266,429

* Exclusive of tonnage for war purposes to and from South Africa. † A large part of the increase in 1912 is due to a change in the mode of recording vessels calling at foreign ports in the course of a voyage from one port in the United Kingdom to another.

In 1912, the steam tonnage entered was 74,214,458, cleared 74,325,361; the total tonnage entered with cargo was 46,348,082; cleared, 62,036,529. Leading foreign tonnage entered, in thousands, in 1911 and 1912 respectively: German, 7012 and 7761; Norwegian, 4751 and 5524; Dutch, 2861 and 3027; Swedish, 2657 and 2991; French, 1733 and 1888; Spanish, 1426 and 1516; Belgian, 1702 and 1488. American tonnage entered in 1911 was 220 thousand and in 1912 798 thousand. In 1911 and 1912, total net tonnage arrived in the coasting trade, 62,508,897 and 61,807,618 (British, 58,247,243 and 57,030,903); departed, 62,096,225 and 61,914,781 (British, 57,905,596 and 57,149,153). Merchant marine of the United Kingdom (including Jersey, Guernsey, and the Isle of Man). December 31, 1912: 12,382 steamers, of 10,992,073 tons net and 18,197,117 gross; 8510 sail, of 902,718 tons net and 982,060 gross; total, 20,892 vessels, of 11,894,791 tons net and 19,179,177 gross, as compared with 21,072 vessels, of 11,698,508 tons net and 18,808,459 gross December 31, 1911. During the year the number of steamers increased 140, and the number of sailing vessels decreased 320.

COMMUNICATIONS. The length of railway line open to traffic in the United Kingdom on December 31, 1912, was 23,441 miles (13,139 double track or more, 10,302 single track), compared with 23,417 miles of line at the end of 1911 and 22,152 at the end of 1902. Length of line in England and Wales open to traffic December 31, 1912, 16,223 miles (10,855 double track or more, 5368 single); Scotland, 3815 (1603 double or more, 2212 single); Ireland, 3403 (681 double or more, 2722 single). Total paid-up capital of railway companies in the United Kingdom December 31, 1912, £1,334,964,000 (£1,324,018,000 December 31, 1911); average rate of dividend or interest, 3.52 per cent. (3.59); gross receipts, £128,553,417

(£127,199,570), of which £110,499,654 in England and Wales, £13,508,301 in Scotland, and £4,545,372 in Ireland; working expenditure, £81,224,343 (£78,617,824), of which £70,499,876 in England and Wales, £7,882,512 in Scotland, and £2,841,955 in Ireland; net receipts, £47,329,074 (£48,581,746); proportion of working expenditure to gross receipts, 63 (62).

During the year the principal railway construction in the United Kingdom was in the development and reconstruction of lines at, or in the neighborhood of, the terminals in the great cities. In London particularly the work was designed to facilitate interchange arrangements and communication between suburb and suburb. For example, the District Railway Company was making extensive alterations at Earl's Court Junction so as to avoid the crossing of trains bound for Hammersmith and Putney on the level and beyond and vice versa, so that 100 trains an hour could be handled at this junction. At the Charing Cross station reconstruction was also in progress to facilitate the interchange with the Charing Cross and Hampstead and Bakerloo lines, while at Cannon Street station reconstruction was also in progress. The Charing Cross and Hampstead Railway was forming a loop under the Thames and the Bakerloo extension to Paddington was open on December 1, this line being in process of extension to Queen's Park station to make an open-air junction with the London and North-western. The City and South London Line was being connected by subways with the Charing Cross and Hampstead Railway at Euston, and the Great Northern and City Railway was acquired by the Metropolitan Railway with the result that several important improvements were being undertaken, as well as important reconstruction of the Baker Street junction. The extension of the Central London to the Great Western Railway at Ealing was another link to afford extra facilities to the western suburbs, while the District Railway completed a 5½-mile line to Sutton, with new stations at Merton and Morden. The London and North-western opened a new line to High Street, Watford, which involves the widening of the Brondesbury Viaduct and a new double-track tunnel through Primrose Hill, in addition to reconstruction at Euston. During the year the electrification of the suburban system of the London and South-western was started and a number of lines were continuing electrification for handling the suburban traffic. Barring the metropolitan district, railway progress was not marked in 1913. Station or terminal improvements were in progress at Birmingham and at Stirling station in Scotland and Letchworth, on the Great Northern. The widening of the Great Central between Wrawley Junction and Brocksby, a distance of 5½ miles involving reconstruction of bridges and stations, made progress, while the South-eastern and Chatham Railway was extending its Dover station. The loop built on the London and North-western Railway, northeast of Coventry, was being extended and the list of other smaller extensions and connections included, according to the *London Engineer*, the Swaledale Light Railway, the Elsternham-Thaxted branch of the Great Eastern Railway, the Derwent Valley, the Cuffley and Stevenage, with a long tunnel, the £455-Callerton at Newcastle, the Mansfield Railway,

the Kirkstead and Little Steeping connecting the Boston and Grimsby, and Boston and Lincoln lines; the Newcastle-Pontland; and the extension of the South-eastern Railway from Margate to Cliftonville.

Length of tramway and light railway line open at the end of 1912, 2642 miles (2597 at end of 1911 and 1484 at end of 1902), of which 2172 in England and Wales, 305 in Scotland, and 165 in Ireland; paid-up capital, £76,062,966; gross receipts, £14,726,068; working expenses, £8,924,420; net receipts, £5,801,648.

Length of state telegraph and telephone lines March 31, 1912, 62,095, exclusive of the lines transferred by the National Telephone Company, figures for which are not available.

Length of state telegraph and telephone lines March 31, 1911, 61,296 miles; March 31, 1912, 62,095, exclusive of the lines transferred during the year by the National Telephone Company, figures for which are not available. The length of wire transferred by the company, however, has been reported, the total length of state telegraph and telephone wire on March 31, 1912, being 2,610,656 miles, compared with 1,239,095 miles March 1, 1911. Postal telegraph offices in 1912, 11,561 (11,451 in 1911); railway, etc., telegraph offices, 2452 (2449); telephones, 701,125 (121,730). Post offices, March 31, 1912, 24,387; letters delivered in the fiscal year ended March 31, 1913, in millions, 3298.3; newspapers and halfpenny packets, 1281.3; post cards, 899.

FINANCE. The unit of value is the pound sterling, worth \$4.86656. For years ended March 31, the following table shows budget estimates of revenue, actual receipts into the exchequer, and the excess (+) or deficiency (—) of the actual as compared with the estimated amounts:

	Estimates	Receipts	Difference
1903.....	£161,894,000	£161,319,071	—£ 574,929
1908.....	152,835,000	156,537,690	+ 3,702,690
1910.....	162,590,000	131,696,456	—30,893,544
1911.....	199,791,000	203,850,588	+ 4,059,588
1912.....	181,621,000	185,090,286	+ 3,469,286
1913.....	187,189,000	188,801,999	+ 1,612,999

* Including arrears of 1909-10.

For years ended March 31, the following table shows budget and supplementary estimates of expenditure, actual issues out of the exchequer chargeable against revenue, and the surplus (+) or deficit (—) of actual receipts (shown in foregoing table) as compared with actual expenditure:

	Estimates	Issues	Surp. or Def.
1903.....	£195,138,828	£194,251,081	—£2,932,010
1908.....	153,444,231	151,812,094	+ 4,725,596
1910.....	163,171,000	157,944,611	+ 5,606,766
1911.....	174,129,000	171,995,667	+ 2,133,333
1912.....	181,839,000	178,545,100	+ 6,545,186
1913.....	191,556,000	188,621,930	+ 180,069

In the years ended March 31, 1912 and 1913, revenue (exchequer receipts) was derived as follows: Customs, £33,649,000 and £33,485,000; excise, £38,380,000 and £38,000,000; estate, etc., duties, £25,392,000 and £25,248,000; stamps (exclusive of fee and patent stamps), £9,454,000 and £10,059,000; land tax, £750,000 and £700,000; house duty, £2,130,000 and £2,000,000; property and income tax, £44,804,000 and £44,808,000; land value duties, £481,000 and £455,000 (total from these sources, £155,040,000 and

£154,753,000); post office services (including telegraphs and telephones), £25,700,000 and £29,175,000; crown lands, £530,000 and £530,000; receipts from Suez Canal shares and sundry loans, £1,281,497 and £1,418,900; fee and patent stamps, £1,031,000 and £1,066,000; receipts by civil departments, £1,507,789 and £1,589,099; total, £185,090,286 and £188,801,999.

Expenditure (exchequer issues) chargeable against revenue in the years ended March 31, 1912 and 1913, was as follows:

	1912	1913
I. Consolidated Fund Services:		
National debt services		
Interest of funded debt	£24,500,000	£24,500,000
(New sinking fund)	(15,202,702)	(15,000,752)
Road improvement fund, etc.	(4,447,706)	(4,620,303)
Local taxation accounts, etc.	1,709,859	1,172,205
Civil list	9,653,399	9,653,299
Annuities and pensions	470,000	470,000
Salaries and allowances	317,745	320,883
Courts of justice	56,572	56,468
Miscellaneous	523,000	523,450
	325,525	321,625
Total	37,539,100	37,017,930
II. Supply Services:		
Army (including ordnance factories)	27,649,000	28,071,000
Navy	42,858,000	44,365,000
Civil services	46,001,000	51,944,000
(Education)	(18,983,000)	(19,531,000)
Customs and excise	2,297,000	2,324,000
Inland revenue	1,654,000	1,876,000
Post-office services	20,547,000	23,024,000
Total	141,006,000	151,604,000
Grand total	178,545,100	188,621,930

In the foregoing table, the figures for interest of funded debt and for new sinking fund are included in national debt services; the figures for education are included in civil services.

The nominal amount of the funded debt on March 31, 1913, was £593,453,857; estimated capital liability in respect of terminable annuities, £31,519,908; unfunded debt, £36,500,000 (including treasury bills to the amount of £5,000,000, temporarily paid off, but renewable under the revenue act of 1906); total "dead-weight" debt, £661,473,765. As compared with the latter figure, the total dead-weight debt on March 31, 1912, was £674,744,481; in 1908, £711,475,865; in 1903, £770,778,762; in 1900, £628,930,653. In addition to the dead-weight debt there were on March 31, 1913, capital liabilities in respect to sums borrowed under various acts amounting to £54,814,656; the gross debt, therefore, in 1913, was £716,288,421. The year before, on March 31, the gross debt was £724,806,428; in 1908, £762,326,051; in 1903, £798,349,190; in 1900, £638,919,932. The total debt services in the fiscal year 1913 were £24,500,000 (interest of funded debt, £15,000,752, interest of unfunded debt, £1,171,863, terminable annuities, £3,540,175, management of the debt, £186,907, new sinking fund, £4,620,303). The assets on March 31, 1913, were as follows: Estimated market value of Suez Canal shares, £39,015,000; other estimated assets, £3,707,733; exchequer balances at the Bank of England and the Bank of Ireland, £6,329,160; total, £49,051,893.

ARMY. During the year 1913 there was prog-

ress toward realizing the scheme of organization and developing the defense forces of the various colonies. While there was a propaganda in favor of compulsory service, and the president of the National Service League, Lord Roberts, had made speeches in support of such a movement, this was counteracted by the activities of the voluntary service committee, which upheld the present system of recruiting the army. The secretary of state for war, Col. J. E. B. Seely, D. S. O., defined the attitude of the government on this question when he stated, on May 29, 1913, that: "His majesty's government have no intention whatever of adopting a system of compulsory service for fighting units. Far from abandoning the voluntary principles, they intend to foster, encourage, and extend it by every means in their power."

On September 1, 1913, a military aeronautics branch was formed under Brig-Gen. D. Henderson, C. B., while, during the summer, the army manœuvres were held in the South Midlands. Field Marshal Sir J. D. P. French, G. C. B., chief of the imperial general staff, commanded two armies each of two divisions and army troops, in a campaign against a skeleton enemy under Maj-Gen. C. Monro, the object being to train the staffs and administrative services in the handling and movement of large units. In these manœuvres detachments of the territorial forces participated. A four-company organization in battalions was provided for the foot guards and the infantry of the line during the year. Late in the year there was an increase in pay and more liberal provision was made for issuing commissions to non-commissioned officers and men rising from the ranks. Military opinion was more favorable towards the territorial force in 1913 than in previous years, despite the fact that the numbers had fallen off from the previous year, but, at the same time, the number of men whose service had expired was diminishing and increased numbers were attending camp or field exercises.

The organization of the British army is in two lines, a regular army, with its reserve and special reserve, and a territorial force constituted out of the yeomanry and the former volunteers. The regular army, or first line, has as its object the supply of garrisons and field forces for India, Egypt, South Africa, and other foreign districts, and the maintaining of home battalions to supply defense for the troops abroad and to furnish expeditionary forces to be completed to war strength by the reserve, it being the function of the special reserve to make good the wastage of war. The territorial force, or second line, is designed for home defense without obligation to serve abroad, but with the hope that individuals, or units, might volunteer for foreign service at need, and to that end officers and men of this force register in times of peace for "imperial service" in war, there being on October 1, 1912, in addition to several complete organizations, 20,678 officers and men who had so registered and were consequently available for such service.

The number of officers and men on the regimental establishments of the British army, army reserve, special reserve, and territorial force, including all ranks, is shown in the accompanying table on the following page, from the British army estimates for the years 1913-1914.

**BRITISH ARMY
ESTABLISHMENTS AND EFFECTIVES**

	Establishments * 1913-14	1912-13	Effectives Jan. 1, 1913
Regular forces (regimental), home and colonial (including regular establishment of special reserves)	167,868	168,282	161,251
Colonial and native Indian corps	8,765	8,871	8,694
Army reserve	145,000	139,000	141,898
Special reserves (excluding regular establishment)	78,714	89,913	61,048
Militia, U. K.†	636
Militia, reserve division	90	150	94
Militia, Channel Islands	3,166	3,166	12,928
Militia, Malta and Bermuda, and Bermuda volunteers	2,894	2,894	2,770
Territorial force	315,438	316,307	265,867
Isle of Man volunteers	126	126	115
Officers' training corps (officers and permanent staff)	1,009	1,008	791
Total home and colonial establishments	723,160	729,717	647,092
Regular forces (regimental) on Indian establishment	75,897	75,886	77,097
Total	799,057	805,603	724,189

* Exclusive of number voted to cover regimental fluctuations. † Forces dying out. ‡ October 1, 1912.

The organization of the British regular army in 1913, considered by arms was as follows: Cavalry, 31 regiments, divided into three household cavalry, seven of dragoon guards, three of dragoons, six of lancers, and twelve of husars. There were maintained five cavalry depots with a sixth in course of establishment to train the recruits to post and draft for regiments and to take care of matters connected with the reserve and mobilization. The various regiments were also connected in pairs and the regimental establishment consisted of 694 men and 554 horses, plus 83 horses boarded out, a number that was to be increased to 120. The colonial peace establishment was 590 men and 472 horses, while the Indian establishment was 624 men with about 605 horses. The war establishment in the field was for home and colonies, 534 men and 568 horses, and for India, 478 men and 508 horses.
